According to Robert B. Thomas, the good old almanac maker, "sowing may be made when the weather is warm and favorable, and you are pretty sure you will have no more frost." The object to be obtained is a vigorous growth of the plants sown, and this will in all cases insure a vigorous bloom. Hence, in the making of small gardens, such as I have heretofore spoken of under the name of "small city plots," I deem it necessary to state that among the choice flowers, such as would be quite likely to make one or more among your list of plant seeds, there are some which, being impatient of removal, should be planted in the place in which they are to blossom. Among such flower seeds we note the lupines, sweet pea, escholtzia, and various kinds of poppy seeds. You will here do well to notice that many kinds of seeds which bear what are designated as "tap rooted," or straight rooted plants, are not so easily transplanted as are the fibrous form of roots. In transplanting, as a rule remove with your trowel singly all large growing plants. The smaller plants can be lifted with safety by means of a small thin flat shovel, inserted below the roots, and the plants in patches are as safely removed as are single ones. I have removed quite large size linnias by this means, and astors, together with balsams and marigolds. Care and experiments will give you confidence in yourself, and you only need this to make you floral efforts a source always of pleasure to yourself and friends, and not unfrequently of profit.

Having thus well established your annals in the bed

where they are to grow and flower, you have only to tie them neatly to small stakes and leave them to go on growing while you look a little to the half hardy annuals. Those, you have been informed, need the aid of artificial heat to grow and perfect them well, and to assist and stimulate an early germination. You will understand, however, that this is not an absolute necessity of the plant. Yet by starting them in the hot bed you gain some time, and it is a profitable exercise in plant growing, as it gives you confidence in your ability to go on with your newly acquired knowledge of gardening with some promise of success. Many of the half hardy annuals are self sowing; that is, they ripen their seed and it falls to the earth in the autumn like the portulacca. The seeds of this plant remain in the ground during the winter, and in June spring up vigorously. I have had very fine beds of the portulacca which came from seed sown in the fall. You will if you give close attention to the raising under glass of the astor, zinnia, balsam, and several others of this class of plants, gain not only time but magnificent plants, particularly of the zinnia. Here you can try the pot system, and thus you will add to your list many other plants you could not obtain so well by any other means. Use four inch pots, and fill with prepared earth, and sink in the bed to a level with the earth of the same. A few crock shreds should be placed in the bottom of each pot, planting your seed as in ordinary hot bed surface. Your principal care is in not covering delicate seeds too deep. In order to prevent future mistakes, have some thin labels with the names of the seeds sown in the pots, and stick one in each pot for future assistance, as nothing is more annoying to a good gardener than to lose the name of a prized variety of seed or plant. Remember, here, that you need a thermometer within your frame, particularly if you are a new beginner, and remember, again, that the temperature within should in no case exceed seventy-five or eighty degrees. I have successfully treated the cypress vine and thunbergia in this manner, and recommend it as one of the easiest ways for obtaining good plants of these choice and beautiful tender flowers. Leaving you now to proceed with your already acquired knowledge, and your transplanting of plants into their future positions, we will in our next paper carry you through a chapter in the science of garden flowers upon what are called the tender annuals, and what you should do in order to have a fine show of these beauties of the garden.

OLLIPOD QUILL.

Rational Pastimes.

Will our University correspondents kindly send us their most recent catalogues.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

The St. George's Cricket Club held its annual dinner at Sutherland's on Saturday, April 18th, Mr. John G. Dale, the President of the Club presiding. Toasts and speeches were in order and the game of cricket, it was shown, has rapidly increased in this country; nineteen new members were elected. In addition to the usual matches with local clubs arrangements are being made with the clubs at Philadelphia, Boston, Toronto, Syracuse, also a match will be played with the Boston Base Ball Club before their departure for England in July.

PHILADELPHIA, April 9, 1874.

EDITOR FOREST AND STREAM:—

Cricket may be regarded from two points of view—that of the initiated and that of the uninitiated—and it will depend upon which status we see it from, whether the game will appear the very paragon of field sports or a comparatively dull pastime. A thorough cricketer will derive more real enjoyment from a good match than he can get from any other recreation, and a brilliant leg hit, or the capture of a wicket, will excite a thrill which it would be difficult to describe. But with the uninitiated spectators it is very different. They find it difficult at first to understand in what the fascination of cricket consists. It looks to them like an indiscriminate throwing and hitting of balls, which people standing about stop or catch by chance if they can, the performance being varied only by intervals of unmeaning quiescence and idleness. There is, to be sure, a display of violent exertion, and an occasional appearance of danger, but the object to be attained is not apparent. When two men wrestle, or box, or jump, or race, it is easy to see what they are about, and which is the victor. But when people see a stump knocked down or a ball caught, and a man with a bat walking away from the wicket, this conveys to them an idea of superiority or failure, and they hopelessly inquire what it is that represents success. Then the complication of even the salient features of the game—to say nothing of its finer points—subtleties which none but a practical cricketer ever did or ever can understand! There is something indescribably odd in the "overs," when a set of men gravely cross one another, without any apparent reason, only to cross back again and assume their former positions, repeating this performance periodically every five minutes during the whole of a two day's match. It appears like a solemn ceremonial, performed with the greatest decorum by enthusiasts in white apparel, who delude themselves into the idea that they are having fun. If a visitor did not know it was cricket he might imagine it was a traditional celebration of Druidical rites—mysteries which impress the uninitiated very much as the marchings and postures of the acolytes in a great Roman Catholic ceremony affect the puzzled and contemptuous apprehension of the Protestant lookers-on, who, having no key to these elaborate motions, see nothing but unmeaning parade in what the ritualist could give him perfectly intelligible reasons for.

We can pardon the description of Q. K. Philander Doesticks of a cricket match at Hoboken, to which he was inveigled by a friend on the promise that he would see sport:

"Before the game began the players dressed up in baby's flannels from head to foot, and two of them tied bed-quills on their legs. Then they stood about the field promiscuously, and the umpire called out 'play.' Then a serious-looking man threw the ball, which was as hard as a brick, at a lugubrious individual, who stood with a two-handed pudding-stick in his grasp, in front of some sticks that were stuck in the ground. He made a poke at it, but didn't hit it; then he sadly rested from his labors until he had got the ball and were ready to try it over again. The next time he made a dash at the ball with his pudding-stick; this time he hit it; then everybody started to run at once like a pack of lunatic ants, and when they stopped the umpire shouted out 'one run.' Then everybody changed places with everybody else, and they all rested for

five minutes, meantime keeping mournfully still. I expected to hear some one lead in prayer, or strike up a psalm, or do something inspiring of that sort, but no one volunteered any amusement. Pretty soon they resumed the mysteries of cricket, there was more bowling at the unfinished hen coop, and a little while afterwards one was knocked down; then the bed-quilted man retired discomfited and the rest cheered. They persevered in this jocularity until sunset, when the funeral state of things came to an end. But not so the match, for nobody could tell me which side had the best of it, and I heard they expected to spend all the next day at it, but I didn't go, you bet."

Cricket is, nevertheless, a game worthy to be understood and appreciated by every one who acknowledges that a half holiday in the open is a good thing. But more especially is it a game to be learned and played by the rising generation. Apart from the good to be derived from all out-door exercise, it has advantages over all similar sports, and it is a diversion in which a man may be proud to excel, for there is absolutely nothing in it but what the man himself brings to it. It tests what he is worth and what he can do. There is no adventitious interest to be derived from its implements. The simplicity of these—the bat, ball and stumps—give full scope to the subtle play of eyes and hand, of brain and muscle. A sport which involves hard bodily exertion and the chance of sharp knocks and bruises, and which depends for excellence simply on the qualities which make up manly address, activity and force, is, if for no other reason, an admirable one. But there is more than this in cricket. More than in any other game of strength and skill, it requires and develops a variety of powers. Muscular force, speed, quickness, flexibility, agility, are all indispensable, though it is impossible to predict at what moment they may be called for. But the result depends on their being found available when the emergency arises.

Nor is it only the bodily qualities which cricket calls into requisition. Where so many men have to work together and depend on one another, and where the chances of things going wrong are so various, every one requires a fair share of the moral virtues. When twenty-two eager and spirited men meet to try their force, a good deal of forbearance is often required to keep matters pleasant. And when eleven men on a side have to be made the best of in a close contest, it tests not only the generalship of the captain, but the power of co-operation and discipline of the men. To be able to provide against or make the best of the vicissitudes which are often unexpected, but which are at all times possible; to have the self-reliance to act on one's own responsibility, if it be only to decide on a change of bowlers at a critical moment; to have the fortitude to keep up one's spirit and the spirits of the rest, and go on hopefully when things look most unfavorable—in other words, to fight an up-hill battle with judgment, confidence and pluck—these are qualities which cricket has tended to develop in every captain of a school eleven. What to the bystander may seem languid sport, means often that there is a mutual opposition of patience, vigilance, endurance, intellect, and a promptness of adaptation to circumstances slightly altering—but in their alteration most important—which tests the temper and judgment and mettle of a man.

More, perhaps, than in any other game, the result is dependent on the concert of the eleven, while the play of the individual in its special characteristics is distinctively prominent. Each man in succession concentrates on himself, for the time being, the attention and interest of all who are following the game—comrades, opponents and spectators. Each man has his own peculiar career; he makes his good or his bad score; he succeeds or he fails in his bowling or fielding; yet his performance is only one element of the result, and the game is won or lost by no single player, but by the combined total of what all respectively do or fail to do, each at his own post, and at the proper times. With ample opportunity for individual prowess, success can never be solitary or independent. The best batsman is liable at any moment to be run out by his partner, and the best bowler, unless supported by good fielders, obtains but little credit on the score. A man may play with great credit to himself, but he is only one of a side; his success is not merged or lost in theirs, but it is identified with and dependent upon them. No other game has been arranged with such a distribution of individual functions, working together and playing into one another, like the interdependent and correlated movements of an engine, whose distinct parts, endowed with life and volition, must each exert spontaneously its own aptitude, while all must be governed to work freely and sympathetically together. This combination of organization with individual action stimulates what may be called the companionship of discipline. It interests a set of men in themselves and in a common object, closely and generously, while soldiers do not obey their captain more implicitly. Nothing can be heartier than the good will with which an eleven work together who feel that they are getting on well, each man helping the rest to do justice to their side; and even bad fortune will not disturb good temper, where there is nothing to complain of but being fairly overmatched. Let each man do his part well and he will receive full credit for it, but the final result belongs to something beyond his individual honor; the fortunes of his side are of more consequence than anything that can happen to himself, and he plays, not that he may win, but that his side may.

Then, too, there is a wholesome animosity towards the opponents—a contest of rivalry which, while it recognizes the laws of warfare and the decisions of umpires, remits no whit of hostility. Yet this does not prevent the exercise of courtesy and even, at times, of generosity. The practice of cricket depends quite as much on custom and honor as it does on written laws, and it is beneath the dignity of true cricketers to avail themselves of a laxity or ambiguity in the rules to overreach an adversary. The laws of cricket are construed by the vast majority of cricketers rather according to the spirit than the letter, a charity of which it must be admitted the said laws stand sadly in need.

We have spoken rather of the qualifications for cricketers and the aesthetics of cricket than of the game itself; a subject which has been exhaustively treated in the literature of cricket, but which can be best studied practically on the cricket field. We should rejoice to see so many and attractive a field sport widely adopted at American colleges and schools, and our advice to our youthful readers is—If you have heretofore known cricket only by report, lose no time in enlisting in the ranks of the initiated and you will never regret it. And if any whose days for active sport have passed shall be in any degree influenced to encourage cricket among their successors, our object in calling attention to its merits will have been attained.

A. A. O.

—More than ordinary interest is being manifested in regard to the contests on the base ball field this season, especially in reference to the movements of the clubs in the professional arena. Two causes operate in producing this result, the primary one being the fact that owing to the stringent laws enacted by the Professional Association against betting by players, and the prohibition of pool selling on ball fields, the patrons of the game have been led to expect a marked improvement in the integrity of the play during the season. Besides which there is the international series of games to be played in England by the two leading clubs of America, and the tour of these clubs named to take place in July and August next, has attracted more general public attention to the American game of ball than it has ever before elicited. In fact, there is no doubt that this tour and its result of victory achieved on English ground will have the effect of widely extending the popularity of base ball, extended even as it now is. Of course, though the amateur class of ball players form the great majority throughout the country—nearly a hundred to one, in fact—the professionals necessarily attract more of public attention than the amateurs, as by the facilities they have for training and practice they are enabled to display a far greater degree of skill than it is possible for amateurs to do.

Hence the professionals rank highest as the most expert exemplars of the beauties of the game, the Collegians coming next on the list. Last year one of the most exciting series of contests played during the season was that between the rival clubs of the City of Friends, viz, the Philadelphia and Athletic Clubs, the result at the close of the season being the signal success of the new rival club, the Athletics winning but one game out of nine. This year the two clubs again entered the lists, the first game taking place on April 16th, on which occasion, despite cold and threatening weather, fully 3,000 spectators were gathered on the Athletic grounds to witness the game, the result being a decided victory for the Athletics, who defeated the new nine of the Philadelphia Club by a score of 14 to 5. The contestants on both sides were too nervously anxious to win, to play well, and hence the fielding display was below the professional standard. The score of runs, each innings, was as follows:—

Philadelphia.....1 2 0 0 0 0 0 2 0—5
Athletic.....0 0 5 1 4 0 0 4 0—14

Runs Earned—Philadelphia, 0; Athletic, 1.

The new rules were not observed by the Umpire at the special request of the two Captains, and it is questionable whether this fact does not render the game "null and void" as far as its being recorded as a regular championship game is concerned.

—A very fine fielding game was played on the Capitoline grounds on April 16th between the professional Athletics and the amateurs of the Nameless club of Brooklyn, as the appended score shows, the latter playing a beautiful game up to the close of the fifth innings, when the score stood at 2 to 0 only. The runs obtained in each innings, were as follows:—

Nameless.....0 0 0 0 0 1 0 0 0—1
Atlantic.....2 0 0 0 0 3 3 1 5—14

Mr. Remsen umpired the game under the new rules.

—On Saturday, April 18, there was quite a gathering of base ball players at Prospect Park, including members of the Polytechnic Institute and the Nassau Club. The former played a strong field nine and won by 21 to 13 in a seven innings game. The latter defeated a field nine by 22 to 2.

—At the Capitoline grounds on April 18th the Athletics played a practice game with the amateur Powhattans, and won by a score of 20 to 9. The game did not compare with that of Thursday, however.

—On April 14th the veteran Knickerbockers opened play for the season on their enclosed grounds at Hoboken, and though the weather was windy and cloudy they mustered in a field game of ten men on a side, Davis's side defeating Kissam's by 14 to 7 in a six innings contest. It was their thirtieth season's opening, and in all that time they have not missed a season's play.

—On April 18th the Yale College nine entered the field against the professionals of the Hartford Club at Hartford, and after a fine contest of two hours duration they were forced to succumb to the professionals by a score of 12 to 2. The rainy weather on Friday prevented the attendance of a large delegation from town, as the New Yorkers expected that the Hartford field would not be in a condition for use.

—The New Jersey Athletic Club, of Ridgewood, N. J. at a recent meeting elected the following officers:—George E. Moore, President; W. H. England, Vice President; Wheeler W. Phelps, Secretary and Treasurer; G. W. White, Captain. This club will hold their spring athletic meeting during the last week in May and the following programme has been decided upon: One hundred yard race for the championship of the club and a silver cup, 440 yard race and one mile walking match for silver cups. The one mile steeple chase is for a stand of colors presented by the ladies of Ridgewood, now held by A. J. Cameron, of this city, the latter also holds the 440 yard cup. The 100 yard cup is held by C. Harris, of this city, and Thomas C. White, of New Jersey, holds the walking cup. In addition to these events, there will be a 100 yard race between W. W. Phillips and J. Quackenbush, of New Jersey, and the association will offer a silver cup for a half-mile race to be thrown open to all amateur organizations.

—The New York Athletic Club will hold a meeting on their grounds at Harlem on the 30th of May. It is expected and hoped that delegates from Universities, Colleges and all athletic clubs in the United States and Dominion of Canada will be present at a convention to be held on that day to decide the much vexed question of the "Amateur." We understand that the flourishing condition of the New York Athletic Club has enabled them to commence building a new quarter of a mile track on the Westchester shore of the Harlem River. The programme for the proposed athletic meeting will consist of a three-mile walking match for the Amateur Championship of America; one mile running race, 200, 440, and 800 yard running races, and several handicap races.

—The Athletics on the 18th inst., for the second time within one week, succeeded in "Chicagoin" a strong amateur nine, their opponents on the last mentioned occasion being the W. B. Collins Club, who ranked last season as the Amateur Champions of Philadelphia, the Athletics winning by 9 to 0.

—The Athletic and Boston Clubs have signed contracts engaging passage to Europe and back by the American line of steamers. The fare for the excursion there and back will be \$100 in gold. None but members of the two clubs can obtain tickets at these rates or join in the excursion party, so those desirous of doing so will first have to be

elected members; good references will be required, as the managers are determined that the excursionists shall be a party creditable to the country.

—The ball players of the Stevens Institute will hereafter occupy the cricket field foot of Ninth street, Hoboken, on Saturday. They opened play there on April 18th.

—The Baltimore Club defeated the amateur Excelsiors of that city, at Newington Park, on April 14th, the professional nine playing a fine game.

—On April 18th the New Brighton Base Ball players met on their field at Staten Island and had a practice game together.

—The Hartford club will play their first championship match on the 27th of April, where they will meet the Philadelphia nine at Hartford.

—The Zephyrs of Philadelphia played their first game with the Rivertons of Riverton, N. J., on the 18th instant, when the Zephyrs, who had been defeated 45 to 0 by the Athletics on the preceding Saturday, made a close game with their formidable opponents.

Riverton.....4 5 0 2 0 1 0 3 0—14
Zephyr.....1 5 1 0 0 4 1 0—13
Umpire—Mr. R. Eckendorf. Runs Earned—Zephyr 2, Riverton 0.

—The Harvard College nine for 1874 will consist of T. S. Bettens, c.; S. H. Hooper, p.; J. F. Kent, 1st b.; A. G. Hodges, 2d b.; J. A. Tyng, 3d b.; H. C. Leeds, s. s.; C. T. Tyler, 1. f.; — Cutler, c. f.; and — Tower, r. f. Mr. Tyler will be Captain of the nine. They will play Yale and Princeton College nines in May.

—The professional games played up to date are as follows:—

April 13—Philadelphia vs. Eureka, at Philadelphia, 29—5
“ 14—Atlantic vs. Montague, at Brooklyn, 40—2
“ 14—Baltimore vs. Excelsior, at Baltimore, 22—4
“ 14—Philadelphia vs. Villa Nova, at Philadelphia, 32—8
“ 15—Boston vs. Field, at Boston, 34—3
“ 15—Hartford vs. Trinity College, at Hartford, 38—4
“ 16—Atlantic vs. Nameless, at Brooklyn, 14—1
“ 16—Athletic vs. Philadelphia, at Philadelphia, 14—5
“ 17—Chicago vs. Field, at Chicago, 44—3
“ 18—Atlantic vs. Powhattan, at Brooklyn, 20—9

Shot Gun and Rifle.

APRIL IS A CLOSE MONTH FOR GAME

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

—There is on exhibition at Mr. Conlin's gallery, 930 Broadway, a photograph of the Irish eight, the winners of the Elcho shield in the late rifle contest at Wimbledon. The picture, an admirable one, has been sent to Mr. Conlin by Mr. John Rigby, of Dublin, manufacturer of the celebrated rifle which bears his name. Doubtless the portraits of the gentlemen who are to try their prowess at Creedmoor with our own riflemen will be objects of great interest.

—A letter from Minnesota, dated Lake City, April 13th, says:—"The season here is later than it has been for years. The ice in the lake is quite firm, but it is a little shaky. The first robins and blue birds made their appearance on the 7th. Wild geese were seen and began to light on the margin of lake and ponds on the 10th. Ducks in great numbers suddenly made their appearance on the 11th. The ponds being only partially opened, and the remaining ice strong, the very best opportunity is afforded for shooting."

—Our correspondent, "Dick," informs us that a convention of the sportsmen of Tennessee will be held at Memphis on May 1st, in order to take into consideration the game laws of the State, and to organize a State Sportsman's Association. On Saturday, May 2d, there will be a pigeon match under the auspices of the Bluff City club and the Chickasaw jockey club, at the jockey club race course; open to the world; prizes, \$100, \$50, and \$25, in plate or money. Five double birds, eighteen yards rise, one hundred yards boundary. Entrance fee, ten dollars. The contest for the club prize—silver pitcher—will be inaugurated by the members of the club at the close of the above match.

—A letter from Elkhorn, Wisconsin, dated April 15th, says:—"Wild fowl are abundant here now—i. e., blue bills, butterballs, redheads, and occasional widgeon, whistlers, brant, and Canada wild geese. Three guns (muzzle loaders) scored (bagged) sixty-three head on the 13th, and three other guns—muzzle loaders also—bagged ninety-two on the 11th, mostly bluebills, (broadbills, or blackheads, perhaps, on the coast). Our spring shooting, however, is short. Two weeks hence the ducks will have all "moved on," except mallard, woodduck, and teal—all close."

—We are indebted to Thos. J. Higgins, Esq., of Chicago, Ills., for the revised copy of the by-laws of the Kennicott Club of Chicago. The following is a list of officers for 1874:—President, Abner Price; Vice President, M. Benner; Secretary, Joel A. Thinney; Treasurer, D. G. Alston.

—The Manchester Sportsman's Association has just been formed at Manchester, Vermont. Its objects are rifle practice, the protection of game and fish and the restocking of our streams with trout. The are—C. F. Orvis, President; Dr. G. H. Swift, Vice President; H. Eggleston, Secretary; C. J. Wait, Treasurer. Standing Committee—D. H. Simonds, C. F. Swett, C. F. Orvis. We have the finest stream for trout in this State and have many trout in them yet, but

wish to increase them. This association will thankfully receive any donations of reports, books, papers, or letters on the above subjects.

—Of course it is all very fine to go into the wilderness and do your cooking in the most primeval style. A piece of bear stuck at the end of a ramrod and toasted that way has its charms, providing you use a muzzle loading gun, but when it comes to a breech loader that hasn't got any ramrod, where are you? Commend us then to a most neat and portable camping and mining stove, manufactured by Messrs. Pond & Dunklee, of No. 87 Blackstone Street, Boston. There, in a compact form, and everything fitting nicely together, you have a regular range and *balloine de cuisine* all complete. With such an arrangement, you can go into the woods, and providing there is game enough, you can achieve the triumphs of the hunter's *cuisine*. We fancy round just such a stove there will assemble many a group of good fellows this summer in the wild woods, and as they discuss the savory bird or the luscious trout, will think of Messrs. Pond & Dunklee's camping stove.

—The Hudson *Daily Star* of the 16th instant says:—

"The match at Ghent to-day between Leonard Geiger, of this city, inventor of the Remington breech loading rifle, and Judge Kisselburgh, of Ghent, with a muzzle loader, was a triumph for the inventor of the breech loader and this city. The distance shot was 550 yards, at turkeys, and Mr. Geiger killed eight, and Judge Kisselburgh two out of the same number of shots. The gun used by Mr. Geiger is a new one, which he intends using at Creedmoor, L. I., in the friendly match between the Irish eight and American riflemen, in October next."

Twenty-four shots were fired, Mr. Geiger's score being as follows:—0 0 0 0 0 1 1 0 1 0 0 0 0 1 0 1 0 0 1 0 0 1.

The eighteenth shot cut the string by which the turkey was tied.

PORTLAND, April 18, 1874.

EDITOR FOREST AND STREAM:—

On Fast day, April 16, the Maine Shooting Club, of Portland, held their spring match on the usual grounds. The shooting was hardly up to their average, the wind being very strong and the birds unusually smart on the wing. After the pigeons were exhausted the gyro was substituted. Both scores are appended:

	Pigeons.		Gyro.	
	Hits.	Missed.	Hits.	Missed.
Ira Burnham.....	2	4	3	3
H. Soule.....	2	4	6	0
C. Pollister.....	4	2	6	6
C. Stanwood.....	3	3	4	2
M. J. Sullivan.....	4	2	6	3
C. Holden.....	5	1	4	2
W. F. Woods.....	1	5	1	5
F. Morrill.....	1	5	5	1
M. Hodson.....	2	4	4	2
A. Hodson.....	1	5	5	1
J. Sweet.....	6	0	4	2
E. C. Page.....	2	4	5	1
F. Fernald.....	1	5	2	4
James Bond.....	3	3	6	0
S. W. Lewis.....	2	4	6	0

Some excitement was caused by one of the marksmen, who made the somewhat surprising error of mistaking a bystander for a pigeon, and thereupon brought him promptly down in a most sportsmanlike manner.

F. W. S.

HAMILTON, Ont., April 1, 1874.

EDITOR FOREST AND STREAM:—

In your "Answers to Correspondents" of the 2d inst. you say "cleaning rifle is permitted under Wimbledon rules, in a match like the International open to any rifle, although forbidden in matches restricted to breech-loaders alone." Without an explanation it might appear somewhat strange, that wiping out is disallowed to the breech-loader, the time required being a few seconds, whilst it is allowed to the muzzle-loader, the time required being necessarily much longer. At Wimbledon the competitors in matches open to breech-loaders only are formed up in files or pairs, and fire shot and shot alternately, whilst in matches open to "any rifle" the competitors are formed in a square, and fire shot for shot in the order in which their names are called. It is easily perceived, therefore, that the firing would be greatly delayed were cleaning out allowed to the former, except between the ranges, whilst no inconvenience can ordinarily arise by the muzzle-loader taking advantage of the rule. I notice that "T. C. C.," in article No. 2 on "How to Shoot at Long Range," favors what we call the "bead" foresight. After an experience of some years, I am inclined to the opinion that in the clear atmosphere with which we are usually favored in this country, the "aperture" front sight is preferable to the "bead."

The Council of the Ontario Any Rifle Association will hold a meeting shortly to settle the details of the proposed challenge to the Irish Team.

J. J. M.

[In regard to the "bead sight," we have to state that several of our best shots prefer, as does our correspondent J. J. M., the aperture front sight, especially where the light is over bright.—Ed.]

MILTON, Mass., April 20, 1874.

EDITOR FOREST AND STREAM:—

In answer to your correspondent "S. T. J. O.'s" communication, I would say, had he looked closely he would have found the quacking noise of which he speaks to proceed from the *speckled frogs*. They are very musical at this season, but only for a short time. Persons hearing their notes for the first time almost invariably take them for the quacking of ducks, the sounds are so similar. Truly yours, G. S.

Answers To Correspondents.

J. T. B., Fort Wayne, Ind.—The crane mentioned in your letter of last week, page 150, is evidently the Whooping Crane, *grus Americana*.

TAUNTON, Mass.—Is there any law that forbids catching shad with a fly in Taunton River in the months of March, April and May? Ans. None.

COLQUHOUN, Danville, Va.—You ask price of Remington Creedmoor match rifle with loading apparatus—bullet moulds and cleaning fixtures, everything complete? Ans. \$105; address them personally.

FRANK W., Brooklyn.—Is Sullivan County, N. Y., a good place to spend a couple of weeks in July and August? Ans. Few places better. What kind of game in season in those months? Ans. Woodcock.

J. NIXON, N. Y.—Please state when fishing commences, and if around Hell Gate, East and Harlem Rivers are good places? Ans. Bass fishing good in May. John Hilliker, 88th street, Yorkville, is a good man to put you on the ground.

SUBSCRIBER.—Will you kindly inform me of the best load for pigeon shooting for a 10 bore, 10 lb. breech-loader. How would 4½ drachms of powder and 1½ oz. No. 8 shot do? Ans. A proper charge for 30 yards rise—use a concentrator.

Box 190, Schenectady.—I see by your advertising column that you have the "Taxidermist's Manual and Taxidermist's Manual, Brown, and Taxidermy Made Easy." Which would you advise for a beginner? Ans. Buy Combs' new Field Ornithology.

D. W., Boston.—Can I find good trout fishing round and about Mechanics Falls, Me.? Ans. It has been fished a good deal. We should advise you to go to the Rangely region; there is fishing there for 100 rods. It is 83 miles on the Maine Central to Farmington; thence by stage.

TROUT FISHING, Gates ave., Brooklyn.—Please give a good preparation for making boots water-proof? Ans. 6 oz. mutton suet, 6 oz. beeswax, 4 oz. rosin and a pint of linseed oil; melt the three first ingredients together and add the last. Apply on uppers and soles of boots.

J. F. M., Lancaster, Penn.—Are the Long Island trout, such as we see in Fulton Market, propagated artificially, or are they caught regular? Ans. Cultivated in breeding ponds by natural or artificial propagation. W. H. Furman prefers the natural process; other culturists breed artificially.

X. T., Augusta, Me.—Will you give me the address of some reliable firm where lance wood and ferrules for making fly rods can be obtained? Ans. Barton, Alexander & Waller, J. Conroy, and Andrew Clerk & Co. New York; Bradford & Anthony, Boston, and J. B. McHarg, Rome, N. Y.

J. SUTTON, Mich.—Can you tell me how I can preserve crawfish so that I can carry them to the lake for bait in large numbers; they die and become soft and worthless; would scalding in strong brine do; I wish to use the whole fish? Ans. Pack in wet sawdust and salt, or brine. Scalding will discolor them. A little saltpetre added to the salt will improve the pickle.

NELSON J. & EPH, Columbia, Tenn.—Will you favor us with the address of Seth Green, and also the best work on Fish Culture, or such work as will give full information in regard to propagation of what is called Trout here? Ans. 1. At 16 Mortimer street, Rochester, N. Y. 2. Write to Livingston Stone, Charlestown, N. H., for his book, or to J. H. Slack, Bloomburg, N. J., or Thad. Norris, Philadelphia.

BEAVER, Bald Mountain, N. Y.—I have a breech-loading rifle which has become rusty from not sufficient drying after cleaning. What is the best thing to remove rust from the inside of a rifle barrel? Ans. Use gun or paraffine oil, which are the only oils which should be employed. If you cannot get gun oil, use benzine. If the barrel is not badly rusted the oil will clean it. Use a woollen rag and no end of elbow grease. Never use water under any circumstances.

W. E. T., Brooklyn.—1. Near what place in the vicinity of the wooded part of Iowa can I find prairie chicken shooting where deer or antelope can be found, or where good sport can be had with fur, fin and feather? Ans. Norway, Iowa, is 245 miles, on the Chicago and N. W. Railroad. 2. What will be the fare from New York to the place you name, and the price per week for board in a farm house? Ans. The fare is about \$23 and the board \$1 a day.

A. A. W.—Try the water in your lake with the thermometer this summer; let it down to the bottom and draw it up quickly; if it does not show above 70 degrees you may try brook trout in it; no fear of its being too cold. You can get spawn from November to April. Write to Fred. Mather, Honeoye Falls, N. Y. Brook trout rarely get above two pounds weight; they eat other fish; some are not as ravenous as bass or pickerel. The greatest danger is of the other fish you mention—perch, bream, &c.—devouring the young trout, but a small inclosure could be made to keep them in the first year.

LINCOLNSHIRE, Montreal.—Can you inform me whether firing ball from high priced breech-loading shot guns is liable to injure them or not? Ans. Unless it is a matter of necessity we would advise you not to use ball in your shot gun. The weight of powder would be four drachms; the ball should be wrapped in chamois leather, so that it will fight tightly in the cartridge. The cartridge should not be turned down. Are you aware whether any of the manufacturers of breech-loading rifles (American) send out their rifles ready sighted as the English makers do? Ans. They will all test sight their rifles and charge an extra price for the labor.

J. D. CARR, Fall River, Mass.—Two men are found fishing with a snail net in the south Watuppa Lake near this city; they are arrested and their catch, some sixty fish (white and yellow perch and pickerel), together with their net, is taken to the police station and the men are locked up, but after a few hours, are let go, as the authorities can find no case against them. With our present laws here in Massachusetts could not something be done to these men? This net fishing is practiced to considerable extent here? Ans. The prosecution failed of its duty, and the men should have been fined. The only way to prevent violation is by rigorous and impartial dealing. The reason why the N. Y. Society for Protection of Game is held in fear by poachers, &c., is because of its inflexible perseverance in punishing offenders.

CHESTER, N. Y.—We printed last week in this column a recipe for curing raw hides, which please note. Here is another sent to us by our correspondent "Monmouth," excellent for sheep and buckskins, and may answer for caribou and beef-skin, taking more time: Take two parts of saltpetre and one of alum, pulverize them well together; spread the skin carefully, fur side down, before it has got dried; apply the mixtures evenly, being careful to touch every part in sufficient quantity to thoroughly wet the surface after it dissolves; double the flesh side and roll it up closely; put it in a cool place, out of the way of the frost, and let it remain three or four days or more according to thickness; then unroll, and when it gets nearly dry, with a dull knife remove the fat that may adhere in spots, and a little rubbing makes it pliable and fit for use.

W. K. M., Seneca Falls, N. Y.—Will you be kind enough to explain in your columns how to use bird lime after it is prepared, and what book is the best guide for rearing birds other than canaries? Ans. Select some small dry sticks, about eight inches long and as thick as a straw; sharpen one end of them to a flat thin edge, so they can be stuck into a cut in a stake; take a large stick or stake and drive it in the ground; make cuts in its sides suitable to receive the flat ends of the stick; take two of the small sticks and dip them in the lime; when covered, hold one in each hand and roll them between your thumbs and fingers with their sides touching, thus equally distributing the lime; insert their ends loosely into the notches in the stake in the ground, and place a "call bird" in a conspicuous place near the stake; when the birds alight in the sticks they pull loose from the main stick, and when flying away the wings come in contact with the lime and are pinioned to the bird's sides. It does not hold them by the feet, as is generally supposed.

CONOHITSET, Brainerd, Minn.—1. Can you recommend any breech-loaders which have one barrel for shot and the other for ball? Ans. Write to any of our advertisers; they are all reliable. 2. What is your opinion of a gun advertised by Great Western Gun Works, Pittsburg; A. Woodhill's rifle and shot gun, 50-100 calibre, and 12 bore; price \$85? Ans. We do not know the gun. 3. What dog can alone catch and kill a wolf? Ans. A cross between a thoroughbred old-fashioned mastiff and a deerhound. 4. Is it true that first litters of puppies are not good where both parents are of full growth? Ans. No. 5. Have deer ever been grown successfully for profit? Ans. Yes; in this country, Scotland and Germany. 6. A hunter asked me the other day would it pay where land can be had for two dollars and a half an acre or as free homesteads near here to stock a farm with deer. It is supposed they will thrive on meadows and in poplar thickets the year round without other food. The chief expense would be fencing and watching. I refer the question to you. Venison brings here \$5 to \$6 per 100 pounds? Ans. There should at least be enclosed 1,000 acres to breed deer successfully and profitably. The land to be wild, natural and uncultivated, all cover or forest land with springs, and if possible one or two laurel swamps so as to provide food without feeding them artificially through the winter. They must not be interfered with in any way and not touched by the hand of man, as directly you begin to domesticate a deer, it destroys the flavor of the venison and prevents them from breeding successfully. 7. Can any of your patrons—ladies or gentlemen—show a better score at battledore and shuttle cock than 1,596 strikes; two persons playing; single bird. Of course without resting or letting bird once touch the floor? Ans. We refer this question to our lady readers.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, APRIL 23, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

A REMOVAL!

IN journalistic life, as in almost everything else, one is sometimes startled at the rapid changes which take place. The FOREST AND STREAM, now scarcely nine months old, when it occupied its first locality, No. 103 Fulton street, believed that at least for the first two or three years of its existence its original modest habitat would amply suffice its wants. But business grew on apace, and came so fast that in a few months we were absolutely crowded out of our original quarters. If we had not been of an exceedingly sturdy growth we might have succumbed to some of the many difficulties which opposed us in our early months. We have to say months and not years. First, we had almost at our incipency to breast a raging panic. Papers and men and things pretty generally were demolished by it in a most promiscuous way. Next, the FOREST AND STREAM got on fire, and was considerably singed. Lastly, this time of its own free will and volition, it has had its moving. Perils of panic, flood, and fire were but mere child's play when compared with this calamity.

We are perfectly willing to believe how Aladdin, with his wonderful lamp, was able to raise up a splendid palace, perfectly appointed, in a single night, but we defy all the magicians in the world, aided by the cleverest of genii, to remove a printing or publication office of even a cross road newspaper in a month without getting things dreadfully mixed. Thanks, however, to a good deal of system and able management, we have pulled through chaos in quite a commendable way, and are fresh again for another race.

In our short span of life we have then certainly had a liberal share of newspaper troubles. To recapitulate, we have had a panic, a fire, and a removal; *per contra*, we have rediscovered a lake (at least our correspondent, Beverley, has done it for us), we have built up a newspaper, and feel very sure we have secured a host of kind friends. We are glad to offer a welcome to any of our readers in our new office, No. 17 Chatham street, where, in amply spacious quarters, our business will be conducted. Should the Brooklyn bridge not move us, an eventuality just now quite problematical, we trust to issue the FOREST AND STREAM from its present office from to-day for many a long year to come.

—The fish farm of Mr. Alex. Kent, near Green Spring station, on the Western Maryland Railroad, about ten miles from Baltimore, is said to be the only one in Maryland.

OUR FLORIDA EXPEDITION.

LAST November, when we announced our preparations for a thorough exploration of the hitherto impenetrable wilds of Florida, and pledged ourselves to bring to light, if the thing were possible, all the secrets of the Everglades and the mysterious Okeechobee region, we hardly anticipated the full measure of success that has rewarded our efforts. The gentleman who took charge of the expedition possessed all those qualifications indispensable to the accomplishment of its objects which are so rarely found in combination, viz., physical toughness and endurance, pluck, push, dogged perseverance, a thorough knowledge of woodcraft in general and of so much of this portion of Florida as he had acquired by previous visits, skill with the canoe, the rod, and the rifle, and an intelligent acquaintance with drawing, photography, and natural history. To this valuable stock in trade he added an outfit complete in all its requirements of boats, implements, guides, photographic instruments, etc., and the result has been that, while several other parties have attempted the same object, his was the only one that went through to the *ultima thule*. Only those that have surveyed the several routes across the Isthmus of Darien, or explored the interior of Africa, can appreciate the difficulties of this semi-tropical jungle—more harassing than the deserts of Arizona or the canon-rifted fastnesses of Colorado, and, with the single exception of hostile Indians, far more dangerous. Indians there were, too, in that region, and reported hostile, but fortunately they were not malicious; the actual danger was in swamp fevers, and the countless moccasins and other poisonous snakes that infested almost every yard of the route, to say nothing of panthers and the not always harmless alligators.

It may well be inferred that the investigations of our envoy correspondent have been looked for with eager interest by scientific men, and that his collections will occupy prominent place in the cabinets of natural history for which they were procured. We regard the results of this exhibition as of no trifling value. Certainly they were not secured without considerable expense, as well as hardship. Some outline of his journey and his discoveries has been printed in preceding numbers of FOREST AND STREAM; and these letters, together with those that have been furnished by other correspondents within the past six months, embrace nearly every part of the wilderness of Florida accessible or interesting to the tourist or sportsman, both on the coast and in the interior. Last week we published a map of the long sought and much misrepresented Okeechobee Lake, the first ever produced of this largest sheet of water in the south. Its authenticity and accuracy may be relied upon. Its vicinity is uninhabited and uninhabitable by man, although the Indians sought refuge and safe concealment here during the long Seminole war. Nothing of absolute value or special interest seems to be found there, except the India rubber tree, which grows in considerable quantity. To-day we print a list of the birds peculiar to that section of Florida, a list of much value to naturalists. Of course much general information remains to be supplied from the repertoire of our correspondent, all of which we shall print in due time. The photographs and sketches which he has taken will be much prized, and will undoubtedly be published in some form not yet fully decided upon by our correspondent and the editors of this journal.

Now that all occasion has ceased for keeping secret the name of our persevering explorer, it is no more than justice to him to make it public, that the honor of his discoveries may rest where they belong. To the regents of the Smithsonian Institution, the Naturalists' Institute of Salem, and other scientific associations, the name of FRED A. OBER, of Beverley, Massachusetts, *alias* "Fred. Beverley," is not unknown, and we trust that the evidences that he has given the past winter of his capacity and skill in the broad field of natural history will not only commend him still more to their favorable consideration, but assist his rapid advancement.

EXPLORATIONS WEST OF THE 100th MERIDIAN.

DURING the past winter the office work of Lieutenant Wheeler's important survey has been vigorously prosecuted in elaboration of the results of the operations in the field during 1873. Very extensive areas were covered in Colorado, Utah, New Mexico, and Arizona, where complete astronomical and topographical investigations were carried out looking to the preparation of far more perfect maps of the region than have hitherto been attempted; while in other scientific departments research was no less thorough and successful. That which will interest our own readers more particularly was the energy and activity displayed in natural history by the able zoologists and botanists of the survey. Large suites of specimens were secured and beautifully prepared. Mr. H. W. Henshaw's work on the ornithology of the region represents one of the most extensive and valuable series of specimens ever brought out of the west. The literary work in elaboration of the collections will be done by Dr. H. C. Yarrow and Mr. Henshaw—in which fact we have assurance that it will be well done—in connection with several eminent specialists in the departments of entomology, etc. Much interesting ethnological material was secured in the way of skulls, implements, dress and furniture of the aborigines. The field work of the coming season promises still more important results under the direction of Dr. Yarrow, surgeon and naturalist-in-charge, whose admirable organizing

and executive ability will be devoted to the best interests of science, of which he is so well known and successful a cultivator. Volumes showing progress and results to date are already prepared, and under the present management others will be required to fully develop the interesting subject. We trust that this matter, which meets with the most cordial approbation and support of scientific men, and all others whose learning entitles them to the privilege of passing judgment, will be prosecuted under liberal appropriations of an enlightened Congress.

THE MICHIGAN GRAYLING.

FROM the wilds of the northern portion of the southern peninsula of Michigan there had come for many years vague rumors of a strange and beautiful game fish known to the simple backwoodsmen by various names, such as the Au Sable, Muskegon, Hersey, and Michigan trout, the jack salmon, bog salmon, bog trout, and big scaled trout, and these several names that attach to it, according to the respective localities in which it is found, indicate that these observing men have classed it correctly as one of the Salmonidae, although they had no means of ascertaining the specific name by which it has been known in parts of Europe. Now, however, that its true name has been discovered, those who have known it so long by all sorts of titles seem glad to accept it, and to learn that their favorite has a world-wide reputation—that its merits are recognized and acknowledged by men who have never yet seen it; for they have actually changed the name of the post office in Crawford county, which was formerly called Crawford, to *Grayling*! Although the railroad company have not yet seen fit to accept the change, they will doubtless yield to the pressure of popular opinion and rechristen the young town after this popular fish. If other towns regret the precedence taken of them, they may find a name equally appropriate in the generic term *Thymallus*. "Thymallus" is a good name, and sounds well. As Shakspeare says:—"It fills the mouth;" and we trust that it may in the coming months fill the baskets of many an ardent angler.

It is a singular fact that a fish so beautiful, edible, and gamey should have remained so long unknown to our naturalists and anglers. If our memory serves us, it was first described by Professor Cope, of Philadelphia, in 1870, under the name of *Thymallus tricolor*, and Professor Agassiz, in a note dated February, 1873, says that Professor Cope was the only American naturalist thus far that had seen this fish. This statement appeared in a note printed in the New York Times acknowledging the receipt of a pair of these grayling, male and female, which with others had been procured with much difficulty in the January previous for the editor of this paper, the FOREST AND STREAM, at the editor's request, and forwarded to him by D. H. Fitzhugh, Jr., of Bay City, Michigan. They were speared by Indians through the ice in Hersey Creek, and sent to the rooms of the "Blooming Grove Park Association," of which the editor was then secretary, and after having been examined by anglers and experts, both English and American, the greater part were served up at Sutherland's restaurant in this city, at a dinner partaken of by a dozen gentlemen who were curious to test its flavor and edible qualities. They were eaten baked, boiled, and fried, and pronounced better than salmon and of a more delicate flavor than trout. When uncooked the flesh appears almost white, but on the dinner table is of a pale salmon hue. From the fish that were served up at this dinner the spawn had first been carefully removed, and was subjected to microscopic examination. From the size of the eggs, the majority of the party judged that they were near maturity (this was about the 25th of January), and that this fish spawned in February; but the writer of these lines observed that the mass of eggs was extremely glutinous, and insisted that the grayling was an April spawner, and had so stated in his book, the "Fishing Tourist," which was then in the hands of the printer, and which contained the first minute description of this fish and its haunts, habitat, and mode of capture ever published. He was so far compelled, however, to modify his opinion by the opposing weight of wisdom that he altered his statement in the proof sheets, so that it now reads as printed, page 207, "It begins to spawn in February, and continues throughout the months of March and April." As will be seen by the letter of Mr. Mather, printed elsewhere, it has been determined that the grayling spawns about the 20th of April. We do not speak of this to appear wise above our fellows, but to show that, being a spring spawner, the grayling, as Seth Green, Esq., has very truly said, is a most welcome addition to our list of game fish; and anglers ought not only to feel congratulated, but acknowledge the debt of obligation which they owe to the discoverer, whoever he may be.

D. H. Fitzhugh, Esq., to whom we have alluded, very modestly disclaims being the discoverer of this fish, which, if he is not, he certainly is entitled to the credit of introducing it to the attention of sportsmen and naturalists, and pressing it upon their notice until its identity was established beyond question or cavil. He has also urged upon the legislature of Michigan, at considerable expense of time, at least, its protection during the spawning season, and his name has always been associated with it. More than this, he has endeavored during the past year to enlist the sympathy of fish culturists in respect to this noble fish, appealing first to the commissioners of Michigan, and then to those of other States; and failing with these, from one cause or another, he next tried private persons engaged in fish breeding, and finally succeeded in interesting our energetic friend, Mr. Mather, thoroughly in the subject. Mr.

Sporting News from Abroad.

THE fact of hydrophobia being on the increase in England has been already commented upon by us. The case of the death of Mrs. Noyes in New York has been extensively quoted in England, and has somewhat added to the excitement. Our English friends are, however, always very properly methodical in the management of such serious matters, and no doubt the prevalence of rabies in England will lead to a very thorough examination of the disease. Within the last four months rabies have appeared in Cheshire, Yorkshire, Staffordshire, Middlesex, and other counties. We notice particularly the case of Earl Fitzwilliams' hounds, almost the whole of his pack of young hounds having been killed, as they were tainted with rabies. The malady does not seem to have yet shown itself in London, or in any of the large cities. In the country, quite stringent measures have been adopted. We notice in conjunction with the many remedies now proposed for the cure of hydrophobia one emanating from a French authority, which is said to have acted in a most wonderful way. A physician attending a patient who had been bitten by a mad dog, was accidentally inoculated with the virus. Thinking he was sure to die, the French doctor feeling some of the symptoms of the horrid madness, determined to kill himself, and so made up his mind to smother himself in a Russian bath. The result was that his health was restored. We only reproduce the story for what it is worth, without placing any great reliance in it. We deem the fact, however, as worthy of careful investigation, and we trust later to be more fully informed in regard to it.

—We are all more or less familiar with histrionic dogs. There is your star dog, who plays the leading part in the dog of Montargis, and the Newfoundland, who madly plunges from off a pasteboard bridge into a canvas ocean, and draws out the drowning child, who is wet with real water. We have sometimes thought that if Rip Van Winkle could only bring Schneider on the stage, and get him as fat as Falstaff in the first act, and as lean as the apothecary in the last act, such a dog would add immensely to the attractions of the local drama. Our French friends are exceedingly realistic in their ideas of scenic development. There is now being performed at one of the Parisian theatres a piece entitled, *La jeunesse de Louis XIV.* There is a grand hunting scene in it, and a whole pack of hounds are introduced. To the sound of trumpets blown by the huntsmen, the dogs yelp in unison. But there is a fact combined with dog nature which no amount of training will overcome. Instead of holding their tails, like plumes, straight up in the air, the acting dogs will drop them, and carry them in a distressed way between their legs. Some cruel essayist on the subject of "training dogs for the highest walks of the drama," has proposed to nick the dog tails. But all ideas of taking the wag out of a dog's tail is very properly met with the scorn it merits. These French dogs, it seems, show little life on the stage, and like some unfortunate ballerines, have a disposition to singe themselves in the blaze of the foot lights.

—Societies for the prevention of cruelty to animals are fast increasing in numbers. During the last fourteen months in England there have been 2,980 convictions. In England, Scotland and Wales there are fifty-three societies; in Ireland seven; seventy in Germany, Austria, Russia, Italy, the Netherlands and Switzerland, and four in France. Spain is singular by being the exception, which is a reproach to modern civilization. Her protest against general humanity, is thrown out by her unceasing adhesion to bull-fights.

—Human endurance necessarily gets to loathe that constant quotation of "how to teach the young idea how to shoot," but we are forced to give it once more to our readers, as very fitting for a novel movement in France. We have already asserted, and in a pretty positive way, that Americans were more familiar with the use of firearms than any other people, and we stated generally the reasons for it. In France, the knowledge of how to use firearms is rare, save among the richer and more privileged classes. Now it has struck the French school authorities; probably it was derived in some way from the Minister of Public Instruction, or most certainly had his assent, that if the boys going to school in France knew how to strike a bull's-eye with a rifle ball at a fair distance, when the time should come, when the threatened cloud should burst, and France and Germany would again be pitted against each other, the schoolboys of the present time might, in ten years to come, have a chance of picking off or potting some Prussian. We notice, then, in our French contemporary, quite an important notice given of the rifle shooting of the pupils in some of the leading Parisian schools. The Minister of War, General du Barail, presented a rifle of honor to the best shot among the collegiates, and the Minister of Public Instruction gave silver medals. We should be glad if *La Chasse Illustrée* would give us the distance shot at, size of target, and fuller particulars. Under careful supervision, exactly such contests might be introduced in some of our own public institutions, and the school of Creedmoor might be commenced at an early age.

—*Land and Water* gives, through a correspondent, notice of the sale of a large consignment of prairie chickens in Liverpool on or about March the 27th or 28th. The birds sold for 3s. 6d. to 4s. 6d. a brace. About 8,000 birds were disposed of, and went off like hot cakes. We beg to remark, though we may not be absolutely certain about it, that it looks very much as if these birds were killed in the United States during the close season, and we would

particularly direct the attention of our New York Society for the Protection of Game to the fact. On the 1st of March the close season for pinnated grouse commences in the United States. Dealers who had these birds in New York, finding no sale for them, have very probably shipped the prairie chickens during the first or second week of March, and they would arrive in England just about the time indicated by the *Land and Water* correspondent. An example or so made of those game dealers shipping these birds, or having them on hand after March 1st (for it seems to us highly probable, from the date of their being sold in Liverpool, that they must have been, as we said before, shipped from the United States some time after March 1st) would impart a useful and salutary lesson. Of course our English friends can know nothing about our game laws, and are not responsible for any infringements of them, but we feel sure they will give us their hearty approval for our efforts in upholding our own enactments in regard to the close seasons.

—Accidents in the hunting fields do come after all. It is strange how, regardless of laws governing the probability of chances, misfortunes will occur one after another. One steamship belonging to a particular line came to grief, and in rapid succession two or three more belonging to the same company met the same fate. In England, last week, Lord Rossmore and the Baron de Krause died of injuries received in the hunting field.

The Kennel.

LAVERACK SETTERS.—We notice with great satisfaction the efforts now being made to import true breeds of dogs into the United States. Most especially do we congratulate ourselves that the idea of making field trials, as the only method by which gentlemen can judge of the excellence of their animals, has taken such fast hold.

We are importing from Mr. Edward Laverack of England, for C. H. Raymond Esq., of Morristown, New Jersey, two celebrated dogs, which Mr. Laverack is willing to dispose of. One is a lemon and white bitch, two years old, hunted over one season in Scotland. Price £100 sterling, the other is a five year old dog, who has been hunted four seasons. His price was £30 sterling. The first animal is we believe, with one single exception the highest priced dog ever imported into the United States. Both of these setters are nearly related to all the Laverack field trial and prize dogs.

We have not the least doubt that before very long our kennel will be represented by the finest dogs that can be had in England, and that in a few years their issue will entirely revolutionize the race of setters and pointers in the United States. We have casually mentioned the Laverack dogs, as now having been ordered through our intermediary, though we have sent for a great many other animals from Mr. Macdonna's kennel, and from other leading gentlemen's establishments in England, in fact we think for first class animals our demand is somewhat in excess of the supply.

We would most particularly call the attention of our numerous friends to this fact. We do not sell dogs or guns, we simply place our American gentlemen in correspondence with leading breeders of dogs and manufacturers of arms in England, and their orders pass through our hands *free of charge*. We believe it would be entirely foreign to the province of the paper we have the honor of conducting, did we manage this particular business in any other way. If we desired to do otherwise, we could easily have remunerative business flowing through our hands, which we deem, however, not legitimate. We have therefore laid it down as an inflexible rule, that no commission either from buyer or seller can be received by us. In this way our skirts must remain perfectly clean, and we will be enabled to better appreciate the rights of all parties concerned. Of course our personal attention to these matters, entails no small amount of care and trouble. Our reward will be the perfect confidence which must be engendered between us and our numerous friends. This confidence in its fullest sense we are already appreciating. This is the only *quid pro quo* a newspaper should care for. We consider we fulfill our mission perfectly by giving our readers through the *FOREST AND STREAM*, the results of our long experience.

ON KENNELING AND FEEDING DOGS

NUMBER TWO.

THE former portion of this very interesting letter by a sportsman signing himself "Old Calabar" in *Bell's Life*, appeared in our journal last week, the remainder next issue:

"If you wish to make a first rate yard it should have iron railings, about eight feet high all round, but if you do not wish to go to that expense, split fir poles will do, or stout galvanised netting, if you have iron rails and set on a wall, that wall should not be more than two feet high, but I prefer having no wall at all to the exercise yard. It is a good plan in summer to have a covered bench placed in the middle or on one side of the exercise yard, so constructed that the sun cannot get to the animals. This should be made to take to pieces, so that you can remove it in winter time. I forgot to mention that the tray or bench in the sleeping house ought to have a flap or bars in front to prevent the dogs creeping under, which they will do when tired. Nothing can be worse for dogs than lying on cold bricks after a hard day's work—it brings on rheumatism, paralysis, kennel lameness, and a host of other diseases that dog flesh is heir to. The feeding and water troughs of iron or ware, the latter are the best because they are more easily kept clean,

Mather therefore made arrangements to go to Michigan to procure spawn and grown fish for experiments in propagation at his breeding establishment at Honeoye Falls, New York, and investigations were begun early in March to ascertain the time of spawning. Mr. Fitzhugh made a reconnaissance and caught six fish with ova far from maturity. It was then argued, upon analogy, that gravid fish would not be so apt to be caught as those less advanced, and that the majority might be near spawning after all; and so on the 25th of March Mr. Mather started on the expedition, and the result is told in the very important letter which we publish to-day in our department of "Fish Culture." It is to be hoped that earnest hopes will be realized, and that this fish may be introduced to this and other States, and that it will thrive, and henceforward afford abundant amusement to the angler, who will greatly rejoice at this valuable addition to the somewhat limited number of our game fish.

MASSACHUSETTS ANGLER'S ASSOCIATION.—A meeting of this association was held in Codman Hall, Boston, on Friday evening, 17th instant, President Ordway in the chair. After the preliminary business had been transacted, Walter Brackett, Esq., of the Advisory Board, reported the action of said board in regard to the illegal taking of smelt, as reported at the last meeting, and that they had given notice to the chief constable of the State, and received the assurance that everything should be done to prevent further seining in the places where it is reported as having taken place. They also recommend that the smelt and lobster laws, passed this year, be printed and copies distributed throughout the State where the law is most likely to be disregarded, with the endorsement of the Association, and the following notice appended:—"The executive committee of the Massachusetts Angler's Association hereby give notice that the provisions of the above law will be strictly enforced, and any person giving information of the violation of the law will confer a favor by addressing C. Warren Gordon, 47 Bromfield street, Boston. All communications will be strictly confidential." The report was accepted. The chief constable has caused these notices to be posted in all towns interested, and instructed his subordinates to faithfully enforce their provisions. Fish dealers in the Boston markets were given, at their request, until the Tuesday following to close their stocks.

Mr. Brackett called the attention of the members to the recent meetings of the fish and game protective associations in New York, and said that it was desirable to have the co-operation of the Angler's Association to fix upon a plan of co-operative game and fish laws.

Baylies Sandford, Esq., reported that the city marshal of Fall River had given notice that persons were unlawfully taking bass from ponds in that vicinity, and had requested information as to the laws affecting the same, which had been forwarded him.

The Advisory Board were empowered to procure suitable rooms for the association.

A PRESENTATION.—On Thursday last, April 16th, the Gatling gun was presented to the Seventy-ninth Regiment, which most handsome trophy was won by them at Creedmoor last October. At 5 o'clock the regiment, under command of Major Laing, marched in front of the City Hall, New York, and in presence of the Mayor, had the Mitrailleur handed over to them. The gun was drawn by two fine horses and a team of Shetland ponies. The successful team of the Seventy-ninth was composed of the following members:—Capt. Joseph Ross, Capt. W. C. Clark, Sergt. Cameron, Sergt. Molloy, Privates Robertson, Edington, Keller, Dake, Ralson, Stephenson, Pyle, and Moore. The score made was 199. The Twenty-second Regiment made the next best score, 184.

FUTURE OPENING OF THE CREEDMOOR RANGE.—We are pleased to announce that by the 1st of May the range at Creedmoor will be in order for rifle practice. We have no time to spare, and the range committee have done well in getting their grounds in order. We are in receipt of the following from Colonel Henry A. Gildersleeve, the secretary of the National Rifle Association:—

OFFICE OF THE NATIONAL RIFLE ASSOCIATION,
93 Nassau street, New York, April 17, 1874.
The range committee of the National Rifle Association announce that the range at Creedmoor is being rapidly put in condition, and will be open for practice on May 1st, when targets numbered from 10 to 20 will be ready for use.

—We would call particular attention to the series of articles entitled "How to Shoot at long Range," published in *FOREST AND STREAM*. In our issue of to-day the fifth paper appears. The method proposed by our able correspondent, T. C. C., of dividing the target into squares, seems to us to be perfectly practical. It will be noticed that T. C. C. thinks our chances in the coming international match will be somewhat improved by the fact that the condition of our atmosphere—its peculiar clearness—may throw our Irish friends out of gear. The Irish eight, we believe, however, will make good use of the two days' practice allowed them, and will be doubtless wise enough to accommodate their sights for the differences of light.

—Our Philadelphia correspondent, O., who writes so intelligently about cricket, may be considered as authority in regard to this noble game. Cricket has undoubtedly taken stronger root in Philadelphia than any other city in the Union. The article by O. will be found to embody the philosophy of cricket, and we believe will do much to engender a proper taste for this most manly of all rational pastimes.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

CANOEING.

NUMBER FOUR.

MENTION of the scale upon which the drawings of a canoe, in a late number of this paper, was constructed, was omitted by mistake; but owing to the fact that the wood cuts were not absolutely accurate and were so small that the slightest deviation would result in a mistake of some magnitude when enlarged to the size of a canoe, this is of little importance. We trust they will convey a general impression as to the shape and appearance of the boat, and be of service in locating the well or cock-pit, the bulk-heads and the hatches. The scale used was one-eighth of an inch to the foot, and may be relied upon in the sail-drawing, which will render it unnecessary for us to give in preet the various dimensions of the sails constituting the rig we have advised.

The lengths of the spars may also be determined from the same drawing, always leaving sufficient margin for them to be rebent when by use they have been entirely stretched. Pine or spruce makes an exceedingly good lower mast for the main sail. Ash answers well for the dandy mast and top mast, and spruce for booms, gaffs and spurs, we think is unsurpassed.

The gunter is difficult to describe. It consists of two light gun-metal or brass castings of nearly the same shape as the caps at the mast heads of our ordinary sloops or schooners. These are secured together by a light metal rod on either side, braised on the castings, of such a length as will make the measurement from the top to the bottom of this gearing eight inches, the proper distance. The gunter should of course be as light as is consistent with strength, and distance of three eighths of an inch should be left between the holes for the masts in each casting, which will permit the standing part of the mast rope to be spliced in around the upper one and will keep the masts sufficiently apart to prevent the rope jamming in hoisting or lowering away, besides giving it a fair lead from the centre of the gunter. The top mast sets up abaft the lower mast and may be fidded with a piece of heavy wire or have a shoulder eight inches from the heel, which will rest upon the upper part of the gunter and prevent its slipping through. Very frequently the holes in the after side of the gunter are made square, and in these cases the tube for the dandy mast is also made square of the same size, upon the theory that when short sail is desirable, the gunter may be lowered down to the deck, the top mast unshipped and replaced by the dandy mast with its sail. This can be done, no matter what may be the size or shape of the after holes in the gunter or the size or shape of the tube for the dandy mast, provided they are alike, but we would suggest that two reefs will be found preferable to this proceeding, the only disadvantages connected with reefing, viz., the weight and length of the boom, being much more than counterbalanced by the difficulty in disconnecting the main sail from the lower mast, making up and stowing the sail. All that is necessary to say concerning the size of the large holes in the gunter is, that they should be just enough larger than the lower mast to permit the gearing to travel freely when desired. It will be found a good plan to have a sheave near the mast head and one just above the deck, connected on the forward side by a groove sufficiently deep to receive the mast rope or halliard, the standing part of which will be secured as we stated, to the gunter; then the rope should be led up between the masts, rove from aft forward through the upper sheave, down the groove on the forward side of the mast and through the lower sheave from forward aft. The gunter will travel *outside* the mast rope. An objection to this plan is that the cutting out of so much wood for reception of the sheaves weakens the mast to an objectionable extent, especially at the lower sheave where the leverage is very great. Our opinion is, that if the mast be made of clear grained pine and one and three quarters inches in diameter, it will stand the pressure of sail in a breeze as long as the canoeist will, perhaps longer, if his judgment is not be relied upon. At the bottom of the gunter should be secured a becket for the heel of the spreet. So in lowering away, to reef the whole head of your sail comes down standing, and on the boom at the proper positions should be lashed small metal hooks in which can be fastened the grommets worked into the reef cringles, mentioned in our last article. The hooks on the boom should be so attached that they will have some play, for the flapping of the sail has more force than one would imagine. The old-fashioned jaws for the boom seem to answer the purpose as well as any metal goose neck we have seen tried.

The main sheet for so small a sail as our canoe's main sail will of course be a single rope, but a very good plan is to have a thimble spliced in the end working on a rope traveler of about two feet in length on the boom, which divides the strain upon that spar and prevents its bending or "buckling," as it is called, and spilling the wind out of the sail. The brails may be rove in this way. Clove hitch the mid-

these are made very heavy, so that a dog cannot overturn them, and they are glazed in the inside; if of iron, they should be enamelled inside; they must be kept thoroughly clean and sweet. Wheaten straw is by far the best for their bed, but sometimes when I have been hard pressed for straw I have used dried fern, shavings, or sawdust, but this latter you cannot use on benches made as I have described. Barley straw brings on mange. The sleeping house must be well ventilated, the ventilators of which should close or open as you may wish. Light ought to be let in from the roof of the sleeping apartment, so that when the door is closed they are not in utter darkness; dogs require light as well as horses or other animals. All shooting dogs ought never be chained up, but have as much liberty as possible. Two hours' exercise each day is not a bit too much for them, the more they have the harder, and in better wind they will be. Unless a dog has regular exercise he is not fit to go for an hour, and is as soft as pap. The kennel must be thoroughly washed out every morning, the beds shaken up, and renewed every few days, or as often as may be necessary. Many dogs are very dirty in their habits, and when this is the case of course they want to be renewed oftener, and especially in wet weather. I now come to that all-important point, feeding. Many do not know how to feed a dog, and though the animal may have lots of food, he never looks well in his coat, because he is not judiciously fed. Whatever you give him let it be at a stated hour, say 2 o'clock, which is a good feeding time. Of course in shooting season you cannot do this, and must be governed by circumstances. I will commence with puppies first. Directly puppies are weaned they must be placed by themselves, with plenty of air and room, otherwise they will be stunted in their growth, grow crooked, and become foundered. They cannot be kept too well (that is in reason), as long as you give them the proper kind of food, which, when very young, should be good sweet milk, thickened with a little flour boiled in it, and given cold. They should be fed at least four times a day till three or four months old, little and often, that is if you wish fine large dogs, then twice a day, till they have attained their full growth, after which once a day is sufficient. Puppies should never have meat of any kind, but plenty of well boiled oatmeal. As they get older this may be flavored with paunch, or something of that sort, and some bony matter must be given to produce lime. Puppies, though they require to be kept very well, must not be allowed to get too heavy, or they will grow crooked in their fore legs, and their knees will go. Your oatmeal, whether the puppies or grown up dogs, must be well boiled, keeping it stirred all the time, otherwise it will turn, and be rendered unpalatable. For grown up dogs make them good porridge of oatmeal, flavored with paunch; a dog in hard work requires a little meat, this must be well cooked."

—A correspondent, C. E. C., from Maryland, asks us the following questions:—

Please inform me why in your paper of the 9th ulto. in giving the points for pointers, you do not allow them any points for retrieving? Do not pointers make as good retrievers as setters? Where a person owns only one dog whether pointer or setter, is it not best for him to be a retriever? I have a very fine pointer pup eight months old that promises to excel as a retriever, and would like to know the objections if any to pointers being taught to retrieve..

ANS.—Pointers as a general rule are or ought to be used for open field shooting only, as their delicate organization, thin skin, slight coat, and having no hair between their toes, prevents them retrieving successfully through scrub oaks, thick cover, swamps and water. Nine times out of ten a shooter will tell his pointer to charge after he has just fetched a snipe or cock out of a heavy watery swamp; the dog having comparatively little clothing will take cold. It is true that a high blooded pointer will go any where, but not without ill effects to his person, such as drawing blood and otherwise materially injuring his physique. We think it is quite sufficient for the pointer to stand his dead bird. We do not see any positive objection to teaching your pointer pup to retrieve, providing he shows the strong instinct in that direction you speak of, although the best authorities state that it injures the nose or scent of any high bred dog to teach him to retrieve. Pointers do not make as good retrievers as setters for the reasons stated above, and moreover if most of the celebrated retrieving pointers if traced back one or two generations it will very likely be found that the grand dam or grand sire was a setter, which will account for this inherent retrieving propensity.

—In a letter just received by us from G. Macdona, Esq., he state that his relative "the Rev. J. C. Macdona desires me to thank you for all your kindness, which he duly appreciates, and he hopes some fine day to accept some of the almost countless numbers of invitations from the gentlemen of America to accept their hospitality." He says, "I am the owner of this valuable kennel, and am proud to say I have sent and am sending to young America, some of the purest and best prize blood of dogs in England, so that I suppose in due time "the daughters will whip the mothers," in this as in other matters." He also states "that when I see the rector the other part of your letter shall be attended to." This latter sentence refers to his final determination as to whether he will bring over his dogs to America.

THE POINTER'S HEAD.

EDITOR FOREST AND STREAM:—

Your correspondent at page 321 would not have needed to ask the question he did if he had a little more knowledge of anatomy. It is the peculiar form of head (brain) that gives a dog his merits. The pointer has large development between and in front of the eyes, down on the nose. Inside of the skull we find the olfactory bulbs largely developed. Such a dog is easily trained. In the common dog these bulbs can be developed somewhat, but never to the extent we find them in the pointer or setter, that looks with its nose. J. C. D., M. D.

—Several prominent gentlemen of Illinois have called a State convention of fish culturists to meet at Elgin on the 5th of May.

dle of the piece of rope set aside for this purpose around the boom about one-third of its length from the clew of the sail; reeve an end from aft forward on either side through small blocks at the lower mast head; bring the ends down and knot under the boom a couple of feet forward from your standing part; these knotted ends are the hauling part and will, if hauled fair, brail up each side of the sail alike; in addition these brails, when hanging under the boom, as we have suggested, make excellent "lazy jacks" and hold the slack sail in reefing.

The jib may be set by having an out haul, which reeves through the stem post or a small block lashed to it, and a halliard which reeves through a block at lower mast head. It is impossible to have the jib halliard block at the top-mast head, although the jib would be greatly enlarged by so doing; for owing to the movable nature of the top mast, one reef would put the jib in the water. The jib sheets are single and it is well to knot the ends of the two together to prevent their getting adrift. As the jib has a boom, one sheet might be made to answer, but it will be found very convenient to have two, in order to catch your jib to windward in putting the canoe about.

The dandy now only remains to be described. With a rope span on the gaff a single halliard will be found to answer. A small block at the mast head is in this case better than a sheave, and if the end of this halliard is fastened to the throat of the gaff the slack rope will be taken up when the sail is twisted, and there will always be an excellent down haul in case the gaff is ever given to obstinacy when it is desirable to have it come down. No brails are necessary for this sail, but a pair of lazy jacks will hold the slack when lowered away. The dandy sheet reeves through a block lashed to the stern post or through a hole in the stern post itself. We must add that the credit of adapting the spreet sail to the gunter is due to Mr. W. Baden Powell.

CANOE CRUISING.

HALIEAX, N. S., April 2, 1874.

EDITOR FOREST AND STREAM:—

Since Mr. Macgregor published his little book, "A Thousand miles in the Rob Roy," this subject has attracted a good deal of attention amongst boating men in Great Britain and other parts of the world where Englishmen happen to have their abode. Canoe clubs have been established, and a great deal of ill-directed ingenuity has been devoted to inventing gimcracks connected with these little craft, in the vain endeavor to make a boat about half the size of a skiff, possess all the requisites of a well-appointed yacht, sailing power, sleeping accommodations, cooking arrangements, &c., &c. The man who expects all this will certainly be disappointed. Canoe cruising is undoubtedly hard work, and any one who is fond of creature comforts, and not prepared to rough it, had better let it alone. On the other hand, there is a sense of "glorious independence" about it; river and lake scenery can be seen to great advantage, it is a healthy and invigorating exercise, and a man of observation will find much to interest him in paddling down a river; good fishing can also often be procured, especially in this country, and a rod and tackle are no encumbrance in a canoe.

It is with a view to cruising on inland waters, therefore, that a canoe should especially be designed; and I may say, as the result of some years experience, that the paddle is the best and most convenient means of propulsion. A sail is useful as an adjunct; it is pleasant for instance when a fair wind springs up, to be able to set sail and run merrily before it, leaning back on the cushions, instead of having the mechanical grind of striking the water with the paddle, first on one side, then on the other; but a fair wind cannot always be ensured, and the attempt to utilize a foul one by beating to windward against it, may perhaps be interesting and amusing to any one who has a pet gimcrack that he has spent a good deal of money and thought upon; but the probability is that, with the current in his favor, which is likely to be the case, if he hauled down his sails and allowed his boat to drift, he would save himself a great deal of trouble and get on very nearly as fast. If a man wishes to have a sailing boat which he can handle easily himself, take a short cruise along the coast, up harbors, &c., &c., he had better order a stout wholesome boat, 15 feet or so in length, 5 feet 6 inches beam, with a fair amount of depth, and with either a small fixed keel or centre-board, as his tastes incline. He will find this a much more comfortable and useful craft than a damp, cramped, nondescript machine, which is not adapted for sailing, and which has too much complicated gear to make a good cruising canoe.

A few remarks on some of the different types of civilized canoes that have been invented may be interesting.

First, the "Rob Roy" class. These canoes have been so often and fully described that particulars of their length, breadth, depth, &c., would be superfluous. They are short, handy canoes, and are probably more used for cruising than any other. The improved Rob Roy, with rounded deck, water-tight compartment at each end, locker for provisions at the side, a small standing lug or latteen sail, an eight-foot paddle with oval blades, is a very good craft indeed. For cruising in America, however, where camping gear must sometimes be carried, the "Rob Roy" is rather small, and is somewhat slow to paddle against stream or in a seaway.

Second, the Nautilus type. This appears to be the favorite class of canoes in America. The original "Nautilus" was designed by Mr. Baden Powell, and was supposed to be an improvement on the Rob Roy. A canoe of this class is shorter, rather wider, and deeper than the latter. She has a good deal of "sheer," and is a very pretty little boat to look at. Taking her beam, which is only about 28 inches, into consideration, she carries a large spread of canvas, and is usually "dandy rigged" with a small foresail, or jib, sliding spreet mainsail, and leg of mutton jigger; all her sail is inboard. The inventor designed her for a "sailing canoe" especially. To a certain extent she fulfills this condition, and is the best of the kind known—that is, she will run and reach fairly, go about, generally without the aid of a paddle, and sail close hauled without upsetting in a moderate breeze; nevertheless, Mr. Powell, in sailing a match at Portsmouth with a canoe called the "Wide

Awake," took the precaution of putting on a life belt when he had to make a tack to windward, and I believe in a regular sailing match she would be nowhere alongside a small cat-rigged centre-board, or boat of the kind I mentioned before.

In my opinion these canoes are very indifferent craft for cruising in. The objections to them are that they are too heavy. This defect might, perhaps, be remedied by using white cedar or pine in their construction, instead of having the planking entirely of oak. They are slow with the paddle; the amount of sails, sailing gear, rudder, steering rod, &c., is out of proportion to the advantage to be derived from it. Last, and most fatal defect, they draw too much water, for the great advantage of a canoe is, that it can be used to explore rivers and in places inaccessible to ordinary boats.

Third, the Ringleader class. These canoes are run 17 to 18 feet in length, 2 feet in width, and 8 or 10 inches in depth. They are generally built of pine or cedar. The original "Ringleader" was built of Spanish cedar and weighed only 40 pounds as she left the builder's yard. They are fast to paddle, and with the wind abaft the beam will sail very well; altogether a canoe of this kind, with more sheer and "camber" than is usually given to them, is about the best for cruising in that has yet been invented. Other inventions, such as water velocipedes, tubular canoes, canoes with centre-boards forward and abaft the cockpit, have been tried, but they are beneath notice as cruising craft, and can only be looked on as playthings. In another article I will send a description of my own canoe, which is rather different from any of the foregoing, and show her merits and defects. C. M. D.

BOSTON YACHT CLUB.—A special meeting was held in Boston on Wednesday evening, 15th inst., at which fourteen new members were admitted, making a total of 263 members. A communication was received from the Dorchester Yacht Club, inviting the club to participate in their regatta on the 15th prox., to be sailed from off the new club house of the Boston's at City Point. The invitation was accepted, and a committee appointed to confer with the Dorchester Club and make all necessary arrangements.

SOUTH BOSTON YACHT CLUB.—The Regatta Committee of this club have decided to have a club regatta at an early day in the season, to be followed by a series of championship regattas, best two in three races, and in the latter part of the season to give a Union Regatta, open to the yachts of all clubs. The yachts have been divided into four classes: First class, keel 25 feet and over; second class, all under 25 feet; first class, C. B. all over 20 feet; second class, 20 feet and under. The days on which these regattas are to be given, or the prizes to be competed for, remain to be determined.

—The second match between George Brown and Robert Fulton has been definitely arranged to take place on Bedford Basin, Halifax, N. S., on Monday, the 22d June, which will be a public holiday. Brown is about to go into training.

—The schooner yacht "Mist," Capt. A. M. Robinson, of Boston, on a pleasure trip to St. John's River, Florida, arrived at Beaufort, N. C. Owing to the lateness of the season, the "Mist" will return north from that port.

—The boat race for the championship of America is, we believe, about to be decided. George Brown, of Halifax, and William Scharff, of Pittsburgh, are to row a five-mile race two miles and a half with a turn, in shell boats, for \$4,000 and the championship. The necessary deposits having been made, the race will take place in Springfield, Mass. in June. William Scharff has defeated Butler, of Boston, John Bigler, of this city, and, we predict, is the coming oarsman of the day.

—The following yachts were launched at City Point, South Boston, last week: Mr. Arthur Cheney's steam yacht "Anemone;" the schooner yacht "Curlew," belonging to Commodore Dean *et al*, and Mr. Robert W. Bibben's sloop yacht "Sue Goodwin."

—The schooner yacht Wivern, Capt. Nat. Wales, has been brought up from Beverly to her moorings off the Point, and her owner has already enjoyed several short trips on her.

—Capt. John M. Ward, the popular treasurer of the Boston Theatre, will have his old love, the "Kittie," afloat within the coming month. Already he has in contemplation pleasure trips to St. Johns, Newport, and New York. During the "close" season at the theatre he makes her his home, and is rarely found ashore. His keel schooner yacht, the "Bessie," he has decided to sell. She is thirty feet long, and there is nothing in a yachtman's dictionary but what is to be found aboard of her.

—The sloop yacht "Marquita," of New York, has been purchased by S. P. Dexter, of the Boston Yacht Club. She is thirty-seven feet over all, thirty-two on water line. Mr. Dexter was formerly owner of the "White Wing."

—A meeting of the Dorchester Yacht Club is to be held on the evening of the 24th, to consider a union with the Boston Yacht Club.

—T. P. Curtis, Esq., of the Dorchester Yacht Club, has purchased the C. B. cat-rigged yacht "Peerless," built and formerly owned by R. W. Bibber, Esq., of South Boston.

—Mr. H. T. Livingston's able little schooner, the "Gypsy" is on the ways at Greenpoint, where she will be lengthened about twelve feet amidships. She will also receive her spars and sails, and will be found capable of taking care of herself in a breeze alongside of vessels very much larger than she is.

—Mr. Louis Lorillard's schooner the "Wanderer," is waiting for a purchaser, and will probably remain in her winter quarters at Pelham, where she is at present, unless sold.

SHREWSBURY, April 3, 1874.

EDITOR FOREST AND STREAM:—

Agreeable to promise I send you a description of a Barnegat duck boat, or, as it is called, a sneak box. This boat needs no recommendation. It has stood the test for years. Yours truly, ROBERT B. WHITE.

Length, 12 feet. Width midships, 4 feet; width of stern, 2 feet 9 in. Depth of stern, 7 in. Sprung timbers all of one pattern, 9-16x13-16 in. distance apart, 8 in. deck timbers natural bend, 1 in. x 1/2 in. Cock-pit, inside measurement, length 3 feet 4 in. width at bow and stern, 18 1/2 in. midships, 19 in. Comb, height of inside at bow and stern, 2 1/2 in., midships, 2 in. From bottom of comb to top ceiling, 13 in. Trunk on port side, set slanting to take a 15 in. board trunk placed alongside and abaft of forward corner of comb. Rowlocks, height 6 in. from coaming 2 in. middle of to stern, 4 feet 7 in., made to fold down inboard and to fasten up with a hook. Stool rack runs from rowlocks to stern, notched at ends into fastenings of rowlocks, also notched at corners and hooked together, rest against a cleat on deck outside, and are hooked to the deck inside. In a heavy sea the apron is used. It is held up by a stick from peak to combing. Thus rigged the boat has the reputation of being able to live as long as oars can be pulled. The apron is tacked to the deck about two-thirds its length. The wings are fastened to the top and bottom of the rowlocks. Mast hole 2 1/2 in., 2 in. from coaming. Drop of sides from top of deck, 5 1/2 in., dead rise, 8 in. Over cock-pit a hatch is placed. Everything connected with the boat is placed inside, gunners, often leaving their guns, &c., locking the hatch fast. The boats sail well and covered with sedge are used to shoot from. With the hatch on a person can be protected from rain, and with blankets, can be accommodated with a night's lodging. With this I send a working model: scale 1 inch to the foot. The "Fishing Tourist" I find very interesting. We have no fishing, thanks to our laws that give us no protection from eel and other seines. Our legislators don't take the FOREST AND STREAM. P. S.—Boards for boats, white cedar, 1/2 in thick, deck narrow strips tongued and grooved. R. B. W.

Fig. 4 shows rowlocks.

PORTLAND, Me., April 16, 1874.

EDITOR FOREST AND STREAM:—

The Maine Boating Association held its third annual meeting, at the Preble House, Portland, on Tuesday evening, April 14th. The Bowdoin of Brunswick, and the Orient, Longshore and Emerald Clubs, of Portland, were represented. The following officers were elected for the ensuing year: H. P. Ladd, Oriens, President; E. Gerry, Jr., of the Bowdoin, Vice President; R. H. Parker, of the Emeralds, Secretary; C. M. Henry, Oriens, Treasurer. The meeting then adjourned to May 25, at which time the date of the regattas will be fixed. Altogether too cold for any pulling yet. VIDI.

BOSTON, April, 1874.

EDITOR FOREST AND STREAM:—

I put the Boston Yacht Club at the head of the list given here, because it is the oldest of the seven. It was organized in 1866 and incorporated in 1868. A great many of its present members have been connected with the club since its organization, and are, as a general thing, very enthusiastic.

A new club house has been erected at City Point within the past year, by C. A. Martin, Esq. It is a two-story and a half structure, 70x40, built on piles about 300 feet from the shore, and has a large wharf extending from the house to the shore, at which yachts drawing 12 feet of water can lie at high tide.

The annual meeting for the election of officers takes place this month, but it is probable there will be but little change in the government, which I give below.

The Eastern Club is at the head in point of wealth. Among the boats are Mr. Bennett's Dauntless, Mr. Douglass' Sappho, &c., &c., and there are a dozen or more vessels of over 60 feet in length; in fact all the yachts are large, a necessary requisite of membership in the squadron being a measurement on the water line of at least 19 feet 6 inches. But little has been done, as yet, in regard to the future movements of the club, though it is settled that there will be a regatta in June and another in September, starting from Swampscott.

The Dorchester Club has the largest fleet, numerically, of any in the United States. There are seventy-one yachts and a membership of 140 on the rolls. The present Commodore is an accomplished gentleman, and one who is well fitted for his duties, and the club could not but thrive under his leadership. Commodore Barnard, and others who retire from the management, still hold and feel their interest in the welfare of the club.

The South Boston Club is next to the Boston in seniority of age, and was organized in February, 1868. All the boats will be in the water before April closes, and many of them will doubtless be able to show better records than ever before, as all sorts of improvements and experiments have been tested.

Captain Macomber is fitting out his famous sloop Ripple with heavier spars and new sails, and evidently expects great results. The first regatta will take place early in June, and will be followed by excursions, reviews, &c.

The Bunker Hill Club still holds its own among the yachting fraternity. There are at present about one hundred names on the list, and the club is organized as below.

The Lynn Club, though but four years old, is one of the most prosperous in the State. Nothing is known regarding coming regattas, save that the usual one on the 17th June will take place, and prizes will probably be offered as usual.

The Beverly Club is the junior organization in the State. It was organized in February, 1872, by a party of about twenty young men, who spend their winter in the city and their summers as best pleases them. By the rules of the club boats are divided into three classes—those over 21 in the first class, under 21 and over 17 in the second, and all under 17 in the third. The first four regattas will take place July 1, at Beverly; Saturday, July 25, at Swampscott; Tuesday, August 17, at Nahant, and a grand union regatta at Beverly, August 19. H. D. E.

The officers of the club are as follows: Commodore, John M. Forbes; Vice-Commodore, John Jeffries, Jr.; Rear-Commodore, R. D. Tucker; Secretary, H. B. Jackson; Treasurer, Addison Child; Measurer, F. D. Child; Regatta Committee, John Heard, W. M. Whitney, B. Joy Jeffries, T. D. Boardman and Alfred Winsor, Jr.

The club now numbers 260 members. The yachts added to the fleet since last season are the Enchantress, Vision and Nimbus, and one of the principal alterations now going on is the cutting down of the Brenda's spars four feet.

BLUE WITH A GOLD CASTLE.

—Mr. Thayer's schooner, the "Triton," will appear this season with increased sail area, having received at Mr. Munn's yard new spars of the following dimensions: Main-mast, 65 feet; fore mast, 62 feet; main top mast, 29 feet; fore top mast, 28 feet, and main boom 46 feet.

—Mr. Charles H. Mallory will bring out this season the large sloop built for him last fall at Mystic, Conn. Her dimensions are: Length over all, 72 feet; length in the load water line, 65 feet; beam, 23 feet 9 inches; depth of hold, 6 feet 6 inches. She is a centre board sloop, named the "Fannie," and is on the list of the New York Yacht Club.

—Mr. W. H. Langley, the former owner of the "Addie," is having a centre board schooner built at Fire Island, from model of Philip Ellsworth's. She has been designed solely with reference to speed. Her length over all will be 81 feet. She will have a main mast 70 feet in length, a fore mast 67 feet, main top mast 34 feet, fore top mast 32 feet. Inside she will be handsomely finished, and the space is so divided that she will have four state rooms in addition to the four berths in the main saloon. She will be called the "Comet," and the christening will take place upon the occasion of her launch, which is expected to be about the 15th of May.

—Mr. Whitman, of South Brooklyn, is now building a nice looking centre board sloop of the following dimensions: Length over all, 42 feet; beam, 15 feet, and depth of hold 5 feet. She will have six feet of head room under her trunk cabin. She is divided below into state room, pantry, and cabin, with four berths.

—The crews of the Harlem Rowing Club and Nassau's are working steadily and practicing every Saturday for the six-oared barge race, which will take place about the middle of May. This is expected to be an interesting and close race.

—The Nassau Boat Club, of Harlem, are importing from England a single scull, a pair oar, and a four oar. These boats have been built by Jewett, of Newcastle, expressly for this club, from specifications and drawings furnished by some of the leading members. They are expected to arrive in this city by the next Cunard steamer.

—The schooner yacht "Haze, Centre Board," fifty-nine feet on water line, has been sold by her late owner, Edward D. Peters, Esq., of Boston, to H. A. Motte, of New York city. She is two years old, handsomely furnished, and carries with her a good record, having already won several prizes. She is now at Beverly, Mass., but will soon be taken to her new home.

CHAMPIONSHIP OF THE THAMES.—Joseph H. Sadler, of London, and Robert Bagnall, of Newcastle, rowed a single scull race on the river Thames on April 16th for the championship and £200. The course was the same as the Oxford and Cambridge boat race, from Putney to Mortlake. This was the first championship contest rowed on the Thames within six years. Sadler was the favorite, and won by three lengths.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Salmon, *Salmo Salar*. Salmon trout, *Salmo confinis*.
Trout, *Salmo fontinalis*. Shad, *Alosa*.
Land-locked Salmon, *Salmo gloveri*.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—From every indication, a larger number of persons will go to the woods this summer than ever before. Whatever the cause, whether it be "the inculcation in men and women, by FOREST AND STREAM, of a healthy interest in outdoor recreation," or whether there be a natural growth all over the country of a disposition to seek the wild wood haunts in lieu of the more fashionable and artificial summer resorts, certain it is that advertisements for country board begin to appear in the papers; anglers are already selecting their fishing grounds, and inquiries pour in upon us as to the desirability of this or that locality, the kind of fish to be caught here or there, and the sort of tackle to be used. All the fishing-tackle stores are pressed with orders, and whatever the general disposition to economize, there seems no hesitation to invest liberally in outfits for the lakes and streams. As we have observed, fly-fishing for shad has surely captivated the angling fraternity, and we doubt not that hundreds will essay their first experiment at the falls and rapids of the several rivers where these splendid fish are found. Only last week one of our best rod-makers and heaviest dealers in tackle, Mr. McHarg, of Rome, N. Y., called upon us for patterns for shad-flies, stating it to be his purpose to confer with all who know anything about angling for shad, in order to obtain approved patterns from which to manufacture large lots with which to fill present and anticipated orders. Herewith we print another article on shad fishing containing most valuable information from an old expert whose name is full guaranty for its reliability.

SHAD FLY FISHING.—THE WHY AND WHEREFORE.—The fact that shad naturally do and will rise to the fly having been established beyond all cavil in the minds of anglers who read the FOREST AND STREAM, I propose, Mr. Editor, as a summing up of the subject, to make some slight allusion to those who preceded Mr. Chalmers and Mr. Prime in casting the fly for this, which has added one

more to the list of our game fishes, and to offer some remarks why shad are enticed by this artificial lure, and suggest in what parts of the rivers which they frequent, the angler may hope for success.

Years ago and before Herbert wrote on fish and fishing over the soubriquet of "Frank Forester," shad were said to have been taken with the fly. The writer alluded to mentions them as having been captured in this way—if I remember correctly, for I have not his book at hand—at the falls of the Passaic. We have heard verbally some years back that they had also been taken on the Connecticut, and that the Savannah River had also contributed its mite to this hitherto unheard of sport; and lastly some brother of the angle who did not give his name enclosed to me three or four years ago a slip of a column or so—whether new or old I am unable to say—from the *Spirit of the Times*, describing at length, the success of a shad fly fisher on the Connecticut, saying that there was nothing unnatural in these fish rising to the fly, or difficult in taking them. But to all this hear say and this small amount of printed authority anglers were indifferent or incredulous.

Before our city gas works had entirely expelled the shad from the Schuylkill it was no uncommon thing for bottom fishers to take them occasionally at the ends of the rapids below Fairmount dam, on the ebb tide, with that most unctious of all baits, shad roe, when fishing for perch and cat fish. A friend of the writer, a complete novice in angling, about twenty years ago, went to Fairmount dam, and with the bait first mentioned, captured three before breakfast, and I have no doubt he still thinks that shad roe is the proper, and perhaps only bait for them, as well as for other fish. The water just mentioned up to about twelve years ago had been a convenient and favorite resort of my own for white perch, from the middle of April to the first of June; my bait was invariably small silver minnows, as long as the two lower joints of my little finger, or the eel-fry not larger than a darning needle, that every spring collect at the western corner of the dam, endeavoring to surmount the falls. With both of these baits I have killed in all, some eight or ten shad when fishing for perch. And yet I considered it a chance catch—that it was some momentary freak of the fish that induced it to take hold. I ought to have known better, and to have investigated the matter, as probably Mr. Chalmers did, for I had not unfrequently seen boys standing on the rocks at low tide, where the current swept swiftly past, catch herring with a bit of red flannel on the ends of their hooks.

Sir Humphry Davy in his *Salmonia* has expressed his belief, although nothing is ever found in the stomachs of salmon taken in fresh water, that they rise to the artificial from some recollection of the natural flies they fed on in their state of parrhood. That it is from some remnant of an old instinct that returns to them on revisiting their native rapids in mature salmonhood, I have no doubt. We find the shad and herring also without food in their pouches in fresh water. And it is only in fresh water, and even then only in the fluvial portions of rivers that this instinct or recollection of the food of their infancy, if you may so call it, seems to return to them.

Now it is well known that salmon will not rise to a fly in salt water, or in fresh water tide-ways, or even in the placid still pools above. The shad, also an anadromous fish and only visiting its native stream to reproduce its species, is in all of these particulars analogous to the salmon. The angler therefore who casts his flies from the wharves at Hartford on the Connecticut, or Philadelphia or Burlington, on the Delaware, Alexandria or the Long bridge on the Potomac, will fish in vain. When casting over some of the pools on salmon rivers, one has parr—the young of the salmon—continually jumping at his fly and even at the knots on his casting line; frequently taking, and of course, releasing them. Young shad also feed on flies that hover close to or alight on the surface of the water. I have seen them at evening above Trenton jumping in thousands, their bright sides flitting in the rays of the declining sun. Colin Lyman of the Massachusetts Fish Commission has even detected and named the species of flies he has found in the stomachs of shad-fry, and it is only in such parts of the river where young salmon and shad thus feed, that the old instinct is awakened and the mature salmon and shad rise at the artificial lure of the angler.

Mr. Chalmers, who is without doubt a sagacious as well as an observing and patient angler, tells us that it is at the end of a rapid where it subsides into stiller water, but still with a smart current, that we are to ply our flies; that with the point of the rod we direct and display our whip back and forth across the current, that the flies are taken on the surface or beneath. This is analogous to casting diagonally across a salmon pool, allowing your flies to swing by the force of the current over the lay of the fish, and to the side you are standing on; and this also, as every fly fisher knows is an effectual way of fishing a good wide trout, cast. I hope my brothers of the angle will not be too sanguine as to killing shad on all the rivers this fish frequent. Our streams are so depleted that such hope would be unreasonable, and moreover some of our southern rivers, even at low water, are so dark that it is likely shad may not rise to the fly for a very good reason, which is that they cannot see it; and on all rivers where there is some obstacle to bar their further ascent, or to detain them, the angler may be most hopeful. If I were to fish the Connecticut I would, of course, go to Holyoke. If the Delaware, to Scudder's Falls, eight miles above Trenton, or Wells' Falls a mile or so below Lambertville, or the rapids at Heltzmann's Spring two miles above Easton; if the Potomac, of course, the Little Falls and rapids below.

And now a word or two as to flies. (I have now a page or so of manuscript entitled "This fly or that fly," which I will write out one of these days for FOREST AND STREAM). And I maintain that this or that particular fly for salmon, shad, trout, or grayling, is all particular nonsense. Mr. Prime used flies entirely unlike those tried and recommended by Mr. Chalmers, and with such flies, after having tried many others, was successful. If one fishes at the proper time of day, or all of some such days as Mr. Prime had, of course light tints will be most killing, and darker colors in bright weather, particularly for the morning. I have now in hand six dozen shad flies for parties in Washington, and while adopting the colors of those of Mr. Chalmers, (you would not advise me imitate the general "get up" of them, would you, Mr. Hyde? rather unkempt, ain't they?) I have also tried some as used by Mr. Prime, that is a lemon color, or winged yellow sally with a sprig of wood duck for tail; and the iron blue dun, both tied on No. 8 (O. Shaughnessy) hooks for stretchers, and on No. 9 for droppers.

In conclusion Mr. Editor, I think that I express the sentiment of all the anglers of the country, in saying that we are

under vast obligations to Mr. Chalmers for having demonstrated so plainly that the shad, after all is a game fish, and for his amiable readiness to impart whatever he has learned.

THADDEUS NORRIS.

—There is a great deal of inquiry for black bass, too, and the methods of taking them, more especially with the fly. Trout, for the first time, seem to hold a second place in the popular estimation. If the glory of the "speckled beauties" is not absolutely waning, anglers certainly are in quest of a new sensation. Some, we hear, will go to Michigan for grayling, and from the description of the game qualities of this fish, the incentive to test his mettle is assuredly great. As to salmon, this noblest of all the fish nobility, many professionals of high art are already booked for Canada, New Brunswick, and Cape Breton. A large number of the St. Lawrence tributaries have been leased this year by Americans. In our advertising columns will be found a long list of rivers which are yet open for bids, including some of the most desirable. The scores which we have published in previous numbers of this journal indicate the quality of the sport they afford. There are salmon enough in them to satisfy the desires of the most ambitious. When the season opens, we shall advertise the routes and means of reaching them.

Next summer several anglers will go to the Margaree River, in Cape Breton, a full description of which has been printed in these columns. One New York gentleman, we learn has already sent his camp equipage with a man, two months in advance of the season, to pre-empt the best fishing stand on this river and hold possession in advance of all comers,—for this river is still free. And if any venturesome angler should desire to try the untried streams of far-distant Newfoundland, where fly has never yet trailed, we can promise him the best of sport and direct him where and how to go.

—To those of our readers who are pressing us for instructions in fly-fishing for black bass, we assure them that we will give this subject attention in due season. Meanwhile, we refer them to the voluminous correspondence already printed in these columns. Bass fishing does not strictly commence until 1st June, the laws of different States varying a fortnight or so from that date in defining the close season; although bass-fishing is habitually practised in the Potomac in April, and from April to June, at which time the fish run up the river to spawn. We are not sure but that the 1st of May is about the very best time for bass-fishing in the Potomac, and we shall add the bass to our list of game fish in season in May.

—And now, a word as to fishing tackle in general:—We have already designated what a perfect rod should be. As to reels, there are many varieties, made of nickel, brass, or rubber, some of entirely new designs, and aiming by their construction to obviate serious faults that pertain to the original patterns, now passing into disuse. Strictly speaking, there are but three distinct classes of reels, the salmon reel, holding 200 yards of line, the trout reel, holding twenty-five yards, both of large diameter in proportion to their width, and the trolling reel, that should hold at least fifty yards. The width of the latter is nearly equal to its diameter, say three inches. The salmon reel is about four inches in diameter, and the trout reel two inches. In reels, as in rods, the requisites are strength combined with lightness, and a construction that prevents the line from fouling around the crank when in play. In angling, the reel performs a most important part, and its use and action should be in perfect accord or correspondence with the play of the rod and line. To render or retrieve, rapidly or slowly, according to the exigencies of the case, giving or taking inch by inch of line when the fish has the but, delivering freely when he runs, or gathering in promptly when he makes his rushes toward you, these are the objects of the intelligent angler, and the reel should perform its duty promptly, or else the captive will either shake off the hook or tear it out. To meet these requirements, clicks and multipliers are employed. The click checks the line from rendering too freely, and the multiplier of course gathers in the slack with multiplied speed at each revolution of the crank. Some recent inventions have the click contrived so as to graduate the strain upon the line, checking it almost entirely, or permitting it to run without any check at all; and there are what is known as balance reels; but both are open to objections which need not be explained here. The most serviceable for trout and salmon are the simple click reels. Balance reels are more frequently used for trolling. The reel should be invariably shipped behind where the hand grasps the rod. We prefer the nickel reel, as brass is apt to tarnish; though for salmon the lightness of the rubber reel is a very important desideratum.

The angler, being now prepared with rod, line, and reel, we will presume is ready to rig for fishing. Take your rod from its case, remove the plugs, and put them in your pockets, so as not to lose them. Joint the tip and middle parts first, and then the but. Leave the extra tip in the handle of the gaff or landing net. Slip on your reel, draw the line through the rings and out of the eye at the tip until you have sufficient length to reach the end conveniently with your hand when the rod is in a perpendicular position, bend on your casting line, with its tail fly and bobbars, or drops, already adjusted, reel back until you have taken in the added length of the casting line, hook the tail fly into one of the bars of the reel, and you are ready for an advance to the river side. The casting line should be not less than seven feet in length, nor more than nine, of best selected gut. The tail fly should have simply a loop, and the bobbars gut lengths; that of the top one, or hand fly, somewhat longer than that of the middle fly,

so that when the line is raised, and the rod in motion, both will touch the water gently alike. When you unjoint your rod take hold of the ferrules with your hands as nearly together as possible, and when you draw upon them give the parts a slight turn in opposite directions, and the rod will usually separate without difficulty. Many good rods are wrenched or broken through ignorance in this single particular. Should the ferrules resist all ordinary efforts, heat them gently. The landing net should be deep and baggy. The most convenient are made upon a brass frame with hinges, so as to fold into a very small compass.

Next week we shall give our first lesson in fly-fishing.

—The St. Lawrence River is still frozen solid at Montreal—ice three feet thick, and people are crossing over to St. Lambert, very little snow is left on the ground. River Richilieu, emptying into Lake St. Peter, an expanse of the St. Lawrence River about eighty miles below Montreal, is now free of ice. Lake Champlain is open at Burlington. No snow at St. John, N. B., at Halifax, N. S., or at Toronto. There is snow at Williamstown, Mass.

—Our regular Portland (Maine) correspondent writes: "The first trout of the season were reported as the fruit of a fast day excursion; some forty brook trout by one gentleman, and about twice that number by another. The latter string was taken from a salt water creek, the former from a rocky bottom, spring brook, running through a maple wood lot; brook full of snow water. The streams are in general pretty well clear of snow water; and although the season is very backward, the trout seem to be on hand as early as usual. Our efficient commissioners, Messrs. Stillwell and Stanley, are actively engaged in preparing for the distribution of eggs, and in connection with their efforts, there is little doubt but the protection afforded to the fish themselves by the laws, if properly enforced by the State Sportsmen's Association (as of course they will be), will make Maine what it once was, the 'Angler's Paradise.'"

—The veteran Van Sicklen has made arrangements to supply fishermen who visit Coney Island Creek with some new boats this season.

—Flounder fishing is excellent in Canarsie Bay at present especially on mild warm days.

—The popular caterer and sportsman John I. Snediker, has resigned his restaurant in Montague street, Brooklyn, to Dieter, and last week he removed with his family to his hotel at Coney Island, where he will be happy to see his friends.

—There is quite a scaly kind of warfare now waging in Boston between the fishermen and the wholesale dealers. The latter refuse to purchase fish of skippers, who retail their catch, while the former declare that their fish may be sold to whom they please, and in whatever quantity they wish. Such matters are always unfortunate. Custom has, however, little to do with it; trade regulates such matters, and we have no doubt but that before long the Boston fish war will be satisfactorily arranged.

—The Big Spring's Fishing Club is situated on the western slope of Laurel Hill Mountain, in Westmoreland Co., Penn., and its territory comprises about four hundred and fifteen acres, chiefly woodland, long and well known as the "Big Springs tract." The following are the officers of the Club:—President, Dr. J. A. Phillips; Vice President, B. Biakewell, Jr.; Secretary and Treasurer, John Gay.

—A correspondent writing from Lynchburg, Virginia, says "our State authorities are very indifferent to the inland fishing interests. No fish-ways are required, and trapping, netting, and seining is practiced in most streams. The James River at this point was formerly a good bass and shad stream, but the dams built to supply the canal to Richmond have prevented free passage, and it is now depleted of fish. The head waters are full of trout, and the whole river might afford excellent fishing if properly managed."

POUGHKEEPSIE, N. Y., March 19, 1874.

EDITOR FOREST AND STREAM:—

I have noticed an "Advice to Fishermen" from your correspondent "Fern Fly," advising a walk from Rondout via Balsam Lake and the Beaverkill to Callicoon, on the Erie Railroad. Unquestionably the distance is long enough to be a "healthy walk." This region has been frequented by anglers for many years. Through their persistent efforts and those of the worm fishermen who catch by count, the average size of the trout that still survive in all the streams has been reduced to a few ounces.

In 1869 a few gentlemen purchased a tract of land, including a pond called Sand Pond, three miles from the Beaverkill, and one of the head waters of the Willwemec, organized a club, called the Willwemec Club, under a special act of Legislature, put up a house, re-christened Sand Pond "Lake Willwemec," and now control by ownership and lease Lake Willwemec, Balsam Lake, Thomas Lake, and the Willwemec stream above De Bruce tannery, except at the saw-mills, which part of the stream is protected by others. This organization was formed, not only to have a pleasant place of resort, but for the protection of the fish. They hoped to prevent the destructive fishing and to save a few of the little trout to grow. It may be interesting to know how they have succeeded in their four years' experience.

About the time of the purchase of Lake Willwemec a party of men netted the lake and took out a large number of fish. Since that time there has been no illegal fishing that the club knows of, and no difficulty whatever in protecting the lake, for the reason that a man and family have resided on the premises at all seasons, and also that those living near have respected the ownership. At first considerable opposition was experienced from persons owning lands on the Willwemec stream, to the idea of protecting fish, but at present quite a different feeling exists, and the club have to thank the property owners on the stream for their cordial co-operation. In regard to Balsam Lake, some fishing has been done without the consent of the owners, but even in regard to that the ownership has been recognized, and it will be better protected in the future.

Balsam Lake, at the head of the Beaverkill, and Lake Willwemec are very nearly the same size, and are surrounded by the same forest, but they have marked differences in character that has occasioned a marked difference in the inhabitants. Balsam Lake is pure spring water, some

parts are very deep, but a portion shallow enough to support a vigorous growth of water weeds filled with the larvae of many varieties of flies. It has five spring streams emptying in it, with nice gravelly bottoms, just right for propagation, and the result has been that for long periods of time, during the past, the fish have increased beyond the capacity of the lake to support them, until a habit of growth has been acquired, and now a fish is never caught over four ounces, and fish three inches long are filled with eggs. They are, however, very abundant.

Lake Willwemec has just an opposite character. It has an even depth of not over five feet, and the whole bottom covered with a growth of chara and weeds, that furnish an almost inexhaustible supply of larvae and flies. It has but one stream tumbling in it over the rocks, almost inaccessible to the fish, until the club improved it, and it is fed by stream around the margin and in the bottom. When the lake was first examined the trout spawned along the edge of the lake near the spring holes, without much regard to the character of the bottom, and a very few, by great effort, went up the stream. The result in the past has been that the greater part of the eggs were destroyed, and the young when hatched had no refuge. Of course the natural increase has been very slow, the food abundant in proportion to the number of fish, and the fish very large.

The club, on purchase, at once tried to help the fish. They built a spawning race parallel to the margin of the lake including the best springs; raised the lake to cover them nicely, and have been rewarded by the fish taking possession during the spawning season, and a fine young crop appearing in the spring. They also cleaned out the stream, and the fish used that as well as the race, and from the report of the man in charge, the numbers spawning have largely increased. This is shown also by the fact that the catch of 1872 averaged one pound, the largest being two and one-quarter pounds; but the catch of 1873 averaged less on account of the accession of small fish; very many large ones, however, were caught.

As far as can be learned from observation the trout have increased in weight about a quarter of a pound per year. The fish in the lake live mostly during the summer on the flies, hatched and hatching out of the larvae grown in the lake, and can be taken only with the artificial fly; but it takes a long line and careful fishing to deceive the large ones.

Late in the season numberless brown dragon flies in pairs dip about over the surface of the water, depositing their ova, as their usual flight is ten to twelve inches above the surface, touching only at intervals, and that quickly. The trout need to be active to catch them, and during the appearance of these flies, trout of a pound and over may be seen springing out of the water, several often at the same time in different parts of the lake, and they usually catch the flies. Strange to say, however, the trout are then very difficult to catch with an artificial fly. There are other times when the whole lake will be in commotion from the jumping fish; whether after a particular fly, or only for sport it is difficult to tell, for the same flies will be upon the water when the fish do not jump. During these exhibitions they are not very catchable.

A southern breeze, a dark sky, a shower, or a good ripple, just as everywhere else, brings them up to the angler's invitation.

In conclusion, lest anyone may be misled, it would not be amiss to say that the Willwemec Lake and Stream are reserved for the members of the Club, and that Balsam and Thomas Lakes may be fished only by their consent, obtained by application.

C. VAN BRUNT,
Secretary and Treasurer Willwemec Club.

—Our correspondent at New Smyrna, Florida, sends the following notes:

NEW SMYRNA, E. Florida, April 1, 1874.

EDITOR FOREST AND STREAM:—

Bass or redfish, *Corvina ocellata*, are now plenty, and may be found coming in from the sea at young flood, feeding along the shore in rather shallow water. The fisherman here make the following distinction: They call the fish of 15 pounds and over "channel bass," under that simply "bass." They give good sport on a rod, biting fiercely and fighting strongly; their first nibble is violent and long, but they do not, I think, fight as stubbornly as the striped bass.

Pigfish, *Micropogon undulatus*—Cuvier—I am not certain about the scientific name of this fish. They have made their appearance here this year in great numbers. We get two or three dozen in a tide. It is shaped something like a sheephead, though not quite so deep through weight about one pound, and it is the richest and best flavored fish we have here, next to the pompano. The pigfish takes a mullet bait, on the bottom, and fights strongly when hooked. On a light rod they give fine sport. Color, bluish above, with diagonal lines of yellow, silvery beneath. Whiting, or kingfish of two species, are also abundant, and are highly valued as a table fish. *Umbrina nebulosa*—Storer—and *Umbrina alba*, the latter more numerous, a very handsome, game and delicious fish. As the warm weather comes on we are much annoyed by large cat fish, sharks and rays, the former of which insist on being caught to the exclusion of better fish, and the sharks and rays carry off lines and hooks in abundance.

April 1—Three anglers in the boat, took 4 bass, 20 whiting, 23 pigfish, 18 blackfish or sea bass, 10 scup, 1 flounder in one tide, besides many catfish.

April 2—Three anglers took in one tide, 5 groupers, from 1 lb. to 4 lbs. 2 snappers, 2 lbs. each, 1 bass, 5 lbs., 24 whiting, 27 pigfish, 8 scup, 12 blackfish, 2 sharks. Lost many hooks and one line by sharks. Took 11 species of fish one day and 10 the next.

S. C. C.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

ANNOUNCEMENTS.

Harper & Brothers' recent issue of a very finely illustrated work, under the title of the "Land of the White Elephant," a personal narrative of travel and adventure in farther India and adjacent countries. This work is instructive and very entertaining, a handsome octavo containing sixty illustrations. It comes to us in the usual tasty style of the Messrs. Harpers. We shall notice this valuable work again.

Appleton & Co. have just published Florence Marryatt's last work—"No Intentions"—which has the reputation of being quite equal, if not superior, to "Poison of Asps," and Dr. Edward Smith's new book on "Health." Also a work of great value to students upon the "Expanse of Heaven" by Mr. Proctor. This last work was never before issued in this country.

Carleton & Co. have just published "The Story of a Summer; or, Leaves from Chapaqua." By the niece of Horace Greeley, Cecelia Cleveland. Price \$1.50.

Lee & Shepard have nearly ready a new novel, "The Italian Girl." By Catharine Sedgwick Valerio, who is a niece of Miss C. M. Sedgwick, the author of "Ina." It is the history of the startling life of a young circus rider, her eventful career as a famous actress, marriage, &c.

Dodd & Mead will shortly issue "Gerda; or, The Children of Work," the new novel by Madame Schwartz, of whom our readers need not be told that a most charming story will make their hearts glad. It is said to be a work founded on fact—in a word, a life experience.

Appleton & Co. will soon give to the public, in their accustomed good style, a work bearing the title of "A Daughter of Bohemia." Also Dr. Maudsley's highly important work upon "Responsibility in Mental Disease."

Macmillan & Co., New York, will shortly issue "Cave Hunting," researches on the evidence of caves of the early inhabitants of Europe. By W. Boyd Dawkins, F. R. S. Illustrated. Royal, 8vo.

Macmillan & Co., New York, have nearly ready the "Physiology of the Circulation in Plants in Animals and in Man." By J. Bell Pettigrew. 100 engravings on wood. 8vo.

IN THE DAYS OF MY YOUTH. By Amelia B. Edwards Philadelphia: Porter & Coates.

An autobiography, or the stirring adventures of a young surgeon. Since the great popularity of a work entitled the "Diary of a Physician," we have read no work of the kind that has interested us more than the one before us. The plot of this work is laid in France, and is what may be termed a well written story. The story, though not without some slight imperfections, upon the whole would be called a very clever effort for an author's first attempt.

D. Appleton & Co.'s last work of the "International Scientific Series," is entitled "Animal Locomotion; or Walking, Swimming and Flying." To this is added a dissertation on aeronautics. This last is written by J. Bell Pettigrew, and is alone a valuable addition to this work. This one of the good fruits of our publishers is simple, comprehensive and plainly written, nothing obscure or complex can be found in the whole work. The illustrations, of which there are one hundred, are well calculated to make the subject matter of the text thoroughly and easily understood. We know of no more appropriate work for our young men than this last of the International Series.

FRANK FORESTER'S SHOOTING BOX. T. B. Peterson & Bro. Philadelphia.

This work, perhaps well known to many of our older readers, recalls Frank Forester in his most amusing style. It belongs to that period of our literature when pointers and fair ladies were mixed up according to the guise of the story-teller, and when a hundred or so of woodcocks could be had almost anywhere with the least possible outlay of trouble. An interesting love episode worked into the hunting details of the "Shooting Box" makes the story a capital one, and recalls the happy times of twenty or thirty years ago, which was during the golden age of the American sportsman.

SETTERS AND POINTERS; Their rearing, Training and Hygiene. By Elbert S. Carman. Published for the Ahaodah Society by D. Appleton & Co. New York.

Mr. Carman's book, we feel certain, has done a great deal of good. It inculcates those certain fixed principles of humanity towards dogs which are unfortunately too frequently overlooked, and besides treats of that important subject of breaking a dog, and how best to do it oneself, which latter point, we believe, if more fully carried out, would add immeasurably to the pleasure all sportsmen derive when hunting. It is, then, a most agreeable task to review, even in a rapid way, a work emanating from a gentleman and written for his fellows, which varies in many ways from the cut and dried text of the many authorities, all considered *ex-cathedra* exponents of dog breaking. The basis of the theory of teaching the young pointer or setter his duties, as detailed at length in the book, is founded on that of engendering a feeling of love and obedience between the animal and his master, and of using punishment as rarely as possible, but that when such punishment has to be administered it must be given in a most thorough manner, and a perfect mastery must be gained at that time and forever by the man. The quantity of patience necessary either to teach a child or a dog is called for in inexhaustible quantity, only measured by the peculiar idiosyncrasy of the individual who is to learn. There are good and bad puppies. Some who instantly respond to the call made on their intelligence; others that remain refractory under any amount of punishment. There is your good-natured dog, who takes his hiding with resignation, and will love you after it, and his brother who, when you thrash him for a fault, will hate you from that time on. We are not disposed to give any dog a bad name, but are inclined to side with the optimist about children, who declared that all children were born good, and that there never was a bad child. We think, then, with the author, that the majority of dogs can be better and more easily broken by kind treatment than by the opposite. Mr. Carman expresses it briefly in this sentence: "If we desire companions in our dogs we cannot begin their social education nor engage their affections too early with loving, kindly intercourse. * * * If, however we have no friendship for the dog as an associate and retain him solely as he is serviceable in the field, we do not question but that without any social education he may be broken by sheer brute force." The views, then, of the Ahaodah Society respecting setters and pointers may be regarded as spirited protest against the harsh treatment too much in vogue in breaking dogs, and explains how the individual may, with gentleness and discretion, make his pointer or setter not only an object of pride as to his ability in the field, but how at the same time both man and dog will mutually care for and love one another. Alas! that human nature is so far from perfection, for it seems to us that before breaking either dogs or horses, almost all mankind should themselves first be taught how to keep their tempers and learn what is obedience, before endeavoring to make animals submissive to their will. We cheerfully recommend the book to those who love their four-footed friends, as the author undoubtedly has great experience in the subject he treats, and regards the dog from a much higher standpoint than do most people.

HISTORY OF THE GRANGE MOVEMENT; Or, The Farmers' War against Monopolies. By Edward Winslow Martin. Illustrated with 60 fine engravings, portraits, &c. National Publishing Company, Philadelphia.

From the advance sheets of this work we can safely promise our readers a work of great interest upon the subject of the times. Coming as it does, at a time when "consciences" are almost as plenty as frontier scalps in times of our border wars, and not half as valuable, we think this vigorously written work will have a ready sale, as it will find many readers. The agricultural classes are, we are happy to state, beginning to take a fair estimate of the value of a man of true integrity of character and singleness of purpose. As an honest man he cannot afford to throw away his character. Knowing that monopolies are his enemies, he has at length cast about him, and now dare look full in the face the grimmest of all the old monarch locomotives. In this huge machine he beholds embodied in a single word high rates of freight for his grains and cereals, his corn and his wheat, and he fears if something is not speedily done to arrest the progress of this wide-spreading disease, starvation alone remains for him and his family. Hence, acting upon the great principles of self-preservation, we have, he rises, organization and progress of that formidable party called the Grangers, Patrons of Husbandry, &c., and this is a party that is destined to command the oldest of the "whistlers," the "big buffalo" of locomotion, to stand still while the people argue for a while the question of high and low freights. A full knowledge (starting indeed) will be obtained from this work. We have only time to give this outline at present of a work of intense value to every person, whether he is a western farmer, dealing in cereals, or an eastern shoe manufacturer, selling his home manufactures. Each and all should read this book of the times, for he will, before long, find himself one of the "ins" or "outs" of the Granger policy.

A Popular Key to the Birds, Batrachians and Fishes of the northern United States east of the Mississippi River. By Prof. D. S. Jordan and B. H. Van Vleck. Appletons, Wisconsin.

This little book supplies the want often felt by collectors and naturalists for a convenient pocket key for identifying birds, reptiles, fishes, &c. It is just the handy volume for a field naturalist, with whom usefulness and compactness are great items. The key to reptiles, batrachians and fishes will be found of great value to students, enabling them to identify specimens with great facility, who had not the means of procuring voluminous works of reference.

PRIZE LIST.

FOREST AND STREAM

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.

It is the OFFICIAL ORGAN of the

FISH CULTURISTS' ASSOCIATION
OF AMERICA.

The Publishers of FOREST AND STREAM

In order to stimulate the development of

MANLY and ATHLETIC EXERCISES,

AS OF

FISHING, SHOOTING, ARCHERY, CRICKET, FOOTBALL, and CROQUET,

Offer the following prizes for clubs of three or more

Single Subscription per Annum \$5

Starting Clubs.—Agents, and others interested, are advised that we do not insist upon their starting with full clubs to secure our rates. They can send three or more at a time, and on forwarding the requisite number within 60 days will be entitled to same premiums as if all were sent together.

CRICKET.

For \$20 00 four copies, one year, with one best spring bat, one College bat, one Dark cricket ball; price \$7 50.

For \$25 00, five copies, one year, with a complete cricket set; one College bat, one polished bat, Clapshaw; one Dark cricket ball; one set of stumps; price \$12 00.

FOOTBALL.

For \$15 00, three copies, one year, with one Rugby football; price \$6 00.

FISHING RODS.

For \$15 00, three copies, one year, with one superior four joint light rod, suitable for all kinds of fishing; price \$7 00.

For \$60 00, twelve copies, one year, with one suitable for trout, black bass with fly, or for trolling bass or pickerel; as fine a rod as can be made; German silver tipped, with three tips; price \$25 00.

CROQUET.

For \$20 00, four copies, one year, with very handsome set of croquet; price \$7 00.

For \$25 00, five copies, one year, with superb set of croquet; price \$10 00.

For \$30 00, six copies, one year, with the finest set of croquet made; price \$14 00.

REMINGTON RIFLE AND SHOT GUN.

For \$75 00, fifteen copies, one year, with one Remington Deer rifle; price \$28 00.

For \$100, twenty copies, one year, with one Target rifle, 30-inch octagonal barrel, to be used for sporting, hunting, or target shooting; price \$36 00.

For \$100, twenty copies, one year, with one Remington double barreled, breech-loading shot-gun, one of the best guns ever offered to American sportsmen; price \$45 00.

SHARPE RIFLE.

For \$100, twenty copies, one year, with one Sharpe sporting or target rifle, best quality; price \$40 00.

WARD-BURTON RIFLE.

For \$200, forty copies, one year, with one Ward-Burton rifle magazine gun for large game, price \$0 00.

SINGLE AND DOUBLE BARREL MUZZLE LOADING SHOT GUNS.

For \$20 00, four copies, one year, with one American single barrel gun, perfectly safe, blue barrels, walnut; price \$10 00.

For \$35 00, seven copies, one year, with one American double gun, handy and reliable gun every way; price \$18 00.

For \$50 00, ten copies, one year, with one double boys' fine twist barrel gun, a safe gun every way for boys; price \$26 00.

For \$75 00, fifteen copies, one year, with double gun, English laminated steel barrels, handsome finish; price \$45 00.

CASH PREMIUMS.

To those who prefer cash premiums a discount of 25 per cent. will be made on all clubs of three and upwards.

Every article is of the finest quality and will be sent free of expense.

Remitting Money.—Checks on New York City banks and bankers are best for large sums; make payable to the order of FOREST AND STREAM PUBLISHING COMPANY, 103 FULTON STREET, NEW YORK. Post Office Money Orders for \$50 or less are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.

Send the names with the money as fast as obtained, that subscribers may get the paper at once.

Office, No. 121 Walnut Street,
Philadelphia, Pa.

Miscellaneous.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6½ lbs. each, and in canisters of 1 and 5 lbs.

AUBUBON POWDER,

Very quick. For woodcock and quail Nos. 1 to 4. Packed in metal kegs of 12½ lbs. and 6½ lbs., and in pound canisters.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes. Sizes Fg, Ffg, Fffg, the last being the finest and most used. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6½ lbs., and in canisters of 1 lb. and ½ pound.

All of the above give high velocities and less residuum than any other brands made.

LAFLIN & RAND POWDER CO.,

21 Park Row, N. Y.

(OPPOSITE ASTOR HOUSE.)

HAZARD POWDER CO.,

MANUFACTURERS OF

Sporting, Rifle and Target
GUNPOWDER.

"ELECTRIC," in 1 lb. canisters.

"AMERICAN SPORTING," in 1 lb. cans and 6½ lb. kegs.

"DUCK SHOOTING," No. 1, 2, 3, 4 and 5 grain, in 1 and 5 lb. cans and 6½ lb. kegs.

"KENTUCKY RIFLE," in 1 lb. and 5 lb. canisters.

"KENTUCKY RIFLE," FFFG and FFG and "SEA SHOOTING" FG in kegs of 25, 12½, and 6½ lbs. and canisters of 5 lbs.

Superior Mining and Blasting Powder.

The above well-known Gunpowders are supplied by the company's agents in every prominent city, and in the various mining districts of the United States and by all dealers in Guns and Sporting materials, or wholesale at the office of the Company,

TROUT FISHING IN THE PENNSYLVANIA Mountains good. Send for circular. A. MAGIN. NIS, Forks P. O., Monroe County, Pa. It

THE ELM HOUSE. A PRIVATE SUMMER HOTEL. CHAS. F. ORVIS, Proprietor, Manchester, Vermont. Transient board, \$2.50 per day.

PAMRAPO HAS THE LOVELIEST sites, and the most charming surroundings of any suburb near New York. Situate facing the Bay of New York and the Narrows, the views of marine scenery are absolutely enchanting. Here is ever a changing panorama of passing vessels, life and activity sparkle upon the waters, bay and sky blend the beauty of their gorgeous painting, such as not even an Italian lake scene can surpass.

HEALTH—The death rate is only 12 in 1,000; in New York and Brooklyn nearly treble.

WEALTH—All the principal railroads south and west terminate at Jersey City—the Erie, Penn. Central, Midland, Central New Jersey, the New National, and West Side. Taxes are only half the rate for New York or Brooklyn, and are so low that property will double every few years for twenty years to come. Here is the proof: The rate of increase in New York is less than two per cent.; Brooklyn, nearly five per cent. while the rate of Hudson County is nearly fifteen per cent.

With these advantages, it is only natural that this section should offer the greatest inducements to investors, both large and small. So come and select your sites, and build your house, or buy a house on installments, \$10 monthly, only from desirable parties taken, and after a few hundred dollars are paid lot buyers are loaned money for building purposes. Call on owner, C. E. HOE, 65 Wall, 4 Pine streets, or Pamrapo, N. J., which place is only 23 minutes from foot Liberty street, N. Y.; fare in all but 7 cents commutation.

A SPORTSMAN'S HOME FOR SALE—WITHIN an hour's ride of the City of Philadelphia, an excellent Farm of 164 acres, 2 fine stone dwelling houses, 2 stone barns, with necessary outbuildings. Beautifully situated, and in every particular a very desirable property, especially to those fond of field sports. Ruffed grouse (pheasant), quail, hares, squirrels and foxes abound. A fine stream runs through the property. Price \$8,000. Will be sold on very easy terms. Address XXX, Forest and Stream Office, 103 Fulton street, New York.

Miscellaneous

DR. FOWLER'S PATENT
HARD RUBBER REEL.

"The Gem."

Imperishable, Light as a Feather, and not Liable to Get Out of Order.

Numerous letters of recommendation have been received from the most experienced anglers in America, highly approving of this Reel, prominent among which are Mr. Seth Green and the Hon. Robt. Roosevelt.

This Reel, the latest contribution to the angler's outfit, has now been before the public for one year, and we have yet to hear of the first complaint from the many hundreds who have used it.

For Forest and Stream.

THE SECRET OF SUCCESS IN THE FASCINATING ART OF FISHING.

BY A FISHER.

THERE is a wondrous secret in the gentle art of fishing
My precious fellow lady fishers,
That though your implements exactly meted to your wishing
Should be approved by your best wishers,
As common hook and line would be, and fly with wing unspangled,
Around which and about which all the worthless fish have wrangled,

Despite your tact and all the favor of electric force,
Without this mystic acquisition,
You'd greatly multiply the chances of your own divorce
From piscatory erudition.
Albeit your fish were silver scaled, your fly a real professor,
You'd find yourself of true success at last a non-possessor.

Do you remember that the antique art or trade of fishing
Has honor won in Christian story?
Do you remember, precious lady fishers (without wishing
To derogate from sacred glory),
How chosen fishers were instructed by their Lord and Master?
O, likewise, fish for men yourselves; than fish you'd catch them
faster.

I know quite well the savants of the geologic science
Call fish first lords of the creation;
But why should you with fossils care and seek to make alliance?
Why pet the fable's conservation?
Just fish for men with net and hook, and make quite sure you catch
them,
For there is not a fish on earth that can begin to match them.

And he who of the strata prates, and of the reign of fishes,
Ere earth arose to greet the vision
That overhangs it with its thousand sparkling evening wishes
That it might be a real elysian,
Most surely prates of what he knows far less than what he guesses,
Which is, in sooth, a knowledge here that rarely ever blesses.

Take my advice, and if in future time you go a trolling,
With Grizzly King or a Professor;
Or when along adown the stream of time you are patrolling,
Why troll around to your confessor—
That is, if you have caught a real Omega of creation,
That meets and merits well your love as well as approbation.

But don't forget there is a secret in the art of fishing,
And your success depends upon it;
So do not trust too much to waiting, praying, and to wishing,
Which mean success, but ne'er have won it.
To perseverance in the art the fact there's no denying,
Though genius, fate and Fortunatus are the facts defying.

For Forest and Stream.

Zoology of the Northwestern States and Territories.

THE URSIDÆ.

PERHAPS no portion of the temperate zone is so well fitted for the sustenance of animal life as that which lies between the Rocky Mountains and the Pacific ocean, and which is known in our local parlance as the Pacific slope. This is readily accounted for when we consider the topographical conformation of the region, which embraces broad, rolling, treeless plateaus, deserts clad only with artemisia and greasewood (*Pinus tridentata*), extensive areas covered with dense forests of coniferæ and a shrubbery growing in tropical luxuriance. For birds and quadrupeds which love the rarer atmosphere and high altitudes we have ranges of mountains clad in perennial snow; and for the natatores a web of rivers which traverse the country in every direction, and are stocked with many varieties of fish; and added to these are the varieties of climate peculiar to the region, and their generally mild character, and we have sufficient reasons to account for the abundance of animal life here, and the number of its species, many of which are new to science, and unknown east of the Rocky Mountains.

Mountain ranges have far more effect on animal and vegetable life on the Pacific slope than on the Atlantic, hence the species found on one side of a range are generally strangers to the opposite. The Cascade Range, the most exalted chain traversing the Pacific coast, is far more arbi-

trary in its division of animals than the Rocky Mountains, for species found on the western side of the latter have also their habitat on the eastern, a fact which is seldom the case with the former; thus the zoological fields of the Pacific States are more distinct, geographically, than those of the Atlantic. Our animals of the same species as those of the eastern States are also much larger than their congeners, and we certainly possess the finest sporting birds, fishes, and quadrupeds known to this continent, so that this is the best field for the keen hunter who cares not for toil or danger, or the followers of Cotton and Walton.

With this much for a preface, I shall now give your readers a description of the ursidæ peculiar to this region, they being our highest order of carnivora. Of this family the most common is the black bear (*Ursus Americanus*), which is very abundant in all the wooded portions—more abundant, undoubtedly, than in any other part of the world. In berry season its presence can be detected almost everywhere in the forests by the number of berries it has stripped off the bushes, and the torn condition of the soil in many places where it has been digging for roots. In the summer it is also a frequenter of thickets where a species of buckthorn (*Frangula purshiana*) grows, as it devours the fruit of this tree with great avidity, though to the *genus homo* the fruit proves a most violent cathartic. The animal is but little hunted, notwithstanding its numerical strength, owing undoubtedly to the cheapness of its fur, or else to the difficulty of finding its domicile during the season of hibernation, when its wardrobe is in the best condition for mercantile purposes. The Indians of the northwestern coast who live by the chase—and they are now few in number—devote some attention to the capture of bruin during the latter months of autumn; but while deer remain as abundant as they are at present they will not forsake the latter to go in search of the former, for our *Sivashes* care more for ventral pabulum than the excitement of a run and a combat with the plantigrade. The abundance of the animal may be one cause why it is so little cared for, even excluding the small value of its fur. It is a pet in many houses in Oregon and Washington Territories, provided it has been captured while a cub, and as a general rule it is docile and easily tamed. Even while writing this letter I can see from my hotel window two agile bears playfully wrestling with a Newfoundland dog, and a third taking biscuit out of a sailor's pocket. But bruin is not always gentle, for should he get wounded while roaming abroad in his natural state, he will not hesitate a moment to attack his human adversary, should the latter be in anything like close proximity.

I have a very distinct recollection of my first encounter with a large black bear, and with what celerity I made one of the best retreats on record here, having not only jumped over fallen trees, and broken through shrubbery so thick that in ordinary times I could scarcely get my head through, but clambered up a vine maple so fragrant that ere I was half way up it began to bend under my weight, and there remained perched for half an hour while bruin rested beneath, eyeing me with anything but loving glances. The cause of this mishap was my own foolhardiness and want of experience; but the lesson impressed upon my memory that day has been very valuable to me on many occasions since.

Having expressed a desire to a friend who works on his farm in summer and hunts in winter, to enjoy the pleasure of killing a bear, he was pleased to assent to my proposal of slaughtering several hundred, so we prepared for the chase on a Thursday, intending to be absent two days. Our armament consisted of a muzzle loading rifle, which I carried, and a shot gun borne by my comrade; our food was confined to some boiled mutton and home made bread, and our companions to two small, active, and noisy curs, which thought it necessary to bark at every bird and animal encountered on our route. Having started at six A.M., we found ourselves twelve miles from home by ten o'clock, and deeply immersed in a dense forest of those gigantic firs indigenous to Washington Territory. After resting a few minutes to load our guns, we went searching for bear

signs, and soon found them plentiful enough. The curs were then set to working up bruin, and in a few seconds they were yelping in their loudest tone. I ran in one direction and my companion in the opposite, to head off our game should it break from a straight course. In about five minutes after starting I saw a dark object hopping among the shrubbery, and judging from its size that it was the animal whose life I sought with such pleasure, I raised my rifle, pointed it as steadily as my palpitating heart would permit, and banged away. When the echo of the report ceased I heard a thud as of some object falling, and this was followed by a painful, vicious growl. I moved forward cautiously, and peering into the bushes saw the lover of berries stretched on his side and gasping violently. I laid down my rifle, seized a fallen limb of a tree, which was both crooked and unwieldy, and gave bruin a tremendous whack with it on the occipital region. If I had left that undone I might have been all right. No sooner did the fallen one receive that unceremonious clout than he sprang up and made at me. I raised my club again, but as that blow broke my weapon, and as it did not seem to affect my adversary, there was nothing for me but to retreat and I did it in admirable style. I clambered over fallen trees of large dimensions, leaped the smaller ones, tore through shrubbery which lashed my face with incisive sharpness, and finally, reaching a clump of that many trunked tree known here as vine maple (*Acer circinnaturus*), I scrambled up one of the trunks with a speed of which I justly felt proud afterwards. Bruin followed close on my track during the race, and from his growls I expected every moment to be in his embrace, but his wound affected his coursing powers, so that I was fairly settled in my perch ere he arrived at its foot. I knew that he could not reach me, for his deep gasps and protruding tongue proved that my leaden pill had sapped the vigor of his frame. Had I been a hero of the chivalric school I would have left my retreat and attacked him with my bare arms, but I was too careful of my velvet coat to risk its getting torn, so I was content to study my guardian, which rested on vigorous haunches, to eye me well, in order to know me again, I suppose, and to keep shouting "hoo-pee," which the forest, in melodious, liquid cadence, repeated in many directions, and many times over. After waiting for what seemed to me half an hour, the resounding woods brought me back an answering shout, and in a few moments more the yelping of the curs a few rods off told me that the siege would soon be raised. The noise of the curs made bruin turn his head, but ere he had made up his mind to leave they were upon him, and such crying was never before disgorged from the larynx of two curs as that which emanated from those which dodged around my besieger, trying to get a snip at him as he began to beat a retreat. When he had gone a few yards off I descended from my tower and renewed my shouting, and in a few moments I heard "Where are you?" "Here; quick," said I, "I've got a bear; lend me your gun." When I received the latter I followed the curs, and in about ten minutes overtook them. Calling them off with some difficulty, I got a splendid shot at the side of my late guardian, or besieger, whichever he was, and let him have both barrels in rapid succession. I believe I killed him then, but his skin was so full of buckshot that it was useless to me. In examining where I first struck him I found that the ball had penetrated the neck, striking the anterior portion of the windpipe; hence, the cause of my escape from his embraces, as his wind was too limited to enable him to run well.

We killed five bears while out on that trip, two of which I claimed. In speaking of the courage of the black bear, my companion recited the cases of two men with whom he was acquainted who had suffered severely from the claws of this species of *ursus* after being wounded. One of them died a few days after the attack on him, and the other was torn so badly about the chest, arms, and face that he never recovered from his rough treatment. This bear will always flee from man unless attacked, but when wounded will make a gallant fight for existence. Another species of the ursidæ found here is *ursus* var. *cinnamomea*, if we

may call a difference in color a distinction in species. Many old hunters say that the brown and cinnamon are the offspring of the black bear, and that they have seen in one litter of cubs by the latter the two former colors. I am myself inclined to believe that they are the same species, for in specimens of claws presented to me I could see no difference in length between those of the two varieties. The average weight of this variety ranges from three to five hundred pounds, though some are much larger. The flesh is highly prized by the Indians, and they will go far to beg a piece of *itshoot*, or bear steak.

The largest of the species is the grizzly bear (*Ursus horribilis*), which ranges in weight from fifteen hundred to two thousand pounds. This is the bear of the mountains as its congener is of the forests, and is by far the most powerful animal known to this continent. It can crush a man as it would an egg shell, and one blow from its paw alone will kill its human adversary. A technical description of it would be about the following:—size very large; tail shorter than ears; hair coarse, darkest near base, with light tips; an erect mane between shoulders; feet large, fore claws double the length of the hinder; a dark dorsal stripe from occiput to tail, a lateral one on each side along the flanks, and nearly concealed by the light tips; intervals between the stripes lighter; hairs on body brownish yellow, or hoary at tips; parts around ears dusky; legs approaching black; muzzle pale. There are some which differ in color from the description given, but all belong to the same species. This bear is found extensively in California along the foothills of the coast and Cascade Ranges, wherever oaks and manzanita are found, for a great portion of their food consists of acorns and the berries of the latter. The manzanita, which is peculiar to the flora of the Pacific coast derives its botanical name (*arctostaphylos glauca*) from its association with this animal, *arktos* signifying bear in Greek. The fruit resembles that of the *arbutus uva ursi*, and to procure it bruin will travel far and face many dangers.

I have met several of these animals throughout California in a semi-domesticated state, but in no place did I see them so gentle as to bear too much familiarity. When the male and female are caged together they are incessantly quarrelling, especially at feeding time. Gallantry seems to be unknown to the burly male at such times, for he will attack his companion in the most vicious manner to recover even the smallest morsel of food. There is a rude but significant word in the Saxon to express the highest type of selfishness, namely, "hogghishness," yet bearishness would be more literally correct, for the suide are generous in comparison to the monarch of this continent. To kill one of the latter has been a feat to which many Nimrods have devoted their leisure time, and though several have been successful in accomplishing it single handed, yet the number who have not are much greater. For a hunt of this sort it is necessary to have several in a party, and to be armed with good breech loading rifles, for his majesty can start several bullets ere he resigns his spirit, and before that is done he may take with him to the spirit land some of his foes unless caution and sure aim are united. I attended one grizzly hunt in San Luis, Obispo county, in California, with a party of Spaniards; but while it was exciting enough, those scenes of danger of which I had heard so much were prominent by their absence. We started for the foothills at about four o'clock in the evening, and camped out that night, having made a rousing fire to keep away any quadrupedal intruders, and after supper devoted ourselves to puffing cigarettes, singing, and relating hunting experiences up to midnight. The last story told was by a swarthy, scarred old veteran, and according to his tale he had killed with his knife alone an *oso grande* in one of the canyons then near our headquarters. The next morning we were up before daybreak, and having saddled our horses—said to be veterans in such a chase, though rather dilapidated mustangs in appearance—and loaded our rifles, we deployed ourselves as skirmishers, keeping the form of a crescent, and in this manner moved towards a copse of oaks half a mile in front. We had some half a dozen mongrel dogs with us, and they were taken by one man to the top of the hill, so that they would run brin towards us. He took the precaution to keep to the leeward of the copse, for if even the daring grizzly caught the odor of humanity he would think it the better part of valor to beat a rapid retreat. The captain of the skirmish line gave us orders how to move by the wave of his hand, and all obeyed most promptly. Reaching the wood we held the reins tighter, grasped the saddle closer with our legs, and placed the barrel of the rifle in the crook of the left arm. This was no sooner done than the dogs gave tongue, the chorus became loud, then broken and general, and in a moment after a splendid male grizzly emerged from the bushes about one hundred yards distant. When he saw the circle around him he hesitated a moment, but the noise of the dogs soon decided his movements, so he made for the opening in front. Bang went a rifle, followed in a second by another. My horse, which had been restless, now showed undoubted terror; he wheeled and was making for the rear at his best pace, but when I got the reins out of my mouth and into my hands I gave the Spanish bit a touch that nearly threw my Rozinante on his haunches, and wheeling him I made for my place in the crescent. I found my mustang was not alone in his terror, for I saw two more making their best strides for home. When I reached my position bruin was making for that direction, as it was the only opening left. I fired at him twice in rapid succession, but at this moment that mustang became alarmed again at the object approaching, and wheeled to the rear. He had not gone far ere I checked him; caused him to make a demi-volt, and then got another shot. Bullets were whizzing thickly around his bearship at this time, and he did not go five yards further ere he fell, groaning, to the ground, and bleeding profusely. Two revolver shots in the head finished him, and our prize lay outstretched before us in all his inanimate majesty. Who killed him? Every one was willing to bet or swear that he had hit him, yet on examining the body only three bullets were found, though twenty must have been fired. The whole time occupied by this contest did not exceed five minutes, yet it would seem as though a small army was firing, so rapidly were the leaden missiles poured forth.

After the assembly was sounded by a loud halloo, the runaways returned, swearing as only Spaniards can at their ill luck and their cowardly steeds. Having dragged the bear into some bushes we again reformed our line and made in an oblique direction to the right, where the manzanita grew thickly. The dogs had scarcely entered the shrubbery ere a simultaneous yelp made us all halt. In a few moments a female broke cover, but seeing the number of

enemies surrounding her she again re-entered the bushes and made for a ravine on the right. Her course was marked by the swaying of the shrubbery, so to the right we all started at the best speed of our horses, intending to head her off. We had scarcely proceeded half a mile ere we struck a canyon, and into this we had the satisfaction of seeing our game hurl herself, for she apparently went to the bottom at one stride. That she was not injured, however, was proved by the yelping of the dogs, which pursued her for over a mile; but I may here add that they took very good care not to go too near her.

As we could not do much in the heat of the day, we concluded to return to camp and await the morrow for the resumption of our sport. During the evening, while lying around the fire, everybody was telling just how he missed or hit that animal, but who hit him is to this day a mystery, for the greater portion insisted that their bullets struck just where the holes were found. Whoever reached the vicinity of the heart, however, was the champion. The action of our veteran mustangs was accounted for on the ground that bruin emerged too suddenly, so did not give them time to think. This may have been the cause in Spanish eyes, but to me it looked like want of experience. Our camp was the scene of hilarity that evening, and the song, "*Lermosa esta la noche*," was sung many times over.

The next morning we were out again by dawn, but a four hours' tramp revealed no bears, so we returned home, myself, for one, highly pleased with my grizzly hunt. The animal killed, when placed on the scales, turned thirteen hundred pounds. A scrutinizing glance at his powerful limbs made us thank our stars that he had not been able to reach horse or rider.

This bear is found as far north as forty degrees, but is rather scarce beyond forty-two degrees. Its principal habitat in Oregon is in the Klamath Basin, in which are situated the now famous lava beds. It is but little hunted, owing to the sparseness of population there and the danger of the amusement. The last attempt at a chase resulted disastrously to one of the parties, the grizzly having overtaken him and killed him with one powerful stroke.

I shall close this article with an incident in grizzly hunting which displayed more humor than courage. Judge G—, of San Francisco, was very fond of the chase, so in company with four others he started for the mountains to have a week's run after grouse and quail. As the judge could not presume to enjoy himself without some strong tea (?) he was careful to take a large supply with him. The night before starting on the hunt he attended a ball, and before morning was so much under the influence of his favorite beverage that he tumbled in the mire several times on his way home. The consequence to his swallow tail and hat may be imagined. He had scarcely entered his room ere a carriage called to take him to the rendezvous; thence all moved some forty miles into the interior, and camped under some oak trees. While smoking around the fire a Spaniard approached the group and stated that a grizzly was a few rods off in the bushes. He was asked why he did not kill him, and he nonchalantly replied that he had lost no bears. The judge, who was dozing near the ashes, jumped up when he heard grizzly mentioned, and said that he would bring that bear into camp alone. His seedy appearance, and the quaintness of his hunting costume, caused his companions to shout heartily at his boast; but G—'s mettle was up, and with a half drunken leer he said he would prove it. He then seized a shot gun and moved into the bushes. He was gone perhaps ten minutes when a tremendous commotion was heard, as if twenty men were beating the shrubbery. In a moment out comes the judge, minus his hat, and running with such speed as to cause the swallow tails to extend backward in a straight line. As he approached the camp he shouted at the top of his voice. "Clear the track; here we come; the bear and me, look out there!" They did clear the track, and the limb of the law rushed through the fire; nor did he stop until he made a good mile to the rear. A few bullets checked bruin, and caused him to seek shelter, so the judge escaped with a good scare and being made the butt of many a joke.

"MORTIMER KERRY."

Portland, Oregon, April 1874.

For Forest and Stream.

FOREST SPORTS OF PENNSYLVANIA.

NUMBER ONE—THE MUSIC OF THE HOUNDS.

"COME, lads, tumble down here; the old woman has got breakfast nearly ready, and the dogs are spoiling to get loose." As old Tom Howler's cheery voice aroused me from the deep, dreamless slumber which my fifteen mile tramp of the previous day had produced, I opened my eyes in astonishment and looked with dozed bewilderment at the smoky rafters over my head, forgetting for the moment where I was. But the bronzed, weather-beaten face of Tom Howler, as he stood on the ladder, with his hands resting on the floor of the loft, brought all back—the railroad ride of the previous day, the tramp through the woods, our hearty welcome by Mr. Howler and his bustling, kind wife, and last of all, our stowing ourselves away in the loft. The morning had come at last, and to-day we were to go out with one of the best hunters, and certainly the best brace of hounds on the Kinzua. With a cheery greeting to old Tom, I sprang, or rather rolled (for our bed was on the floor) out of bed, and administered a vigorous kick to my friend Jack, who was still sleeping as if he had but just laid down. With a gasp and start that worthy young gentleman sat up suddenly in bed, almost lifting a portion of the roof off from the house, and being now dressed I crept down the rickety ladder, leaving Jack expressing his views of sky parlor bed chambers in language more forcible than elegant. After holding my head in the clear, sparkling waters of a brook which ran close to the house, I returned to discuss, with a keen appetite, a genuine backwoods breakfast of buckwheat cakes, maple syrup, bacon and eggs, and coffee.

We left the house about six o'clock and turned our faces up the Kinzua, keeping on an old log road that wound along the ridge that skirted the creek. After proceeding about a mile we halted to hold a consultation as to the best place to put the dogs out. This we of course left to Tom's judgment, and he finally decided to let them loose in a large huckleberry patch about a quarter of a mile back from the creek. A neighbor of his, who had occasion to pass through it only a day or two previously, had started a large drove of deer, and Tom felt confident that the dogs—Bill and Leo—would put up a deer in a very short time. We went on a little farther when we came to a spot where Tom informed us the runaway crossed the road.

At this point he stationed Jack, and with an admonition to be on the alert we left him and proceeded towards the creek. A walk of fifteen or twenty minutes' duration brought us to another log road, which we followed to the brow of a steep bluff, which terminated in the waters of the creek. A space twenty or thirty feet wide had been cleared down the face of the bluff for the purpose of rolling logs down into the water. Of late years, Tom said, the deer, when started from the west ridge, invariably made for this point, which was a good and easy means of access to the water. Following Tom's directions, I made my way almost to the bottom of the slide, and took up my station behind a rock, while he started for the huckleberry patch, leading the impatient dogs. From where I was standing I could command a charming vista of the swift running waters of the Kinzua, which flashed and glistened in the light of the rising sun. On the opposite side the trees, just turned to a bright crimson from the effects of the early October frosts, rose tier upon tier until they were lost sight of in the fog which was rolling up from the valley. A half hour passed away, and I still remained at my post, watching and listening, with every faculty on the alert, to catch the first sounds from the dogs. At last the long wished for sound reached my ear, first a short, sharp yelp, then, as each dog fairly got the scent, came the deep baying that sounds so pleasant to the sportsman's ears. The quarry was evidently heading for the water, and each moment the baying of the hounds grew nearer and clearer. I can imagine nothing more exciting nor more calculated to give pleasure to a keen sportsman than the baying of a couple or more of thoroughbred hounds as they follow a lively young buck over hill and dale. The blood tingled wildly through my veins as I grasped my double rifle more firmly, expecting every moment to see an antlered buck bounding down the declivity. I had become perfectly enthusiastic, and already, in imagination, I followed out the chase, the whizzing of our rifle balls, the panting, struggling deer, and then last, but by no means least, was the thought of rich venison for supper. My fancies were suddenly dispelled by hearing the sharp crack of Jack's rifle, showing me that he had sighted the game. With finger on each trigger I waited with bated breath the appearance of the game. Instead of coming towards me, however, the baying of the dogs told me that the chase had taken a different direction, the quarry having probably swerved when Jack fired. With a sigh of disappointment I dropped the stock of my gun on the ground, and listened to the baying of the dogs until their voices died away in the distance. Not long, however, did they remain out of hearing, for in a few moments their howl again reached my ears, low and indistinct at first, but gradually growing louder as they approached. Nearer and nearer they came, now growing fainter as they descended into some hollow, and then rising to a loud, prolonged howl as they ascended a hill. The game was undoubtedly coming towards me this time, and from the direction they were approaching they would give Jack a wide berth. Suddenly, like a flash of light, came a large buck over the verge. Another bound, and he reached the middle of the incline, when, as he lifted his feet in a last leap, my bullet struck him fairly between the antlers, and he fell quivering and kicking at my very feet. A few moments more and my keen hunting knife finished the work, and I stood up to survey my prize. A noble fellow he was, surely, with large branching antlers, a sleek, glossy hide, and trim, clean legs. The dogs now came in with a rush and a cry, and I soon had my hands full in keeping them off the dead deer. In a few minutes Jack and Tom made their appearance, the latter carrying a fine young doe which Jack had killed. We now proceeded to hang up our game, until such time as Tom could come after them with his team. This accomplished to our satisfaction, we rambled up the creek, shooting a few grouse, until the middle of the afternoon, when we returned to the house, very well satisfied with our first day's sport on the Kinzua.

"PLEASANT WING."

For Forest and Stream.

HOW I WENT HUNTING.

DEER SUR, I had bin borryin yure paper, the FOREST AND STREAM, an redin ov it til I got the hutin fever myself. So I went to the stoar to bi me a gun, sez I, mister hev yu got any good dubble barl shot guns? plenty ov 'em sez he, what sort of wun do yu want, sez he! Sumthing good an chepe sez I. Wel ho'll that do, sez he, and he guv me a gun stocked with a pece of walnut fens rail, and not even paneted at that; there wa'n't no brass fixins about her, she was all plain iron. The feller I hed been borryin the FORREST AN STREAM of sed I neded a stub twist gun, but I didn't se no twist on these barls, they was all over kinder notted and speckeld like what yu kall burds eye work. I didnt think much of the gun but thought mabe she was very chepe, so I axed what she was worth. Seventy five dollars sez he. Gol darn it, sez I, you think I'm a fule dont you? No sur, sez he, why? Axin seventy five dollars fur such a thing ez that, sez I. Sez he, that's a giniwine greener sez he, handin the gun to a feller standin by me, damaskus barls, three pin locks, and oil walnut stock. What do you mene sez I, feelin mad all over, and a hot streke runnin downe my back. Just what I say, sez he. I'll teech you better nor to call me a giniwine greener, sez I pulling off mi kote. I didnt kall you that, sez he. Who did you kall that then? sez I. Why, the gun ov coarse, sed he. Then all the fellers that was in the stoar bust out laffin, fit to kill thereselves, and sed I must treat, so I had to do it.

Then I went back to bi a gun. Now sez the stoar keeper, you jist cum round here an pick out a nice one, for I wer mad now and didnt keef for expens. The stock was painted black, and shined till you cood see yureself in it. The trimmins was all of brass, and the locks and hammers was all shined up bright as a dollar. The barls was bout a quarter of an inch thick at the muzzle, so I knew there was'n't no danger of bustin her. They wer a red brown color, and showed the twist from one end to tother, jist as plane as the rings on a coon's tale. What makes her look so ruff inside? sez I. A ruff gun shoots better, sez he.

What's she worth, sez I. Fifty dollars, sez he, and I'll thro in a shot bag and powder flask, and a wad cutter, to pay for that treat we got off'n you. What is a wad cutter? sez I. Why a punch to cut wads with sez he, winkin at take her. So I paid him, got some amminishun, and started out. Say, sez he, you had better not load her too heavy at first, before she gets used to it, you know. Then all the fellers, and there wur a lot of 'em by this time, they all laffed agin, and the stoar keeper stuck his tung in his cheek

and didn't laff any, so I knowed he warn't joking this time. I took the gun home and showed it to Harry, he's the feller I borrowed the FORREST AND STREEME of you know. How do you like her? sez I. Oh! I don't know, sez he; what did she cost you? Fifty, sez I. Now what are you laffin at? sez I, for he was laffin fit to split. Just to think what a fool that stoar keeper wer, sez he. I cheated him, did I? sez I. Perhaps, sed he. Less go huntin Harry, sez I. Can't to-day, but I'll let you take Dash (that's Harry's bird dog) if you want to go. So I took the dog and went out into a big stubbel felde, where Harry said there was lots of quale. Dash hunted bully for about fifteen minits, an' then stopped plum still, and woodn't budge a peg. I kalled him, an' coaxed him, and sicked him till I got mad, and then walked up and kicked him, when up got a whole flock of quale. You tarded cuss sez I, I'll show you how to scare birds up before I see 'em, so I out with my ram rod and feched him one over the hed, and broke the rod, I tell you I *wer mad* then, but I wasn't going to be fuled out of my hunt, I had too lodes in the gun any how. Jist then I see a crow light on the fence, at tother side of the feeld, I thought I'd shute him, and then go home. The crick bank wer about ten feet high, and there were just room fur me to walk between the bank and the water, so I got down there and walked along till I got to a bend in the crick, where I was just even with the cro. I stratened up as hi as I cood, but I coodn't see the cro. Then I climbed up the bank, which was nearly rite strate up, and about ten fete hi. I streched up hi as I cood on my nees, and then I see him. He was about forty rods from me but I had bin readin about some awful long shots in other sporting papers, and now thinks I, my fifty dollar gun shall beet 'em all, and I'll have Harry to send it to the paper. I stretched up jist as high as I cood on mi nees and out loose. The gun didn't go off, a—w, a—w, sed the crow, but he didn't fli. Then I tried tother barl, I guess you'd a thoght it went off if you'd bin behind it. It knocked me off the bank rite into the water; there were a little ice on the water, but that didn't stop me enny, for I fel ten fete. When I cum to the top I hurd somebody laffin agin, and there on top of the bank was Harry and that cuss that maid me trete at the gun stoar. They hed wached me, and follered me, when I went down the crick bank, and they was laying in the grass right behind me on tother side of the crick when I shot. I was mad enuff to whip both of 'em, but they sed they would keep mum and help get the gun out if I wouldn't, so we went to fishing for it, I made beleve it was all right till I got a good chance and then pushed the other feller in. He come up laffin, and me and Harry was laffin too. Comin up to me, sez he, its all right, but I'll tell you what, you'll never get that gun till you dive for it, so here goes, and before I knowed what he was doin, he tuk me by the cote collar and back of my britches and piched me in head foremost. I were so mad, I tried to git a rock off'n the bottom and got hold of the gun! Thar, I tolde you so, said the other feller. Well the tube and hammer were gone from the barl I shot, and tother one wouldn't stand cocked. What do you spose has gone with that hammer and tube? Turtles eat e'm off said Harry. Is that so? sez I. Coarse it is, sed tother feller. Les see if tother barl's loaded, sez Harry. Coarse it is, sed I. No taint, sed Harry, you put both loads in one barl. It kost fower dollers to git the gun fixed. Next time I'll tell you how I got so I kould shute birds a flyin, and how I trained sum puppeys.

JEHIEL SLAB.

P. S.—I didn't kil that cro.

For Forest and Stream.

GRAND MANAN.

THE Island of Grand Manan is situated in the Bay of Fundy, about thirty miles south-east of Eastport, Maine. It is thirty miles long and about nine miles wide, and lies in nearly a north and south direction. There are two small villages on the island and habitations are scattered over its greater part. There are a few saw mills in the timber sections which furnish a comparatively small amount of lumber for building purposes, as they are chiefly used in preparing material for herring boxes; which are sold to the fishermen at two and two and a half dollars per hundred. Nearly every man on the island owns one or more smoke houses which are used for curing herring. In 1872 herring were bringing but nine and fourteen cents per box, and the fishermen were complaining bitterly at the low prices for their fish. Salt cod-fish was worth but four and five dollars per one hundred and twelve pounds, and pollock and hake were worth but three and one-half cents per pound by the hundred weight.

There are several small streams on Grand Manan which contain trout. The largest one I ever caught there did not weigh but eight ounces, but small as they were they were not rejected by us hungry collectors. Agriculture is sadly neglected by the inhabitants of Grand Manan and adjacent islands. A few potatoes, oats and lettuce, are all that are raised. The season is late, the summer short and the fogs, which are of long duration, prove detrimental to vegetable productions. The south, west and north coasts of the island are rocky and abrupt. At its northern end a perpendicular rock rises six hundred feet from the water's edge and is called the North Head. A little to the east of that is a large cove called Whale Cove, because the whales used to resort there to feed in the tide streaks. In fact they often make their appearance there at the present time.

In Whale Cove, near the main island, is a high perpendicular rock, with four vertical sides which stands like a lone sentinel under the dark cliffs. It is called the Bishop's Head, and is well-known by all craft that navigate the Bay of Fundy. Several years ago a large vessel was wrecked one cold winter's night, during a heavy snow, on the rocky shore of Whale Cove. All the crew were drowned or frozen except one negro who had both his legs frozen off, and is now walking on their stumps in the village at Swallowtail Light, near the place where the unfortunate wreck occurred. On the north-east corner of the island is a large high rocky point which is cleft in the shape of the forked tail of the swallow, and has long been known as the Swallowtail Rock. On the top of the rock is a light house, and a little to the south of the light, is a large cove where all vessels find a snug harbor.

On the western side of the island the coast is rocky and precipitous. There are two large overhanging cliffs which are known as the Old Maids, which are given a wide berth by coasters. The southern end of the island very much resembles its northern end or North Head, and is called South Head. It is a favorite breeding ground of the herring gulls, (*Larus argentatus*), and their eggs are sought

and used as food. The Passamaquoddy and Mickmack Indians live near South Head and hunt the porpoise and seal for their oil. They often go to Eastport, (Passamaquoddy,) in their small canoes, a distance of thirty miles over an open sea. The eastern coast of Grand Manan is low compared with its other shores, and it is that side of the island that is mostly inhabited. It is covered principally with spruce and birch timber, and it has the peculiar mossy spruce swamps which are common to northern Maine. Several years ago deer were common on the island, but the Indians and whites combined, have nearly exterminated them. There are a few ruffed grouse, woodcock, thrushes, (Hermit, olive backed and golden crowned,) robins, swallows, (barn, white-bellied, and bank swallows,) warblers, flycatchers, &c., &c., that are found on the island, also the hare, gray rabbit and red squirrel. To the south-east, and east of Grand Manan are many beautiful islands which are full of interest to the Naturalist. They are as follows: Two Islands, Three Islands, White Head, Eastern and Western Green Islands, Sheep, Pumpkin, Low Duck, Little Duck, Big Duck, Long, Ross, Cheney's Head, and Nantucket Islands. To the south-east are the Black Ox, Seal, Eastern, Western and Yellow Merle ledges, which are favorite breeding grounds of the seals. There is also one small island called the White Horse, which is a general "headquarters" and breeding ground of the Leach's Petrels. They burrow into the rich loam and deposit one egg in each hole. When caught in the hand they disgorge a brownish oil which is not very sweet scented. The eider duck and black guillemot breeds on the rocky shores of the numerous islands, and an occasional pair of arctic puffins, (parrot bill murre,) are found breeding in the same localities. The razor-billed auk breeds in considerable numbers on the Yellow Merle ledges, and twelve years ago it was common to nearly all the islands of the Bay of Fundy. The island of Grand Manan is a good collecting ground for the naturalist at any season. In the autumn the ornithologist can collect the following birds in the Bay of Fundy:—Loon, red-throated diver, foolish guillemot, little auk, eider duck, pomarine skua, (gull chaser,) herring gull, Wilson's tern, black guillemot, puffin, great black-backed gull, purple sandpipers, red phalarope, &c., &c.

Those who enjoy fishing can gaff lobsters, spear flounders, catch cod, hake, pollock, and an occasional halibut. The waters of the bay offer great facilities for making skeletons, which is of great value to the naturalist. One has only to sink his specimen in a net in the water and the sea fleas, sea urchins, and marine insects, will clean a large skeleton beautifully in a single night. I would say in conclusion, that Grand Manan can be reached by any of the following routes from Boston. The quickest route is by rail, by the Boston and Maine Railroad, to Milltown, Me., and from there by boat to Eastport, thence by some fisherman's boat or the British mail packet to Grand Manan. The boats of the International Steamship Company ply between Boston, Portland and Eastport, and any person can go by boat the entire distance from New York, if they wish to, by connecting with the Boston steamers for St. John.

If any of the readers of the FOREST AND STREAM wish to visit Grand Manan, they would do well to "put up" at the house of Simeon F. Cheney, Nantucket Island, where they can have the best of accommodations, boats, &c. Mr. Cheney can tell you what Audubon did when in his locality, how certain birds have ceased to breed in certain localities, and what he does not know about the Bay of Fundy and its tides, rocks, islands, fish, and birds, after studying them for fifty years, is not worth knowing. I can testify to the above facts as Mr. Cheney showed me every thing of note to the ornithologist within forty miles of Grand Manan, during nine weeks steady researches for natural information.

J. H. BATTY.

—The harbor of Halifax being of the utmost importance to the whole commercial world, we take particular notice of the efforts now made by the Royal Halifax Yacht club to prevent the injury caused by the throwing of ballast in the harbor. Exactly as legislation in regard to the close seasons is getting to be influenced more and more by the practical knowledge of the sportsman, in the same way yachtsmen in their cruising become perfectly familiar with their harbors and have a right to be heard in regard to any impediments put in the way of navigation. We take, then, great pleasure in publishing the following:—

At the regular quarterly meeting of the "Royal Halifax Yacht Club," held at the Club House, on Monday, the 13th day of April, 1874, *inter alia*, on motion of Alex. W. Scott, Esq., Rear Commodore, seconded by C. A. Hutchins, Esq., the following resolution was unanimously adopted:

WHEREAS, The "Royal Halifax Yacht Club," through the report of their Special Committee, dated 26th May, 1871, brought to the notice of the Dominion Government the vital necessity of stopping the practice (which had for years existed) of throwing ballast and rubbish into Halifax Harbor, to the great detriment of the anchorage;

And, Whereas, The Dominion Government, through such representations, created the office of Harbor Master, and appointed an incumbent principally with a view to check said practices;

And Whereas, It has been brought to the notice of the said club that notwithstanding the stringent regulations made for the government of the harbor, the practice is still permitted to continue, and that thousands of tons of dock dredgings have recently been emptied into the harbor to the great injury of the holding ground;

Therefore, Resolved, That the "Royal Halifax Yacht Club" view with apprehension and alarm the serious consequences that must inevitably arise from a continuance of such violation of the law, and beg to call the attention of the Minister of Marine to this most important subject, with a hope that it will receive at his hands the full consideration it undoubtedly deserves.

Also, Resolved, That the Chamber of Commerce be earnestly solicited to unite with the "Royal Halifax Yacht Club" in their efforts to prevent the total ruin of the anchorage of Halifax Harbor, and as Imperial interests would necessarily be materially affected thereby, that the attention of the Vice Admiral Commanding on the Station, be also called to the subject.

GEORGE M. GREER, Secretary.

—At last a cure is found for cold in the head. Dr. Poillon, a French physician, says it can be cured by inhaling hartshorn. The inhalation by the nose should be seven or eight times in five minutes.

HOW TO TELL A FRESHLY CAUGHT SHAD.—First decide what you want to tell him, then whisper it in his ear.

New Publications.

Popular Science Monthly. April. D. Appleton & Co.

With this number is closed the second year and the fourth volume of this valuable contribution to scientific literature. How well appreciated this work has been for the last year the testimonials of many readers can and do daily verify. It comes to us this month with very interesting research into the hidden mysteries of many things, theories only before, but now revealed and canvassed as facts, stripped of illusion and fancy. 1. "The Age of Ice," with illustrations, will be found full of new ideas, and very readable. One rises from its perusal with many corrected suppositions, and is the first one to confess to many errors of conception. "The Pathology of the Passions" will be found a paper of great value, and the illustrations on page 661—the force or contagion of good or bad example—will readily commend itself to everyone at all acquainted with the passionate nature of man. "The Mautis, or the Praying Insect," is a curious history of a curious insect, which must be read from the work itself to be understood. A complete and full number, fully equal to any of the same yet published.

HISTORY OF NORTH AMERICAN BIRDS. By S. F. Baird, T. M. Brewer and R. Ridgway. Illustrated with 64 colored plates and 593 wood cuts. Boston: Little, Brown & Co. 1874. Vol. III, pp. 569, xxviii.

Our thanks are due for a copy of the third volume of this great work, of which we might say all that need be said in the statement that it fully sustains the reputation of the first two volumes. We trust that the concluding portion of the work may not be long delayed in reaching us, as then we shall be provided with a complete treatise upon the subject from the highest living authority.

This volume comprises the large and important groups of the *Raptores* or Birds of Prey, the *Columbidae*, or Pigeons and Doves, and the *Gallinae*, including the Grouse, Partridges, or Quail, Ptarmigan, and their allies—all birds of the highest interest to sportsmen. About half the volume is occupied with the raptorial families of the hawks, owls and vultures. This elaborate monograph is entirely from the pen of Mr. Ridgway, as far as the technicalities are concerned, Dr. Brewer, as usual, preparing the biographical portions. Mr. Ridgway, as ornithologists are aware, has for several years devoted special attention to this group, with what great success need not be here enlarged upon. From time to time various scientific papers have appeared from him on particular genera, informing us of the progress of his studies; and in the present work we have his crowning results, as far as North American species are concerned. May we not hope soon to see his monograph upon the *Raptores* at large? The same admirable conservatism which has guided the authors throughout the work is here apparent in the large reduction of nominal species to varieties of mere synonyms; the good species with their geographical varieties are treated in exhaustive detail, the whole subject being placed upon a far more satisfactory footing than it has before rested upon. Several novelties appear, especially the curious *Onychophanes gruberi*; several new generic names are established, as *Antenor*, *Pseudogryphus*, and *Rhinogryphus*; but, by the way, is not "Parabuteo" a mistake? We are pleased, on the whole, that the authors have, in the case of the *Raptores*, departed from their custom of giving colored heads. These heads of the Birds of Prey would not have been characteristic, for these birds do not carry their likeness on their face, but on their tail, which latter affords in most cases the reliable guide. This omission of colored heads—as some uninformed persons might consider it—is more than condoned by the number and beauty of the full-length wood cuts, one of which is given for every species (instead, as heretofore, of only one species of each genus), in addition to the profuse outline illustrations of details, which, in this family, embrace a number of sketches of osteological characters derived from the skull and breast-bone. The curious asymmetry of *Nyctale* and other strigine genera is finely given.

Sportsmen will be more pleased perhaps with this volume than with the preceding ones, as it includes their favorite game birds. It is an earnest of what they may expect in the subsequent volumes, when the woodcock, snipe, bay-birds and waterfowl come to be treated. There need subsist no longer the slightest doubt or uncertainty respecting the proper names and classification of grouse, partridges and quail, while their physical characters are given with the minutest detail, enabling a specimen in any plumage to be at once referred to its proper genus and species. With Dr. Brewer's excellent and thorough biographies this portion of the work represents the best treatise extant upon the interesting and valuable birds in question.

The volume closes with an appendix, giving numerous late miscellaneous particulars upon all the birds treated in the first three volumes, with full indices, and with a very copious glossary of technical terms, the latter prepared—evidently with great care—by Dr. Cones.

ANNOUNCEMENT.

George W. Carleton & Co., will shortly publish the famous novel "Dr. Antonia." It made quite a stir in the literary world some years ago. We are glad to announce the re-issue of the same in Carleton & Co.'s good style.

EXTENSIVE ART GALLERY.—Next to the Bible, no book is more useful than Webster's Dictionary. The Unabridged is an extensive art gallery, containing over three thousand engravings, representing every animal, insect, reptile, implement, plant, &c., which we know anything about. It is a vast library, giving information on almost every mentionable subject. It indeed has been well remarked that it is the most remarkable compendium of human knowledge in our language.—*Household Advocate*.

—There was something both peculiar and particular in regard to the deer we are writing about. In the first place he was snow white and of shapely form; and secondly, his albinoship had for the last three mortal years bothered every huntsman in Pike County, Pennsylvania. Those famous woodsmen, the Westbrooks, had spent many a weary day in pursuit of him. Uncle Ira Chrissman, with his wonderful Kentucky swivel breech loader, an antiquated but cunning heirloom, a piece of ordnance known all through the Keystone State, had often covered that white deer, and though the celebrated gun had "pinted plumb," that white buck had never come in. Old man Bart and the Quicks, all had wasted shoe leather over the snow white deer, but were never able to get him. In time, in Pike County, mysterious stories were rife about him and over camp fires, silver bullets and the incantations necessary, in order to fetch that deer were darkly hinted at. Somehow or other, though he had escapes innumerable, he never had been fothed. It seems that a family of white deer must have taken up quarters in that section of country, as a pond has long gone by the name of White Deer Pond. We had half a hope that after all the white deer would have lived on to perpetuate his race, but this week we had a visit from Mr. Shimer, mine host of the Exchange Hotel, Wilkes-barre. Mr. Shimer is an example of patience and of huntsman's skill. Suffice to say Mr. Shimer last winter went for that deer, and no other deer, and got him. He was a white buck and weighed over 125 pounds, and his snow white buckskin, with the hair on, nicely tanned, is to-day one of Mr. Shimer's trophies. Some fifteen years ago a white doe was caught in this same neighborhood and was bought by some gentlemen and placed in one of the Philadelphia parks,

For Forest and Stream.
TO THE SNOW.

ON the ground the snow is lying,
Flake with flake in whiteness vieing,
And the wind is softly sighing
Thro' the trees in sweetness rare.
In the heavens' azure lining,
Myriad golden stars are shining,
And a sweetness and completeness
Inter-penetrates the air.

When the night in shadow steeping
The world, and all its silent sleeping
Life that late so gay was leaping
In the waves of sunlight bright;
Then the snow sends up its greeting
To the stars, that answer peeping,
And its whiteness and their brightness
Thrill the being of the night.

I wonder if the snow is thinking—
As it lies there, silent, drinking
In the rays that seem fast linking
It unto those starry eyes—
Of the time when spring's warmth surging,
Shall supply the needed urging
That will thrill it thro', and fill it
With the strength to reach the skies!

When, once more, a cloud careering,
With the lightning brightly peering
From its eyes, a pathway clearing
That the thunderbolts be rolled;
Or, with loveliness o'er-creaming,
Floateth in the sunset, dreaming,
While the sun laves with his bright waves
All the world in red and gold. TRANSIT.

Natural History.

For Forest and Stream.
TAKE CARE OF THE TOADS—"ARLINGTON NED."

YES, take care of the toad; that homely old toad that is such a very familiar fellow, and who is always to be found waiting for my appearance in the garden. This old fellow has been an inhabitant of my garden for quite a number of years. When I first made his acquaintance he was quite small, but he has grown considerably every year for the past seven years, and now he is quite a large sized, well developed toad. And this toad is by no means a toady; he is not a fawning scycophant; he means to get his morning quota of worms honestly, and see how his bright, intelligent eye shines as I hold up to his view a nice, large, plump earth worm. Look! he lifts his head, winks his little bright eyes rapidly, and confidently hops up to my very feet. How patiently he awaits my giving him his accustomed "morning worm." There is no toadyism in the character of my toad. "Ned," as I call him, puts on no airs; he is the same old toad to-day, the same honest, persevering "worm killer" this year that he was when we first became acquainted on one fine morning in the April of 1867. Ever since—from about the 1st to the 10th of April in each year—Ned has made his annual appearance in my Arlington garden as regularly as the year rolls round. He is sure to come from a certain portion of my grounds, and one little fact of natural, historical interest, or animal instinct, whichever you please to call it, is quite sure to place him before me fresh, bright, and winking either under the large hemlock, or beneath the foot limbs of my Norway spruce grove, or in the serpentine border walks among the tall yucca leaves. Yes, "Old Ned," as I call him now, is sure to turn up at this time, and very nearly in one of these places. Now it is worthy of a thought to just know where he emerges from, and where he makes his winter home. He seems to know that he is not recognized as a toady, but welcomed as an old friend, for he comes forth with as much confidence in the goodness of human nature as the latest elected member of Congress. I was about to say that in other comparisons the similarity would hold good, but I forbear. I would not do even an animal as humble and useful as thou art, Ned, the injustice to carry out the comparison, for thou art an honest, true old toad. To pass from this slight digression, and return to this useful animal in the garden, no lover of good things will ever wantonly injure even the homely toad; and while he is pleased to encourage the building of nests by his pet feathered friends amid the branches and boughs of the trees overhead, let him not forget the "speckled bellied" or "white bellied" toads that hop so confidently about at the roots, snapping up the big and little bugs and worms which he finds in this good location. Every insect was made for a wise purpose, and by the way that Ned gobbles them up I am verily inclined to think that they were made to fill a place in the economy of life for the especial purpose of filling up Ned's stomach. Could any of our readers on some clear, still morning see Ned picking up the worms and bugs, they would fancy they could almost hear his mouth snap, so rapidly does he open and shut it when making his early breakfast. In all soberness of narration and carefulness of observation I have counted forty worms and some ten or more large bugs and larvæ of insects disposed of by him at one breakfast. Just as soon as he has finished his breakfast he retires beneath the shade of his hemlock tree, and near the base of a flat stone gives himself over to meditation, I presume. Here he remains until late in the afternoon, or until hungry again, when he commences his hopping tour about the garden.

Ned is certainly an intelligent individual of the toad species. He is fond of music, and accident first revealed to our family his appreciation of it. It was nearly evening, and a lady of the family was singing to piano accompani-

ment, when we looked from the front door of the house, down the extreme length of the walk, and saw Ned hopping along the gravel walk approaching the house. The peculiar movements, and his liveliness, attracted particular attention. "Where is Ned bound to in such haste?" said one. The mystery was soon solved. Straight to the steps of the front door Ned approached, halting not until he had gained the lower stair. Here he sat and listened, apparently to the music, with as much devotion and attention as any one of the party. Emboldened by the kind treatment he received, or his love of the sweet concord, he hopped upon the top step of the door, and approached into the very hall. Here he sat quiet and dignified, and listened until the music ceased, when he turned himself about and hopped back a part of the length of the walk. The music was repeated, and Ned again returned to his old position of an attentive listener upon the steps. This was three times repeated on this evening, and at many times afterwards this same love for music was manifested by him. The question that this veritable fact leaves with my readers is, "Are toads lovers of music; are they not to a certain extent reasoning animals?"

Ned, as usual, made his first appearance for this season, lively and well, his eyes bright and twinkling, on the morning of April 14, 1874. L. WYMAN.

—There is a fish preserved in the College of Surgeons, London, which has another fish in its stomach, and that another fish in its stomach, and so on to the number of four.

DO QUAIL WITHHOLD THEIR SCENT?

SUFFERN, N. Y., April 17, 1874.

EDITOR FOREST AND STREAM:—

Being a constant reader of your valuable paper, and reading the many and varied opinions of different sportsmen in relation to the quail and their scent, the power of withholding it, &c., prompts me to send you my views on the subject—views that may not be accepted by the many, but to a few who, like myself, have carefully studied the bird and its habits, have formed their opinions from actual observation.

It is a well known fact that a wet bird, or a dead one, a running bird, or a wounded one, and a bird that has not been disturbed (except a "setting" one), are easily found by a good dog, whilst a bird upon being hunted soon after it has "lighted" (after flushing) is very hard for the dog to scent. Now, taking the above as undisputed facts, I shall try and show how and why this is so, and with the simple declaration that the scent of the bird is in its body, I'll endeavor to prove it, as this fact, if sustained, covers the whole question. A frightened bird sits closely to ground, its feathers lying smoothly and compactly on its person; it breathes carefully, gently, ah! so gently as scarcely to disturb a feather. Look at it closely. Were it not for its position and that sparkling eye, you would pronounce it dead. No motion there; all is "death in life." Your setter on a point was never so still as that, although his breath was suspended for a long time, and he looked more like a statue than old Dash—Oh! no. And do you wonder now, after seeing this bird, why the dog can't get the scent? It cannot work through those closely fitting feathers until the regular breathing of the bird is strong enough to make the lungs expand and the body, and with it the opening of the feathers; then, and not till then, can the dog scent game.

A "setting" bird, by reason of its regular, gentle breathing, is difficult for the dog to scent; still, by reason of its elevation, caused by the eggs, together with the odor arising from the nest, any good dog will, if close enough, and having fair wind, not only scent, but point, such birds. I have seen it done many times. A bird in motion (running), by the action of its muscles and limbs, allows the scent to escape freely. A wet bird, by reason of the steam arising from its body, passes off readily. A wounded one, through its wound and pain incident thereto, breathes heavily, and the bird, before dying, in its struggle for life, in its long inhalations and respirations, causes the feathers to expand wider and wider, until they stand nearly upright, and in death they do not regain their "fitness" to the body. So that each and all of these four throw off scent sufficient to enable the dog to find them without much trouble.

And now, being at the bottom of my paper, I have only to add that, whether the above meets with the assent or dissent of any of my brother sportsmen, I care not, for I don't get a cent for putting them on the right scent. I have the honor to be,

Very respectfully yours,

E. S. WANMAKER.

DO QUAIL EAT CHINCH BUGS?

LAWRENCE, Kan., April 14, 1874.

EDITOR FOREST AND STREAM:—

You may think the above a curious question to ask, but believe me there is much more importance attached to it than you may at first think for, and for this reason: Quail are very plenty in this State, and it is the earnest desire of every true sportsman to keep them so.

Unfortunately, the laws of the State permit the trapping or netting of them on one's own premises. The result of this is, that thousands are every season brought into market here or shipped abroad.

During last season they were brought into this market in such quantities as to become a perfect drug, selling at 40c. to 50c. per dozen, and at one point in southern Kansas one man alone bought and shipped over 5,000 quail and some 7,000 grouse (pinnated), very few, if any, of which were shot, but all netted or trapped. Of course the result of such wholesale destruction can but be one thing—the utter extermination of them throughout the State. Already its effects are noticeable in localities where we have heretofore made our best bags, it being a difficult matter now to find a single bevy, where they used to be in the greatest abundance.

Deeply impressed with the necessity of putting a stop to such an outrageous course, ere it be too late, a few of us have endeavored, through our representatives, to have the law changed; and this brings me to my point. We are met at once with the hue and cry "that we sportsmen want to shoot all the birds," and (mark the inconsistency of the thing) "the quail destroy the chinch bugs!" and therefore the shooting of them should not be allowed." Mind you, nothing is said about the thousands that are netted. Oh, no; it is not the netting that is doing the mischief, but the shooting that is destroying so many of these public benefactors, who amuse themselves by eating up so many chinch bugs, whereas any one knows that one net can do more damage in the course of a season than twenty guns. But this is not the point I am after.

Do Quail ever eat Chinch Bugs? That is the question we would like decided, and to that end we would not only like your own individual opinion, but also that of our other brother sportsmen in general. It has been our opinion always that it was the food on which the different kinds of game fed, that gave to their flesh the flavor in many cases so highly esteemed (e. g. canvas-backs and celery). We can, therefore, hardly reconcile ourselves to the belief that our little friends take much stock in the chinch bug. Just think of it—quail flavored with chinch bugs! Ye gods! what a calamity on the best little bird that flies.

By helping us to decide this question you may enable us to silence our antagonists' guns, on this one point anyway. Whether we shall ever be able to spike them on the netting business, time alone can determine.

The general law you advocate for the whole United States, would do

the business effectually, and most earnestly do we bid it God speed; it is just what we want.

In closing, allow me to ask if you did not make an error in your table of "Close Seasons," in reference to this State? Our close is from March 1st to August 1st, and so on, not, *vice versa*, as it reads. Truly yours, E—.

We are wholly in the dark as to the question asked. Perhaps our friends of the West Jersey Game Protective Society can answer, inasmuch as they are engaged in breeding quail.—ED.

TORONTO, April 11, 1874.

EDITOR FOREST AND STREAM:—

In one of your numbers I noticed a short account of a trout which contained within it a tape worm, which recalled a similar fact of which I was witness. About ten years ago I spent a week at Des Joachims, 40 miles above Pembroke on the Upper Ottawa, in the beginning of June. I took possession of a deserted lumber shanty at Presque Isle, a few miles below Des Joachims, and made daily visits to the little lakes three or four miles back from the river, where I found very good trout.

At Teapot Lake the fish were very abundant, ranging from half pound to two pounds weight. On opening them I found a large number, I think the majority, infested with tape worms, about $\frac{1}{2}$ inch wide and from 12 to 14 inches long. We were not deterred, however, from using the trout freely as food, but of course we were very careful in cleaning them. Our party of four partook of them daily and without any disagreeable consequences.

This is the only time when I noticed this occurrence, although I have had very considerable experience in trouting in Canada, from Cape Breton to Thunder Bay. Yours truly, JAS. W. RICHARDSON.

EDITOR FOREST AND STREAM:—

Your Philadelphia correspondent, A. M. S., asks through your journal the proper name for the fish he describes, and says it is popularly known as the fall fish in Maryland.

He refers to the chub fall fish, (*Leuciscus nothus*), very common in all the streams flowing into the Schuylkill and also in the river itself, and often growing to sixteen and eighteen inches in length.

I have taken it with a fly in Cobb and Crum Creeks, Delaware county, on bright days in spring and summer, and it affords considerable amusement when one wishes to give an afternoon to a remembrance of trout fishing.

They are flat and muddy in taste and very inferior table fish.

Homo.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
New York, April 26, 1874. }

Animals received at Central Park Menagerie for the week ending April 25, 1874:

Three Australian Cranes, *Grus Australasiana*.
One Jagnar, *Felis onca*. Hab. South America.

Fish Culture.

This Journal is the Official Organ of the Fish Cultur-
ists' Association.

—Mr. H. H. Thomas, of Randolph, New York, has on hand several hundred thousand trout fry at his "Trout Grove" establishment, and is laying out his grounds for a pleasure park at large expense. Mr. Randolph is half owner of the Trout Grove Fishery, and of the "Hills" and "Crystal Springs Fisheries," and superintendent of all. We shall soon give a description of these works.

WASHINGTON, D. C., April 11, 1874.

EDITOR FOREST AND STREAM:—

Your opinion is respectfully requested by many amateur sportsmen of this district on the following statement: In February last some 30,000 young salmon were placed in the small tributaries of the Potomac for the purpose of propagating that valuable fish and stocking our river with it. It was authentically stated at the time that the fish thus placed in the upper streams would not return in fit order and of proper weight to be caught in less than four years. Now, a friend of mine, an old and experienced Scotchman, who is thoroughly acquainted with the whole matter of propagating and preserving salmon in the rivers of Scotland, has told me that salmon spawned in winter come back from the sea as grilse weighing from four to seven pounds. The second season they come back as spawning salmon.

Can you explain this enormous discrepancy on any rational principles? The fish placed in the Potomac are three inches long, and yet, the fish spawned in Scotland, at the same season of the year, come to maturity in half the time that we are led to expect from our new brood of Potomac salmon. Is it because the Scotland fish are nearer the sea? Or do they gain any advantage from the ocean currents caused by the gulf stream? Or is there some other hidden solution to this, (as it seems to me,) interesting conundrum?

An answer in your columns to one or all of the above questions will greatly oblige many of your constant readers. Yours respectfully, C. E. T.

[Your Scotchman is right as to the salmon returning in three years. They return in three years in this country. It is an experiment, and may be a success and may not. If they come they will come in three years. Whoever said to the contrary did not know anything about it. If the salmon come back in the spring, when the rivers are filled with shad nets, they will find a hard road to travel.—ED.]

—The following letter throws additional light upon the grayling subject. Bit by bit we are picking up what we seek to know, and before another year passes we trust the grayling and ourselves will be no strangers:—

ST. DENNIS HOTEL, April 27, 1874.

EDITOR FOREST AND STREAM:—

I have read with interest Mr. Fred. Mather's graphic account of his successful expedition transmitting the lively "grayling" from Michigan to his ponds at Honeoye Falls—he mentions "Tennyson" as probably taking poetic license in associating the speckled trout and grayling as inhabitants of the same stream. I can vouch for the correctness of our Poet Laureate, as the Clyde in Scotland is plentifully stocked with both fish, who seem to live harmoniously together, and having different resources prolong the fisherman's sport upon that beautiful stream.

The West of Scotland Angling Club, some twenty years ago, conceived the idea of introducing grayling from Derbyshire, in England, into the Clyde, which was carried out most successfully by introducing the fish from ponds commencing with the river—after having acclimatized them—experience there having borne out the statement of Sir Humphrey Davy "that they are apt to migrate down rather than up stream." It would therefore be advisable to

introduce them in high waters. From all we know, the fish live and thrive well together. I have taken particular interest in this matter, my father, Mr. J. D. Dougall, being a member of the Club, who took considerable pride in the introduction of the grayling into Scotland.

While upon a visit to this country last spring I was fortunate enough in being an invited guest of Mr. Andrew Clerk to partake of the first dish of grayling ever served in New York, at Sutherland's restaurant, and have happy reminiscences of the meeting.

Yours respectfully, JOHN C. DOUGALL.

We should have stated in our last number, as a proper act of courtesy to Andrew Clerk, Esq., that the dinner at Sutherland's was given by his invitation.—ED.]

—A private letter from an officer of the Massachusetts Anglers' Association, dated, April 28th, says the Smelt Law works like a charm with the Boston fish dealers. Not one is to be found in all the markets. The dealers not only stand in awe of the fine, but most of them heartily approve of the law, and will support it. No attention is paid to orders. A Rockland fish merchant sent an invoice of smelts to Shattuck & Jones, Boston, telling them "he could supply Boston," and asking for returns. He received returns in the shape of a circular from the Massachusetts Anglers' Association quoting the law "that whoever offers for sale, or has in his possession any smelts between March 15th and June 1st., shall be fined \$1 for each smelt."

The Lobster bill goes into effect the 1st of May, but even now they are much larger than they were a short time ago.

PHILADELPHIA, April 25th, 1875.
EDITOR FOREST AND STREAM:—

In reply to your Philadelphia correspondent, A. M. S., I would state that the technical name of the ordinary chub or fall fish alluded to by him, is *Leucosomus rhothus*. It is one of the carp family. Beside taking a white grub, they will rise readily to a fly in clear water late in the afternoon. I have taken them thus in the Brandywine, and in the upper part of the Fishkill and on the Beaverkill, in the State of New York. On the latter stream, in olden times, they were considered a nuisance when fishing for trout, (vide "American Angler's Book," and "Bethune's edition of Walton.") In New York State they are known as wind fish, sometimes as dace. THAD. NORRIS.

IDENTIFICATION OF THE MICHIGAN GRAYLING.

Here is a chapter of history relating to the Michigan grayling, for which we are indebted to our constant friend Seth Green:—

BATTLE CREEK, Mich., March 31, 1874.
SETH GREEN, Esq.:
MY DEAR SIR—I am sorry you gave me credit for naming the grayling. That honor belongs to Dr. F. C. Parker, of Grand Rapids, Mich. A letter was written to Lieut. Theodore Gill, of Philadelphia, years ago, describing minutely this fish, and asking the privilege of giving it that name should it prove, as the Dr. thought, to be new. To that letter no reply was ever received, but some one described the fish in "Chambers' Encyclopedia," giving the name as *Thymallus tricolor*, it is supposed, from three colors of the dorsal fin. I believe that the Dr. (Parker) was the first to determine the character of this fish as of the sub-salmon family, called *Thymallus*, as above, and that the description given in Chambers' work was from Parker's letter; perhaps not. You have perhaps given the average of these fish as to size, but specimens grow to 16 and 18 inches in length. My impression is that we have a true trout here, differing greatly from any that you have, but of that we will know more when you come out, as they are found in streams near the habitat of the grayling. Before Dr. Parker determined the character of the latter they were called by as many different names as there were localities in which they were found—"Hersey trout," "Muskegon fish," "Swift," "Manistee shiner," &c., &c., &c. I am, sir, very truly, MARTIN METCALF.

Heretofore the credit of identifying the grayling has generally been assigned to Prof. Cope, of Philadelphia, and to avoid committing an error in statement, we addressed a letter on the subject to Prof. Cope, and elicited the following reply:—

PHILADELPHIA, April 24, 1874.
EDITOR FOREST AND STREAM:—
I have your note respecting *Thymallus tricolor*, the Michigan grayling, with Seth Green's letter accompanying. I would reply that I had not heard of Dr. Parker, of Grand Rapids, previous to reading Mr. Green's letter, nor am I aware that he has published anything on the subject of the grayling. I was a partial editor of the latest edition of Chambers' Encyclopedia (by J. B. Lippincott, 1870-72) in the Natural Science department, and inserted a short notice of this fish, which I described in 1864-5. I have no older edition by me, but think Mr. Green will find that there is no notice of *Thymallus tricolor* to be found in any of them. I would note that Hayden found this fish abundant in the heads of the Missouri (See Am. Report, U. S. Geo. Surv. 1870), and the Smithsonian Institute has it from the northwest coast waters. It still remains to make a thorough comparison with authentic specimens of *T. signifer* of Richardson from British America, as American ichthyologists are not yet acquainted with it. Yours truly, EDWARD D. COPE.

TROUT CULTURE ON LONG ISLAND.

BROOKLYN, April 24, 1874.
EDITOR FOREST AND STREAM:—
Having taken a great interest for the last few years in artificial fish culture, and read many glowing accounts of the number of trout hatched and the small percentage of loss, I expected before this to have seen our markets stocked with the speckled beauties. As it is not the case, I made up my mind fish culture was a failure, until being in market a few days since I saw some exposed for sale, of which I bought some (and never saw finer), and was told that they came from Ingham Spring, Newhope, Pa., and hearing such a splendid report of the Spring, I paid it a visit, and I now say fish culture, in proper hands, is no failure. I belong to a club on Long Island, where trout are not plenty, and I wish Recorder Hackett, who is president of one of our best clubs, and others who are interested in fishing on Long Island, before Mr. T. markets his fish would pay him a visit to Ingham Spring, and see if Long Island cannot be stocked with trout and salmon the same as Mr. Thompson is doing for a club there, which, in a short time, is destined to be the most successful club for fishing in this or any other country. It is the only place I ever visited where you can see large quantities of fish. They all had them, but were down yonder out of sight. If you visit Mr. Thompson you will find he knows Long Island can throw a fly, and is an amateur

who, I think, understands fish culture and can see how easily thousands of salmon and trout can be propagated, of which Mr. T. has both, from three years old down to fifteen days. Yours truly, I. Q. J.

—The Manchester, (N. Hampshire) *Mirror* says that previous to the building of the dam at Lawrence both shad and salmon were quite plenty during May and June in the river, and though they were fished in all sorts of ways, with seines, nets and spears, the supply gave few indications of being exhausted. The year before the completion of the Lawrence dam were caught around the falls over fifty salmon, the largest of which weighed twenty-four and a half pounds. The price then was about twenty-five cents per pound. Since that year no shad, salmon or lamper eels have appeared there except now and then a stray one which has been thrown over the dam by fishermen from below. There is a fish-way at Lawrence, but it is useless, being built so that it opens into the river several rods below the dam, and where no fish will ever find it.

Mr. Kidder, superintendent of canals and locks at Amoskeag Falls, who is an old fisherman, believes that when fish are ascending a river and meet with a dam they run back and forth the entire width of the river, and then if they find no break in the dam, fall back and lie in the eddy which is always formed just below where the water strikes after falling over the dam. The outlet of a fish-way should therefore be in this eddy and where the fish will feel the stream pouring out of it. When thus made and supplied with a proper volume of water and with steps a sufficient distance apart to make the turns gradual, fish will have no difficulty in ascending them. The fish-way here is much better than the one at Lawrence, though this might be much improved by making it larger and changing its outlet. It is of little consequence, however, what we have here until those at Lowell and Lawrence are so improved that fish can reach this place.

Mr. Kidder has an idea that the fishways in Massachusetts have been built upon theories instead of actual knowledge of the habits of fish, and will be useless until remodeled, which he is confident they might be so as to give us back the treasures we have lost.

Woodland, Lawn and Garden.

SMALL GARDENS IN CITIES.

"A harbor of delight
For wren and redbreast, where they sit and sing
Their slender ditties when the trees are bare."

IN our last paper, at the request of several lady friends, we spoke of a limited extent of ground which was to be improved as a small city garden. We spoke of it as being of simple principles and of circumscribed dimensions, and we told our lady friends how they could make the most of what they had.

Since writing the plans and directions for a "small city garden," we have received several letters of inquiry from our lady friends relative to going one step further, of obtaining a little more show, and one lady says—"After the summer flowers are gone, all looks so dry, bare, and unpleasant, and I want you to tell me if I cannot add something to my summer garden to make it cheerful in the fall."

These are just the inquiries we like, and they will always be answered with pleasure through the FOREST AND STREAM. As your space is of greater or less extent in front or by the side of your dwelling, so you are to lay out the same, either in the simple, serene taste, or style, or in the more elaborate and fanciful. Some persons may be found in every large city who will say that to obtain any good effects under such disadvantages of location is an impossibility in small city gardens. The mistake lies not in the city, but in the citizens themselves. We often find ourselves compelled to stop by the way and correct just such errors of opinion. Gardening may have to be carried on under adverse circumstances. It frequently is; yet why should any sensible man entertain an opinion so absurd. The subject may, with a very few, lose its interest. They may say that it will not pay; and then, their ground is so small that they cannot make anything pretty or elegant out of it. This is not a good excuse for not cultivating flowers. You have, you say, only two square rods of green sward in your front yard; not large enough for anything. Two years ago just that remark was made to me by a lady in Massachusetts. She was quite intelligent upon most subjects, but unfortunately her success was not perfect in raising even a few flowers. Said she:—"Pray tell me what to do with this little pocket handkerchief piece of green?" Turn it to account, was our answer; why should even the smallest courtyard be suffered to run to waste, become a nuisance, an eyesore, and not a thing of beauty and joy? Turn it to the best account. What if it is small; a little thing is a mere trifle; but many little things, many trifles, make in the end no trifle.

Our opinion is strengthened every day in the belief that no open space is so insignificant as to be susceptible of no improvement. What a new creation comes over the face of this old familiar courtyard by the addition of a green tree, a few shrubs, and some bright flowers to ornament and give life to it. Why, the very birds gratefully recognize this new creation by singing their sweet *te deum* within their branches. Away with such unbelief. Go into your cozy parlor, look out of your gorgeous bay window, behold God's sunshine, look at the green trees, the shrubs, and the plants, and listen to the sweet birdsong; and if you know of one poor soul, sitting in the dense shade of poverty and want, shake one scale from your drowsy soul, bestow upon him one single copper, and if you cannot do

this give him or her, in the name of your great Master, a little sunshine, a single sweet word. If you cannot do this God help you; you do not love flowers.

But we speak for the benefit and instruction of such as do love flowers, and to them we love to talk, and for such the FOREST AND STREAM makes its weekly chit chat upon the beautiful things of earth. Why should the back drawing rooms of so many city mansions, we ask, look out upon dirty walls and dirtier pavements? Why such a starved, aching void, as it were, of life, of beauty, and of sweetness? Under the baneful influences of the densest London fogs turf grows. There is a greenness seen, an influence felt, struggling up for life amid all this smoke and under circumstances the most adverse. Why not cover all that old decayed window with a lattice work of green ivy? It costs only an hour of labor, a few pence, a couple of ivy plants placed upon a little shelf, and you have let in a whole flood of sunshine upon these dismal surroundings.

In this connection of screens for unsightly objects which you cannot remove, we will add that the nasturtium will soon cover a large space with its bright green leaves and its golden and scarlet blossoms. We have often used it, commingled with the dark green leaves of the Russian ivy, in preference to any other plant. Here are two plants that may be reliably used as screen plants when many others fail. To these you may add the *tropaeolum* and *canariensis*. Occasionally watered, these plants give satisfaction.

To return to our courtyard again, we find we have two rods square only, and our lady friends are troubled with green grass and no variety; so in order to diversify this plot we cut from the centre a circle of five feet diameter, and carefully removed the sods and made the soil fit for the reception of plants. Ascertaining that with a very little pains an abundance of water could be introduced, I gave to my small circle a somewhat sub-tropical arrangement of plants. I placed near the centre three large sized canna plants, and near the outer edge three large sized plants of the castor bean, and four large sized plants of the *calladium esculentum*. These, and a few zonal geraniums interspersed, were all that were used in this collection, and the effect of the same was exceedingly fine. This may be considered as one of the simpler forms to be used in garden courts where but little ground is to be had, and the principal object desired is the placing of a pleasant object before a bay window. There is quite a variety of objects that are pleasing and appropriate for such situations, all of which admit of beautiful and artistic illustrations, and even classic allusions may sometimes with propriety be introduced. The vase upon a pedestal, when filled with appropriate plants, is a very fine ornament for a small court, and when well cared for by the mistress of the mansion will relieve the tedious hours of ennui. This kind of ornament, however, requires considerable taste as regards the proper kinds of flowers to be placed within the vase, and also some knowledge of the particular kind of attention they require afterwards.

As before observed, this was a sub-tropical garden, the dimensions of which, you will notice, can be much improved upon both by the introduction of a large number of plants and the enlargement of the garden plot.

Among other plants that can be judiciously introduced in such situations we suggest Japanese maize, *Tritoma*, *Yucca filimentosa*, and *Ricinus communis*. The castor oil been is a very luxuriant, hardy grower, and I always use it sub-tropically. The *R. sanguineus* is quite picturesque. If you require plants for groups you will find that a selection from the following will afford you a good study as to taste and cheapness—begonias, ferns of the different kinds, *Lycopodia*, *Amaryllis*, *Eucharis*, *Peperomias*, *Ficus elastica*, *Bambusa*, etc. These are some of the plants you may venture to use with a good degree of success. The following seeds may now be sown within your hotbed frame, as they will soon come up, and make a portion of your garden stock of plants. New tri-color geraniums, dianthus, heddewegii, balsam, rose flowered; aster, large flowered; victoria, heliotrope varieties; mignonette, nigella, panza, new variety; petunia, double variety; stock royal gem, verbenia hybridii, whillava grandiflora, tropaeum, hollyhock, mesembra anthemum, clyanthus, coix lachryma, zinnia, and sweet pear. These are all very fine growing seeds, and any or all of the twenty varieties can be obtained for a trifle by those who would like to experiment with the same. In our next we shall answer question second.

OLLIPOD QUILL.

—Aphis, or lice on house plants, may be destroyed by enveloping the plant in a cone or form of paper, and then filling the cavity with tobacco smoke, after which they should be thoroughly syringed with clean water, the plants in pots being laid on their side so that the aphis may be washed away, and not on to the soil, whence they would again crawl on the plant.

Various plants and trees have their peculiar slug or false caterpillar, the larvæ of various saw flies. Those infesting your roses are probably *Selandria roseæ*. Wash the plants with carbolic soap, or whale oil soap suds, and afterward thoroughly rinse with clean water, unless you prefer to pick them by hand.

If you cannot get these soaps, use ordinary soap suds, to which add one part in seventy or eighty of carbolic crystals dissolved in spirits of wine, cleansing with pure water afterwards. What remains of the liquid may be used for washing the walls and roosts of your poultry house, or other places apt to be infested with lice.—*Western Rural*.

—Scaly legs on fowls, which are confined in close, damp quarters, can be cured, it is said, by removing them to clean, dry yards, and by one or more applications of an equal mixture of turpentine and sweet oil. Lard and sulphur are also recommended.

The Kennel.

DOGS AND THE KENNEL CLUB.

Herewith will be found appended an exceedingly interesting and characteristic letter from the Rev. J. C. Macdonald, of Cheadle Rectory, England, who, it will be remembered, was one of the prime movers in the International Pointer and Setter Challenge, wherein he gives an account of when the dog was first introduced to polite society in England, and with what intense disgust the best people of Great Britain looked on a man who bred dogs for pleasure or profit. All this has been changed now, for on looking over the list of the Kennel Club members we find the best respected names in England.

In our country there still exists a semblance of unpleasant notoriety for those gentlemen who own or breed dogs for amusement and instruction, but we are glad to state this is fast dying out, and the more the subject of improvement in the breed of these animals is agitated and explained in its proper light, the more general it will become, and as we have stated before, we predict that in a very few years Dog Field Trials will become as popular as any other outdoor pastimes. Mr. Macdonald states that he has shipped to Dr. Rowe, of Brooklyn, the brace of thoroughbred dogs that the Doctor ordered through us, and we trust they will turn out as splendid animals as they are in breed and form.

HILBRE HOUSE, WEST KIRBY,
BIRKENHEAD, England.

EDITOR FOREST AND STREAM:—

I promised to send you occasionally some notes of our doings in the dog world. It is perfectly marvelous, the change that has come over public opinion in England with respect to dogs, within the last few years (in fact since the establishment of the first dog show, held in Newcastle about twenty years ago). Before then to openly profess a fondness for dogs, or to be called a "dog fancier," was enough to ostracise one in polite society. The "fancy" then comprised the "Bill Sykes" *et hoc genus omne* type of the community. Now we find the largest supporters of our canine friends are among the wealthiest and most aristocratic nobles of our land, even ascending to royalty itself. At the great Scotch Dog Show, held last January at Aberdeen, near Balmoral Castle, the Highland home of our beloved Queen, we find her Majesty winning first and second prizes with a pair of grand stag hounds. Next month, at another large Dog Show held at Kings Lynn, near to Sandringham, the Norfolk home of our popular Prince of Wales and our dear Princess, we find them both large exhibitors, and vying with each other to see which can evince the greatest interest in the welfare of our different breeds of dogs. The Princess, however, won the day, taking the two first prizes ahead of the Prince, having won first prize with a grand young Mount St. Bernard dog I had the honor of presenting to her about two years ago. She also won a massive gold locket I presented to the Dog Show to be competed for by the ladies of the county of Norfolk, and presented it to her at Marlborough House, after attending the levee in London last week.

The Kennel Club, established by Mr. Shirley, M. P., M. Murchison, F. R. G. S., and myself has also tended to give a great impetus to the interests of the dog world. I enclose you a list of its rules and members, and have appointed Mr. Howe our secretary. Mr. Howe has for many years been known as one of our most enthusiastic sportsmen and advocates for field trials and dog shows. His letter, under the *non de plume* of our "Country Correspondent" and "Leatherhead" in *Bell's Life*, I have no doubt, made his thoughts and ideas on sporting matters familiar to many on your side of the water. The Kennel Club is to be congratulated upon having for its secretary so accomplished a gentleman and thorough sportsman. It is whispered that the Prince of Wales is about to join the Kennel Club. I think it might be a good plan if we might, from time to time, enroll amongst our members some of your leading sportsmen, so as to keep up and foster the genial sympathy that exists between our two great countries. I am sure any American gentleman calling at the Kennel Club, seeking information upon shooting matters, coming with a recommendation from you, will be sure to meet with a courteous reception from Mr. Howe. I have sent to the Kennel Club my collection of stuffed dogs, comprising a series of departed worthies, including "Tell," my great champion St. Bernard dog, winner of so many first prizes, the only dog that never was beaten, and one that I was offered £400 for; also "Gessler," his great rival; amongst pointers, the champions "Marquis" and "Miranda" amongst skyes, "Rook" and "Pearl" fairest and loveliest of their kind—all of these dogs great in their day. I have this very day sent off by the Allen line of steamers from Liverpool, two splendid setter bitches to Dr. Rowe, of Brooklyn, N. Y., one red setter bitch "Banshee," by my Mozart out of Min; Mozart by my field and show winner Plunkett, that I sold to Mr. Purcell Llewellyn for £150 and offered him £200 to let me have him back again a year after. The other bitch is out of Venus, own sister to Judy, the dam of the wonderful setter Ranger. Venus is a pup to Ranger; from this progeny some extraordinary dogs ought to result.

I must ask you to allow me, through you to thank the many American gentlemen who have inundated me with so many kind letters, offering me hospitality, shooting and sport of different kinds, should I visit your country. The letters are too numerous to answer in detail, and I trust they will kindly accept this acknowledgment of my sincerest thanks.

J. CUMMING MACDONALD.

—We are in receipt by this mail of the following from the Rector of Cheadle, near Manchester, England: "In my letter to you yesterday for publication I stated I sent two dogs to Dr. Rowe, of Brooklyn, N. Y., will you kindly alter this a little and print it?" Mr. G. Macdonald, who recently purchased my kennel of dogs, sends this day per Guion steamer two setters, Banshee and Kirby, and that he has just received a commission to forward two St. Bernard pups to Brigham Young, of Salt Lake City.

PEDIGREE OF BANSHEE.

BANSHEE*

Mozart.		Brosna	
Plunkett.	Min.	Watson	Irish setter; Rollo
Grouse.	Beanty.	Bob.	by a dog of Lord Besborough's out of Stella by York, owned by Messrs. Leveridge of Beggar's Bush, near Dublin of Dyer's red Irish setter Dan.

*Blood-red Irish setter, 40 months old.

PEDIGREE OF KIRBY.

Kirby very handsome white, black and tan setter, eighteen months old; Don, Venus' own sister to Judy, dam of the great Ranger; Don by Mr. Laverack's Dash, out of Lord Dound's Duchess.

"Mohawk" writes us and states, "Banshee and Kirby arrived April 22d in the steamer Wisconsin. Kirby whelped on the voyage and all of them died. Is it not hard luck for me and to sportsmen in general? Macdonald, I think, is much to blame in sending her out when he knew she would whelp so soon?"

LAVERACK'S APOLOGY.

BROUGHALL COTTAGE,
SHROPSHIRE, ENG., April 16th, 1874.

EDITOR FOREST AND STREAM:—

You will please insert in your next issue that it escaped my memory when I said I had never sent any dog to America. Two years ago, in England, I did sell a puppy to Dr. Gautier, whom I believe is an American. She was a bitch, five or six months old. This puppy escaped my memory. With this exception, I am positive I never sent or sold any dog, bitch, or puppy to America. This puppy was sold in England, and not sent by me direct to America, and is the only one ever sold by me to any American.

Yours, truly,

E. LAVERACK.

Mr. Laverack requests us to state that now, as we have sold all the dogs and bitches he is willing to dispose of to America, "you had better give intimation that I shall have no dogs at present for sale, as I only breed and sell puppies; of these I have only one or two pairs to dispose of, as Mr. Price and other gentlemen have bespoken all the remainder."

TO STEAMSHIP COMPANIES.—It appears there is a great deal of unnecessary trouble, extra labor and expense in transporting thoroughbred dogs from England to America. Would it not be as well to make one distinct tariff for all classes of dogs which should include lodging, care and food? The butcher of the ship would only be too glad to give a little attention to the animals, and we feel assured that gentlemen on this side of the water who are importing expensive dogs would be pleased to pay a little extra to the man delivering the animal. We are induced to make this suggestion to the various steamship lines as we are weekly receiving letters from our correspondents abroad complaining of this matter. Idstone says, "I have dogs now in my kennel awaiting transit. Great difficulties are thrown in the way of passage by the various companies. I wish you would use your influence to get them removed. I can send any number of dogs to any part of the world but the United States without any trouble."

ON KENNELING AND FEEDING DOGS.

NUMBER THREE.

THE remaining portion of this interesting letter to *Bell's Life*, by a correspondent signing himself "Old Calabar" we publish as follows:—

"Spratt's biscuits are excellent food, but as there is a large per centage of meat in them they must be used with care; they are given dry, but it is a very good plan once a week to boil them, chopping up greens small, with turnips and parsnips, &c. All dogs require a little well-boiled green food during the summer months to keep them in health; fresh tallow greaves may be used in flavoring the meal, but I prefer panaches or anything else if I can get it. In the Highlands of Scotland you cannot always procure fresh meat for your dogs, and you will then find greaves very useful. As I have said, Spratt's biscuits are excellent food; they are well made, do not take up much room, and are always procurable. I consider them a most valuable invention. Setters or pointers should have a little given them before going out, but if you do not like this plan they may be fed overnight. Your man can always take a biscuit or two in his pocket, and give them a few bits when you take your luncheon. Dogs, like horses, when allowed to get in poor condition, take a long time to get up again; their coats are ragged and dull, and this will not change for the better till they slip them. Some dogs eat much more greedily than others, or will not allow others to feed with them; they should always be watched whilst they are eating; let the slow or timid eaters go to work first, and then let the others on. If you have a quarrelsome dog at his food feed him by himself. It is a mistake having a dog too gross or fat, it brings on fits, mange, and sometimes fatal diseases; this is where you must use your discretion. A dog should be in nice hard condition, not hide bound, with a good loose skin, but not too fat. You should change a dog's food occasionally. In winter time mix a little barley meal with the oatmeal; you may then ring the change with Indian meal, or Spratt's biscuits. Rice occasionally is very good. You must study your dogs' appetites as you would your own, and the food you give them should be perfectly clean and of the best; occasionally you may mix a little flour of sulphur with it. Very judicious feeding is necessary if you are going to exhibit. Many exhibitors three weeks before a show put flour or other things in their dogs' food, the object being to send them in the finest possible coat and condition. You must never allow you dogs to be stained or dirty in their coats or skin; an occasional washing is necessary; but if they are well kept, well bedded, well and judiciously fed, they will not require much of this. If a dog shows the slightest touch of heat or mange, attend to him at once; it is very easily checked. Dalziel's mange lotion is very good. I always use Liquor Calcii Persulphureti, diluted from one to four times or more parts of water, as the case may require. This with a little opening medicine soon puts them all right. The medicines I use are few and simple, but as every one has his ideas on this subject I will say nothing about it. There is one thing I had almost forgotten: Your kennels should be deodorised with Condy's or other disinfectants; there are many advertised, and, I believe, good. After all, perhaps, to name a few medicines may not be out of the way. For fresh cuts or wounds I use tincture of benzoin, *i. e.*, friars' balsam, and for wounds that are disinclined to heal, carbolic acid and glycerine; castor oil or powdered jalap for a purgative; arica nut for worms, with a dose of castor oil to follow; white precipitate for ticks or lice; tincture of arnica for bruises or strains. But the better way for those who do not understand medicines is to get some book on the subject. When I wash my dogs for the purpose of killing vermin I use a little carbolic acid, but this you must be very careful of. McDougal's patent carbolic soft soap is very good and safe. If I merely wash my dog to give a clean and bright coat I use the following once a week:—Lime water and linseed oil equal parts (one quart,) 1oz. carbonate of soda. Leave it on the dog three days, and then wash off with soft soap and hot water. This is a very old recipe and, if I mistake not, one of Colonel Hawker's; but I really

quite forget—at any rate it is good. If your dog comes home with his flag or feathers encrusted with clay, do not allow it to dry on, but remove it with hot water. I have very frequently had my dogs in such a mess on coming home after a hard day that I have given them a warm bath before feeding to remove the stains and dirt. Rub them well after, and let them come before your fire if you have one, and when dry feed them and shut up for the night; but unless your dogs are in a very filthy mess they do not require this washing. On my return from shooting I always feed my dogs myself; in fact, I always do so when I am at home. Your dogs have worked all day for your pleasure, and they should be fed before you feed yourself. After seeing them all comfortable you can then take your own bath and make yourself so, first cleaning your gun, or giving it to be done by one you can trust. You have then no cares for the rest of the evening. I forgot to mention it in its proper place—there must be no draft whatever in your kennel, which should be thoroughly warm, dry, and snug. If dog owners attend to the few simple instructions I have given I am certain they will see their animals thriving and in good order, and a credit to them. Nothing is so wretched to look at as a poor, miserable, tucked-up, half-starved, mangy animal. Perhaps this is not the place to name it, but I always allow my setters to retrieve their own game in the open, but never in cover; on partridges I always indulge them. They have found the game for you, and I think it is only fair to let them have the pleasure of retrieving it. I had one setter who was the most remarkable retriever on snipe I ever saw. Later I may give my views on the breaking of pointers and setters; but this has already been done in such an exhaustive manner by Colonel Hutcheson and others that I am almost afraid to attempt it."

CINCINNATI, April 25, 1874.

EDITOR FOREST AND STREAM:—

I think galvanism would, as you say, be a good thing for "S.'s" dog Shot. Perhaps he may be troubled with incipient cancer in the ear; although "S." examined him, the disease may be in its infancy and "S." deceived. If the dog is by this time in the same state it will be apparent; if so, "S." should send Shot to a student on canine pathology. W. L.

National Pastimes.

Will our University correspondents kindly send us their most recent catalogues.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

—The Young America Cricket Club, of Philadelphia, at a recent meeting, elected the following officers for the ensuing year:—President, E. M. Davis, Jr.; Vice President, Charles A. Newhall; Treasurer, Sydney L. Wright; Secretary, Charles E. Morgan.

—The Germantown Cricket Club, who sent a member to visit England to make arrangements for an English eleven to visit Philadelphia this year, states that there is a strong probability that a first class eleven will arrive in September next under the captaincy of Mr. V. E. Walker.

—The St. Louis cricket club were out for practice for the first time this season on April 24th, when the Benedicts polished off the Bachelors, with six wickets to fall. Sharp's total of thirty-eight "not out," was the batting feature on the one side, Jeffries leading on the other.

—The Philadelphia club will play their first match Saturday, May 2d. Their adversaries will be the Germantown Eleven.

—The Philadelphia professional club had an unprofitable trip of it on their first eastern tour, which was commenced April 24th, as the snow storm which prevailed over New England the 25th and 26th put a stop to their games in Boston and Hartford, and the rain of Tuesday rendered it impossible to play their games with the Atlantics and Mutuals, in Brooklyn, on the 29th and 30th, so all the expense of the trip—nearly \$400—was incurred for nothing. This comes of not studying "Old Prob." properly. Had they done so they would not have left New York on Friday night.

—The Chicago club visited St. Louis on April 20th to get into practice in games with the St. Louis amateur clubs. They opened play on the 21st in a match with the Empire club nine, whom they defeated by a score of 24 to 2. On the 22d they met the amateur "Red Stocking" nine, and the latter apparently did credit to the color of their hose, for the Whites of Chicago failed to score a single run until the sixth inning, when they got in four runs. They did not get another until the ninth, when they added two more to their score, the "Reds" fielding very prettily. The St. Louis players, however, were sent to "Chicago," as they were not allowed to score a run.

—The amateurs of New York and adjoining States met in convention again in this city on April 22d, an increased attendance of delegates showing that a growing interest is being taken in the renewal of the old Amateur National Association. The promise is that the next December convention will be more like the old time meetings of the National Association than have been seen for ten years past. No official report of the proceedings have been sent in. The committee of rules mistakingly ignored the rule of calling wide balls on all balls pitched out of possible reach of the bat. This, and their rule of calling balls, admits of the wildest delivery by amateur pitchers, with the practical result of large scores and long and tedious games.

—The Pennsylvania amateur association will play under the new code of rules, as also the Maryland and Louisiana associations. The Knickerbocker and Excelsior clubs—two of the oldest clubs in the amateur fraternity—have not entered the amateur association. They should be represented next December.

—The ball grounds of Prospect Park have been newly laid out, and the Park Commissioners have made every preparation to accommodate the best class of amateur

clubs with playing facilities, for which the clubs owe thanks to Chief Engineer Culyer.

—The Montague club, of Brooklyn, has been getting into good training by playing with the professional nines of the Mutuals and Atlantic clubs. They get beaten, to be sure, but they learn the new points by it. They wear a new uniform of the old amateur pattern.

—The Chelseas—the champions of 1873 of this vicinity—met with a signal defeat at the hands of the Mutuals on April 27th, at the Capitoline grounds, the professionals sending them to Chicago by a score of 26 to 0. Matthews, supported as he was, was too much for the boys from the "burg."

—The Washingtons, of Brooklyn, had a game with the Atlantics April 24th, ending with a score of 26 to 9 in favor of the professionals.

—The new nine from Essex, N. J., and vicinity, composed of the old Resolute and Irvington, played a game with the Atlantics at the Capitoline grounds on April 27th, just to test their strength, and they ended the contest with a score of 26 to 9, the Atlantics, of course, winning.

—The Boston club nine were sorely disappointed at not being to be able to play the Philadelphians on Saturday. They were all hungry for a game, and had the weather been fair they would have made it warm for the "Pearls." The morale of the champions is excellent, and the reason is that their backers and the club stockholders are among the most influential of the Boston commercial men. It is beyond doubt a model professional club.

—Mr. Andrew Rennie, of the New York Caledonian Club, well known as one of our best athletics, having challenged any man in the club to run 100 yards, Mr. Rennie allowing six yards start; the same has been accepted by Mr. John Ross, of Manchester, whose achievements in the old country have rendered him quite famous. The match will take place on the 22d of May.

The Horse and the Course.

—Through our consul at Manchester, C. H. Cranscombe, Esq., General Alexander Schaler has been informed that an exhibition will be held in Manchester on the 12th and 13th of May, of horses, with the particular end in view of having animals proper for the breeding of cavalry horses. This movement owes its origin to the fact of the difficulty found in England of having sufficient horses fit for cavalry duty, which statement has been before brought to the notice of our readers. The exhibition will be conducted under the Presidency of the Earl of Derby. It is a matter of regret that notice of such an exhibition was sent so late to the United States, and it is a matter of doubt whether our raisers of animals, fitted for cavalry use will have time to send their best horses to England.

—The Baltimore *American* says that the secretary of the Maryland Jockey Club has received advices that a number of noted Tennessee stables will arrive in Baltimore shortly and take part in the spring meeting at Pimlico, which begins May 26th and continues four days. There will be sixteen races at the coming meeting. A two mile dash for all ages; the celebrated Preakness stakes for three year olds, distance 1½ miles; a mile heat handicap for four year olds, and mile and a half trial steeple chase for horses of all ages that have never won a steeple chase at Saratoga, Jerome Park, Long Branch or Baltimore, constitute the programme for the first day. Of these races the Preakness stakes are the most important, as the winner will receive nearly \$2,200. There are eighteen nominations for the handicap race, among which are such horses as Catesby, Lizzie Lucas, Diavolo, Artist, Cariboo, Mart Jordan, Survivor, and Satire. Survivor is handicapped at the head, he carrying 112 pounds. The light weights are Sallie Watson, Jack of Trumps, and Fannie Boston, who are handicapped at 95 pounds each. The concluding race on the first day will be a trial steeple chase, over 1½ miles of regular steeple chase track. The second day of the meeting will be opened by a single mile dash, for all ages. The second race will be the Chesapeake stakes, for fillies, three years old; a single dash of 1½ miles. There are nine very promising fillies entered for this. The third is a selling race, mile heats, for all ages. The day's sport will be concluded by a free handicap race of 2½ miles, open to all ages. A three quarter mile dash, for maidens of all ages, a single dash of 1½ miles, gentlemen's post stake, and open to all ages. A grand sweepstake race for three year olds over one mile, and a two mile heat for all ages, constitute the programme for the third day. On the last day of the meeting there will be a selling race for three year olds, 1½ miles; a two mile handicap race for all horses that have taken part in the meeting; a compensation race, mile heats, for horses that have not started during the meeting, and the grand steeple chase post stakes over the regular steeple course will conclude the meeting. The managers have also increased the stakes for this meeting, and they will now aggregate to over \$10,000.

DETROIT, April 22, 1874.

EDITOR FOREST AND STREAM:—

I enclose notice of burning of our club house on the 19th inst., as it may interest you:

"Early on Sunday morning the large and elegant club house at the flats belonging to the North Channel Family Fishing and Shooting Club was burned to the ground, with all its contents. At the time of the disaster the building was occupied by four or five members of the club, together with the keeper. The inmates were all in bed, some of whom had not time to secure all of their clothing before the structure was a mass of flame. All were but too glad to escape with their lives. The flames were communicated to the boat-house, also used for an ice-house and barn, which was also destroyed, together with a large sail boat, with a capacity of 30 or 40 barrels, belonging to the keeper. The furniture of the club house was very valuable. There is no insurance upon any of the property. The club house was a commodious structure of 30x40 feet, having two stories and an attic."

Duck shooting has been very good this spring; in fact, is now very good. Several members of our club—the Audubon—have killed 50 to 60 a day several times lately. The birds are mostly red necks and black necks, with a sprinkling of canvas-backs and blue-bills. Snipe are just coming in.

GROVER ISLE.

THE "MISSOURI OF THE NORTH."—The Yukon runs the entire width of Alaska. Its head-waters are in British territory, but for a distance of say 1,000 miles, it flows through Alaska soil. The confluence of the Lewis and Pelly Rivers forms the Yukon, and from the point of junction (Fort Selkirk) to the Kusilvak mouth, on Behring Sea, the distance is about 1,300 miles. To the true source of the Yukon, Lake Kennicott, the head of the west fork of the Tahco, the distance from Fort Simpson is some 600 miles. This gives a total of 1,800 miles; and this is believed to be under rather than over the mark; taking in the curves it is safe to call it 2,000. Several navigable rivers are among the tributaries of the Yukon; and it is worthy of mention that the northern affluents of the Stikine (the mouth of which is in lat. 56 40, are separated by only a narrow portage from the southern affluents of the Tahco, so that at certain seasons one might journey by boat from Wrangell, in southern Alaska, to the mouth of the Yukon, by making two short portages. The distance would be about 2,300 miles. Or, leaving the Yukon at Fort Yukon, the traveler might ascend the Porcupine 150 miles, to Lapierre, and thence make a portage of sixty-five miles to Fort McPherson, on Peel's River; thence he would proceed by boat to the great rival stream of the North, the McKenzie, and on to the Arctic. The Yukon is navigable a distance of 1,000 miles, for steamers. Its width in some places is twenty miles, and in some others, on the Lower Yukon, is so great that one bank is invisible from the other. Boat navigation opens about the 20th of May and closes usually in October, though the season varies locally.

THE CODFISH.—ITS VALUE AS FOOD.—HOW THE GRAND BANK WAS FORMED.—What a marvelous influence upon civilization and human progress the humble but nutritious codfish has had. He has been a mine of wealth to a vast population. It seems as though good Mother Nature, foreseeing the needs of humanity, had made special preparations for a good supply of this very necessary article of food for body and brain. She floated her icebergs, which were filled with the sandy bottom of northern seas, down to the Gulf Stream, where they melted and, depositing their debris, formed the Grand Bank of Newfoundland. It was the work, the slow and toilsome work, of ages. Every Spring, thousands of these bergs, one-third above water and two-thirds below, the upper part clear, sparkling, and translucent, reflecting the sunshine, and giving it back to the enraptured eye with that prodigality and brilliancy of coloring which only nature can afford, the lower part mixed with the coast bottom of Greenland or Labrador to the extent of thousands of cart-loads, came floating down majestically through Davis' Strait, and meeting the warm air and warm water of the Gulf Stream, melted and deposited their contribution, until at last those immense shoals were formed where the cod and haddock swarm. And it is said that these sand banks have huge depressions, like vast valleys, which serve as aquaria, and that when a fishing vessel is lucky enough to anchor over one of them, it can fill its hold and deck with as many as it can carry.—*Gloucester Telegraph*.

—A Nevada correspondent of the *Germantown Telegraph* writes from Elko, Nevada, as follows:—

About eighty miles north of this place, on the north slope of Bull Run Mountain, which never loses its massive banks of snow, rises a small stream, formed by springs that furnish the purest and coldest water I ever drank. The stream, after running a distance of half a mile, is about two feet deep and about six feet wide on an average; at this point a succession of hot springs rise on the banks, and flow into the stream, increasing the volume of water about one third. The water of the spring is so intensely hot that less than three seconds are consumed in boiling eggs in it. The creek above and below this point swarms with fine brook trout; and, strange as it may appear, to persons standing on the banks where the hot water is discharged into the brook, and looking through the rising vapor, you can see hundreds of fish swarming to and fro in the boiling element with as much indifference as though there were no hot water near.

This latter, if unaccompanied by an explanation, would undoubtedly pass for a Nevada fish story; but to satisfy the incredulous I will give the result of my investigation, it being July when I visited the place. I took a common thermometer with me which only registered to 130 deg. Fahrenheit. A test of the water above the hot springs showed a mean temperature of 42 deg.; fastening my thermometer to a pole I immersed it above the influx of hot water, and keeping it as near the bottom as possible, I moved it gradually down stream. The result was a very low temperature at the bottom, gradually rising to 65 deg., until I reached a point (a fourth of a mile down the stream) where the temperature became uniform throughout. This it will be seen shows that the hot water, having a specific gravity much less than the cold, retains its place on the surface, forming an upper intensely hot stratum, and leaving the lower water with its finny tribe undisturbed, and to all appearances swimming to and fro in one of Nature's cauldrons.

The stream is one of the many that form the headwaters of the Columbia River, and to this point, over eighteen hundred miles from its mouth, in the spring and fall, the salt water salmon come in hundreds to spawn.

From a friend in Ireland we have a letter dated Abbeyleix, Queen's county, April 2d, which says:—

"The winter here has been one of the driest and mildest for years. There have been only two days the whole season in which they could not hunt, which is marvellous—no frost or snow—(I speak of Ireland; in the north of England, it may have been more severe). Fishing has been unusually good so far, the salmon having entered the English and Scotch rivers earlier, and in greater numbers than for years past; this is evident from the low price they have brought in the London market, which this year in the beginning of the month of March, was little more than it generally is two months later. I have been unable to try my hand as yet, but next week hope to fish the More, and if I have any sport will send you an account."

HOW TO PICK OUT A YOUNG CHICKEN.—Carefully remove the shell from the larger end of a hen's egg that has been subjected to the process of incubation for a period of twenty days, and gently extract the youthful "gallus" with your thumb and forefinger.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, trails, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

CLEVELAND, Ohio.—Which makes the best coon dog, pointer or setter? Ans. In a big field trial match, the dog that makes the most points on coons.

J. E., Chittenango, N. Y.—Can you inform me where I can get a pure blood Newfoundland dog pup, about five or six months old, and what would be the price? Ans. Any gentleman having such an animal, if he will write to this office we will give the full name of the inquirer.

J. H. W., a correspondent at Fort Wayne, Indiana, asks us for plans for a club house for an association of sportsmen just formed. It is to stand near a lake and to cost about \$800. Possibly some of our club friends have plans to place at the disposal of our correspondent.

F. F. C., Arion, Ohio.—Where can I purchase pigeons for shooting? Ans. If you want wild pigeons, write to Silas M. Allen, Esq., Secretary of the Leatherstocking Club, of Oswego; he will give you the name and address of the party who are supplying the New York State Tournament.

SCORPION, Cedar Rapids.—To make linen fish lines water-proof, stretch them taut from one garden fence to another, and paint them neatly with shellac; then placing a piece of oil silk in the palm of the hand, draw the line through it so as to distribute the varnish evenly.

C. H.—How shall I take care of a young alligator? Ans. To transport an alligator, put him into a box with slat sides, long enough to hold his body and leave the tail sticking out, just as you would a peacock. Feed him on meat, fish, or "garden sass," and keep him in a pen with an incline which slopes into a puddle of water. Alligators will live a long time without food.

ALOSA, Fort Edward.—Shad spawn ripen in the Hudson River in the latter part of May, and continue until July 4. In the fore part of the season there are three males to one female, and in the latter part the reverse. Shad have sixteen thousand spawn to one pound of fish; speckled trout have fifteen thousand spawn to the pound of fish; salmon one thousand to the pound; black bass ten thousand to the pound.

J., Fort Wayne, Ind.—1. Do you think a decarbonized steel barrel safe and serviceable? Ans. We do most explicitly. We think decarbonized steel has tenacity sufficient and will stand extra heavy charges, and will keep under usage a clean polish inside of the barrels. 2. For general use, which would you advise, a 10 or 12 bore gun? Ans. A 10 bore.

ARCADE, St. Paul, Minn.—The publishers and prices of the books you want are as follows: Dongall, J. D.—Shooting Simplified, 2d edition, 12mo 6 shillings; Robert Hardwicke, London, 1865. Colquhoun (John)—Moor and the Loch—Sto, 9 shillings 6d., London, Murray. Revell, B. H.—Shooting and Fishing in North America, trans., 2 vols., p. 80, 21 shillings; London, Tinsley Bros.

P. S. GAMBER, Ohio.—1. What should a puppy be fed on between the ages of 4 and 12 months? Ans. Milk, vegetables and boiled pannich. 2. Should he be allowed to run loose, or should he be kept tied up? Ans. Exercise him every day. 3. What is the proper age at which to take him into the field for the first time? Ans. When he shows a disposition to hunt game; for the other questions, see "Kenneling and Feeding Dogs" in the last three numbers of FOREST AND STREAM.

N. DRULLARD, Buffalo.—Is the land-locked salmon the same fish as the true salmon? Ans. This is a disputed question, but the general impression is that it is, as its marks and general features are the same. Its distinctive characteristic is, that it does not go to the sea like the true salmon; it is not anadromous. For fullest printed description of land-locked salmon see Fallock's "Fishing Tourist," pages 101-105. Experiments are being made to prove that the *Salmo Salar*, or true salmon, will thrive and propagate when debarred from the sea. If it will, it may be safely affirmed that the two apparent varieties are identical.

H. M. D., Jackson, Mich.—I would like to ask your advice upon the kind, quality and quantity of fishing tackle for our small lakes in this section; we get black bass, rock and silver bass, perch and pickerel, and a fish that is called a sunfish; could we use flies for our fishing here; if so, what kind; what would be the expense of a full assortment? Ans. Get a ten-ounce ash and lance wood rod, which with nickel reel and linen line (5c. per yard), would cost \$15; two of McFar's or Buel's spoons and a trolling line. \$5; 1 doz. bass flies assorted, \$3; 2 doz. Limerick, Kirby and O'Shaunnessy hooks on gut, \$1.50, and a couple of cork floats for the perch, sunnies, &c. Total without discount, \$25.

F. S. E., Lawrence, Kansas.—For the past three or four months my setter, a fine, good-blooded bitch, a little over two years old, has had a bad nose—hot and dry, badly encrusted, and with a slight colorless discharge. Had the distemper when a pup, and came out of it nicely. Thinking, however, that it might be a return of it, treated her accordingly, following Mayhew's directions as closely as possible, but with no good results. Next, on the supposition that it might be fever of some kind, gave her aconite in small quantities (not over three drops at a time). This did no good, and now I am at a stand-still, and as no one out here knows anything about dogs, am at a loss to know how to handle the case. She appears perfectly well, eyes bright and clear, appetite good, but have kept her on light food and taken good care of her. Her nose shows she is not in good health, and yet she has always had the best of care and food. Puppies last fall but lost her litter, except one; was entirely over that, however, before the above set in. Can you tell me what is the matter with her and what to give her? Ans. We cannot state what you should do, except to keep the kennel perfectly clean, let the dog run on fresh grown grass, and give buttermilk and a little sweet spirits of nitre. Perhaps some of our readers could give some further information.

C. P. K., Belleville, Ill.—A party of gentlemen here have recently organized a club for the purpose of fish culture, and would request your advice as to the kind of fish we can best raise in our ponds. We have neither mountains, nor surface rock, nor clear running streams in this part of the country, but rich prairie soil and muddy, sluggish creeks and bayous. The club now owns a small artificial pond, fed by two small springs and by rain water, is 350 feet long by 120 wide; at the centre 100 x 100 feet; the depth of water now is 22 feet; minimum depth during last dry season, 8 feet; from this square sloping up to banks; water good and clear; all rain water passes into this pond from a settling pond through a clarifier; bottom at deep places rocky; loam on the slopes; there are now in the pond sun perch and catfish, the only native fish worth anything at all; these are thriving very well. You would confer a great favor by advising us what kind of fish, if any, of a better quality, we might raise in the pond, where and when to get them, at what price, and how to treat them when received. By next spring we will have another pond of several acres in extent, fed exclusively by an excellent spring. Our idea is to excavate the latter pond, so as to have a mean depth of water of 14 feet. Do you think we could stock such a pond with trout or black bass? Ans. 1. A large pond fed by a small spring and rain water will not support game fish. Stock it with the Oswego or grass bass. 2. Write to A. S. Collins, Caledonia, N. Y. 3. Depends on the size of the spring. If the spring is large, brook trout; if medium, black bass. If small, try California salmon. Probably Oswego bass would be best.

—A man in Wisconsin found recently that the flames of burning kerosene can be extinguished by throwing on flour. It seems reasonable that any absorbant material not readily combustible might be effective for such a purpose.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch. 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, APRIL 30, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

THE CHANGES AT WIMBLEDON.

AS might have been expected, there is no end of comment in England in regard to the changes made at Wimbledon. Conspicuous among the numerous correspondents is a pretty strong protest from Lord Elcho, which appears in the last number of the *Volunteer Service Gazette*. His lordship objects not only to the whole new system of targets, but to the material, (canvas,) and states that he believes he only expresses the general feeling of the Volunteers. Lord Elcho thinks that the change of targets will be hurtful to the position of the English National Rifle Association. His letter mentions that there are numerous other ranges in England and Scotland, and that either the new systems of targets must be adopted at great cost by other ranges in order to be like those recently adopted at Wimbledon, or that by adhering to the old plan those using them must be permanently out of gear and harmony with the National Rifle Association.

In our issue of April 2d we gave a full description of the new targets. The method of marking we will now endeavor to explain. The targets are made in duplicate, one above, one below, like the upper and lower frames of a window sash, and work in the same way, either by weights or levers. The upper target of canvas is the one shot at. The lower one is in the trench, and under supervision of the marker. It is in every respect like the upper one, save that it is covered over with a wire netting. Now the following is about the *modus operandi*: The real target is a ball sent through it anywhere, say in the bull's eye. It is then lowered, and sliding down comes precisely in the front of the false target. Where the perforation exists in the real target a red disk is hung on the wire netting of the exhibition target. The exhibition one is then raised up. During its examination by those using the range, a piece of paper is stuck in the hole made by the bullet in the true target. The real target, having had its hole stopped, is then raised, the sham one lowered and the shooting goes on. The objections seem to be that the marker might occasionally miss a shot, as the perforation might escape his notice. Another fault found with the canvas target is, that the peculiar thud made by the ball, perfectly appreciable not only by the marker but by the marksmen of certain ranges, where the present iron target is used, is lost when canvas comes into play.

The *Volunteer Service Gazette* expresses as yet no decided opinion in regard to the change. It states, however, that marking can be much more rapidly done by the new method and that there is even less chance of danger. We

have before this expressed our decided opinion that any changes in our present system, such as is used at Creedmoor, should not be entertained for a single moment. It will be time enough for us in five years from now, perhaps sooner, to make changes. But we must be satisfied with creeping first before dancing. What we do believe is, that American ingenuity will devise a method of telegraphing when the balls strike the target, which can be read instantly by means of a dial placed right along side of the marksman. Between, however, facilitating the method of marking and the change of the target, there is a wide difference. Let us then, at least for the present, be quite conservative in regard to Creedmoor. If ties are of too frequent occurrence, which may not be at all an impossible event this coming season, the Committee of our N. R. A. can readily solve the difficulty. For the present, as far as the targets go, we are for the old system.

DESTRUCTION OF BUFFALO.

A MONTH ago Congress passed Col. Fort's bill for the protection of buffalo, prohibiting the killing of these animals for their hides only, and forbidding whites to kill cows. The act as passed is good in its intent, and will no doubt accomplish something toward stopping the slaughter. If it does, generations of sportsmen will remember Col. Fort as a public benefactor. Still, we doubt if it succeeds in any great measure, and we shall now proceed to give our reasons for such opinion. Some of our readers may recollect that we advocated in a previous number of this journal (Vol. 1. No. 25) the imposition of a special stamp tax of one dollar upon all raw buffalo hides offered for sale during the close season designated by law, the effect of which would be to render it impossible for those who killed out of season to compete in the sale of hides with those who killed at the proper time. We wrote to Col. Fort, begging him to incorporate this provision in his bill, and were encouraged at the time to expect that it would be done. We regret that it was not done, for the act as it now stands does not meet the case, and we fear will be found impracticable to enforce. Of one thing we are convinced, it will be difficult to educate the buffalo hunters and prairie trappers to prefer "poor bull" to "fat cow." Bull meat is always thrown aside, except the tongues and certain selected parts of the carcass.

Wishing to obtain all available facts to enable us to write intelligibly upon this subject we addressed special inquiries to officers of our frontier posts throughout the buffalo range, believing them to be disinterested, and therefore more competent to speak impartially than civilians. We cannot, perhaps, present the matter in plainer or more positive terms than to print *verbatim* one of the letters that we have received. The writer is the commandant of a post located in the Indian Territory, where he can see "just how the thing works." First, he premises that to connect the Indian question, or rather its solution, with the buffalo is simply absurd. He says: "Were every buffalo on the southern plains to be killed to day, our Indian troubles would go on to-morrow, so long as poor Texas affords its tempting offers of horses and cattle, and the government follows its present policy of feeding the Indian; the buffalo is no longer an absolute necessity to the Indian, but simply a luxury; he kills for robes, not to wear, (for the government gives him blankets), but to trade; he kills for meat, not that he needs it, for he is fed beef, but because he relishes it. So, the visionaries' solution of the Indian question by 'killing all the buffalo,' may as well be cast aside as nonsense, for it is surely to be hoped that before many years, a just, honest and efficient policy may be pursued towards the Indian, and that we can conscientiously aid in the increase of the buffalo instead of furthering its foolish and reckless slaughter."

Herewith we append the body of his letter:—

"Taking the 99th meridian as a line, and the crossing of Red River as a point, the buffalo begin to make their appearance in early fall in numbers, though a few straggling bulls, and even small herds, may be found at any season. The herds cross this territory and into Texas in early winter, moving again north in March. They drop their calves from middle of April to middle of May.

Now comes a strange question of yours, which shows that even you, who have traversed the prairies in years past have no idea how greatly they are being diminished. You ask "how does the prairie look after they are gone, cropped clean, buffalo skulls, bones, &c., much stamped and dusty?" And the answer is *no* to every point in the question. There are *not enough of them to leave such evidences*. Where a few years since a broad black seething mass of living flesh passed across the prairies, leaving such evidences, you now see at the utmost a few thousands together. I think five thousand would cover the largest number to be seen at any one time in this territory, and I am sure I have put the number at a high mark in saying that. Horace Jones, the interpreter here, says that on his first trip along the line of the 100th meridian, in 1859, accompanying Major Thomas—since our noble old General—they passed continuous herds for over sixty miles, which left so little grass behind them that Major Thomas was seriously troubled about his horses, that he has since been over the same country, and that five thousand would be a large number to see at any one time." This shows what slaughter there must have been in the past ten years.

The skins are in season, in colder months, beginning the new coat in October, and best in January. The best meat is calf; then after that, I should say two to three years olds, and cow always in preference. Bull meat, except when young, say three years or so, is not good, tougher than beef, and but little except hump, tongue, tenderloin, liver, &c., are ever used unless from necessity. I believe five hundred pounds of meat are wasted for every pound eaten.

"Do whites slaughter needlessly?" It is the exception and very rare at that, for them to slaughter *any other way*. They simply kill for the love of killing. I know of but

few instances in which even the hide was saved by gentlemen sportsmen. The sole idea seems to be, to *kill a buffalo*. I am glad, however, to state that but little needless slaughter goes on in this territory, it being unoccupied by whites, nor is there much of it slaughtered in upper Texas, though I know of an instance in Texas of a man offering for sale *two barrels of tongues*, and I am certain that this man did not cure over ten robes, or a ton of meat. You can calculate how much waste of meat there was in that instance.

"Do Indians slaughter needlessly?" They both do and do not, which anomalous answer needs some explanation. The Indian in his natural state does not "kill the goose that lays the golden egg." He is too true and natural a sportsman to do that, but contact with whites and civilization has engendered many unnatural tastes, to supply which they kill for robes solely with the view of trading. The articles are many of them useful, but many are simply luxuries, and some useless, including canned fruits, nuts, canned milk, umbrellas, and all imaginable knick knacks. It may surprise many of your readers to know that the wild Comanche buys his clothing, his eatables, and even his *buckskin*; that he produces nothing that he can purchase with robes, that he seldom kills deer, and never soft dresses the skin, in fact, for the purchase of these things the Indian kills many times the amount that he needs, but this he considers one of his inalienable rights, and I believe it impossible to prevent this useless slaughter so far as the Indian is concerned.

"Do either Indians or whites kill out of season for skins only?" There are two seasons for killing for robes by Indians; one in the summer, in the breeding season. When the hair is short, they kill for lodge skins. A lodge lasts but two years and must then be replaced. Then they kill again in the winter for robes for use and traffic, killing *always*, cows in preference, and right here you have a great if not the *greatest cause* of diminution; the Indians always *kill cows* in preference for both meat and robes, and this during the time that they are heavy with calf. It is only at these times that the Comanches, Kiowas, Cheyennes, Arapahoes, and Osages kill, except occasionally in small quantities for meat. To the killing of the cows, I attribute the fact of running across so many more bulls. It is an odd notion that the younger bulls drive the old fellows away, and mind you, I do not deny that the reason we see so many old fellows on the outskirts of the buffalo range is due to that fact, but that will not account for the frequent herds of twenty, fifty or several hundred, and *all bulls* which you come across. It is only when you get to the very largest of the herds that you ever see a cow or calf. The whites as you are aware are slaughtering them to-day in Kansas and farther north by the thousands, and green and undried skins are sold for a dollar.

"Where is wasteful slaughter greatest?" Along the line of the Kansas Pacific and Union Pacific, handy to transportation.

According to the Indians, there are two large gangs of buffalo, divided by the Platte River, the gang south of it moving that far north in the summer, and back south again in the winter, as far as the Concho in Texas, and the other gang north of the Platte remaining there. This is the idea of the Comanches; they always speak of the two different lots showing that there is probably some basis for the idea. The range of buffalo here is getting very limited, barely coming east of 99th meridian, and going west only to the edge of the Staked Plains, a belt of country not much over one hundred miles and getting less and less constantly. Two years ago numbers of them still grazed near and east of the 98th meridian. Bison.

FORT SILL, G. T., April, 1874.

* EXTERMINATION OF THE SEAL.

NEW and rapid methods of locomotion, weapons of greater accuracy and the incentives of commerce, are certainly tending every day more and more towards the extinction of certain of God's creatures. There is not the least doubt that many of the marine mammalia are doomed to entire extinction. It is by no means difficult to make out a list of those which have almost entirely disappeared. The manatee is now limited to a few rivers. The right whale of Greenland, the walrus of the St. Lawrence, the smaller whales of our own coast, are no more. On the islands of Ascension, Tristan d'Acunha and the Crozettes, the gigantic sea elephants were once found in abundance. To-day not one is to be seen. It is not man's power to convert all animals to his use, which can be doubted, but it is the abuse of this power which is to be dreaded, and the slaughter of creatures in too great quantity and at improper seasons.

Some time ago a correspondent to a leading English journal wrote as follows:—"Who can read of the butcheries which are yearly perpetrated on the breeding seals of the ice-floes in the North Atlantic, as are recorded with more or less zest in the newspapers without feeling that the same fate, *utter extinction*, awaits the seals as has already overtaken so many of their fellow-denizens of the deep?"

The question of seal hunting in the British Provinces by means of steamers, we have dwelt on casually before. We think that unless legislation be directed toward this method of capturing the seals, limiting the trips of the steamers or defining the seasons when they will commence business, even fixing definite rules as to the number, the size, the quality of the seals they shall take, before long the seals will be entirely exterminated on the Northern Atlantic coast, or else the business will have to be prosecuted amid the ice-floes of the extreme north with more danger and diminishing profit. We publish a letter forwarded to us from Washington, written by one of the best authorities in St. John's, which tends to show that in a short time, from pure exhaustion of the seals, the business is likely to cease entirely. We believe, as does the writer of this letter, that excessive killing and worrying of the seal by steamers, must eventually deprive the British Provinces of one of their most important industries. It is the old story of killing the goose which lays the golden egg:—

"We know enough of our sealing lottery this spring to be aware that we are to draw a big blank. For six years past steamer after steamer, each one a size larger than the last, has been built to slaughter seals,

Sporting News from Abroad.

SOME of our English contemporaries, in whose columns matters appertaining to the turf have the greatest prominence, devote a portion of their advertising space to notices of a peculiar character. Advertisements of Commission Agents, Subscription Lists, or Turf Agencies, are there displayed in imposing capitals. When we come to read them we find that these places of business are in Scotland. Of course our readers, or at least some of them, are familiar with their character. They represent gambling offices, where the odds can be bought or sold on the various horses likely to run in England during the racing period. Prior to 1853, when an act was passed for the suppression of betting houses, such establishments—true dens of thieves—existed in England. Driven from England in 1853, they opened their nefarious business in Scotland. The law in England in regard to betting houses was as follows:—Any person opening a betting house was subjected to a penalty of £100 and costs, and in default of payment, to six months' imprisonment, while the punishment for receiving money as a deposit by way of a bet or wager, rendered both principal and agent liable to a fine of £50, with costs. A fine of £30 was also imposed, which was to be paid in case even the advertisement of such a betting house, existing in England, was found in a paper in England. The act not extending to Scotland, the gambling business then found a new field there. Sir A. Cockburn, then attorney general, who fathered the measure, was, however, most careful that no interference in betting was intended looking towards transactions carried out at Tattersall's. In fact, as a leading English journal expresses it, "legitimate betting was to be tolerated, but the houses, shops, and booths of professional gamblers were to be suppressed." In other words, it might be carried on at Tattersall's, where dukes and gentlemen met to wager their thousands of pounds on horses, but in the dingy dens of betting houses, where the snobs, or welshers, or broken down turfmen gathered to gamble away their half crowns, the thing was to be put down. Certainly, between Tattersall's and a miserable betting stall there is a distinction, but hardly a difference. In England, however, public opinion—say what we may about conservatism and all that—is changing. To-day, a new act is threatened which goes further than the old one. The former was directed towards the houses; this new one points towards the men, and will eventually close up all the betting establishments, Tattersall's, at least for the present, not included. England is a place of strange anomalies, and it seems curious how one certain place should, like a sanctuary of old, hold high class, stupendous gambling within, free from public interference, while in another of less state and pomp all paltry betting transactions should be not permissible. The time will come when Tattersall's itself will be considered as prejudicial to the well being of the State. Baden, with its *rouge et noir* and *roulette*, went to Monaco, and from Monaco it will go to what the French very politely call *le néant*. The twentieth century, when it does come, is neither likely to tolerate, legalize, or keep free from the interference of public opinion a gilded temple—be it called Tattersall's or anything else—which tempts people to waste their patrimony, or tends to eventually demoralize them. Men will gamble: it is one of the frailties of human nature, but it does not belong to a positive, advanced state of morals to give any class of human beings—be they earls or chimney sweeps—immunity from the opprobrium in which gambling must be held. We write most feelingly on this subject, as we notice no end of efforts now being made in the United States to introduce all the high and low English methods of turf gambling.

—Who would not like to play at coaching in Ireland, and bowl along such a charming country as the Vale of Avoca? Why, there is music in the very name of it. Think of driving out of Dublin with a gay coach and spanking team of Irish horses, and rattling along the road. What lots of fun; what studies of character! Now there is a gentleman in Ireland who, fond of coaching, only wants two other good fellows to join him. The capital required is some \$6,000, and at the end of the season, though the starter of the enterprise honestly promises no profit, he frankly admits that the absolute loss will only be about £100. Can't we find some retired California gentleman, who has driven some of those teams where an inch one way or the other on the road would have settled the business of the whole fares (the lynch pin tragedy being put out of the question), to take a hand in tooling the tits along the Vale of Avoca? Perhaps, if up to sport and with plenty of money, our Californian might introduce, at a convenient distance from Dublin some peculiarly dangerous places, imitating a gulch or a rocky cañon; in fact, convert the ride out of the capital of Ireland into a kind of stage coach steeple chase. The theme is wonderfully suggestive. But we are afraid the Californian stage driver of our fancy might think the whole performance trite without the introduction of an occasional gang of robbers, who, bringing the coach to a stand, would deftly relieve everybody inside of their goods and chattels, interspersing the amusement with some exceedingly clever pistol practice.

—The *Field* has been singularly embellished lately with some most charming descriptions of fishing by its distinguished editor, Francis Francis, Esq. A thorough sportsman, Mr. Francis writes of what he catches and shoots, and he does it in most vigorous style. "A Month on the Thurso" has given us a most thorough insight into the delightful sport of the Highland country. In his last paper

until now we have twenty-eight, some of them almost large enough for Canarders. Each spring these vessels have attacked the seals in all conditions and under all circumstances. They have killed thousands of pregnant mothers, torn the living, breathing and bawling foetus from its nest and left it to perish. Thousands of 'cats' have been brought in, few if any being left for purposes of propagation. In the last four years over 2,000,000 seals have been brought to port and converted into oil, but for each one so legitimately utilized, at least ten have been slaughtered. So that over 20,000,000 seals have been in various ways destroyed the past four years. We are now beginning to feel a heavy drain upon our funded capital. Our stock of specie has pretty nigh run out, and this spring the seals proved to be like the Irishman's flea, 'You put your finger upon him, but he isn't there.' I do not think our catch of seals for the spring will exceed 180,000, and they of very inferior quality—that is, too young to pay for the taking. No one regrets the failure, as it was just what was needed to punish the inhuman greed and selfishness of our capitalists. We all fervently hope and pray that no steamer will ever again get a catch of seals. The Canadian steamers are still very unfortunate, but have done better than ever before. The 'Iceland' has brought in 2,400 and the 'Greenland' 5,300, and both have gone on second trips."

THE SEAWANHAKA YACHT CLUB'S CORINTHIAN CUP.

WE call the attention of our readers to the circular letter of the Seawanhaka Yacht Club which has been sent to the owners of all schooners belonging to any of the recognized yacht clubs in the country, and we trust that it will meet with the ready response which the Club so thoroughly deserves for its enterprise and energy in introducing in our waters the system of "Corinthian racing." In all yacht clubs may be found two distinct classes of members; first, those men whose ambition is satisfied with the possession of a well appointed yacht, the knowledge that they have it in their power to hire competent officers and crew and plentifully supply their larder, and to whom the power of discriminating between the bow and stern of their vessels does not appear a matter of the slightest possible consequence; and secondly, we have men who either are or desire to be sailors, and who, if they have captains, are capable of determining whether the prospective "dusty" weather of said captains upon occasions, means engagements ashore, who delight in sailing and navigating their own vessels, or if they are not fortunate enough to possess yachts would volunteer with alacrity to man those of their friends upon just such an occasion as will be the race referred to. For the first-class, Corinthian racing will do nothing, for by their ignorance they are excluded from participating; but for the yachtsmen, it will do everything; practice under these circumstances will make of them hardy, active, and daring seamen. The circular will be found under the head of Yachting and Boating and will explain itself.

WEST JERSEY GAME PROTECTIVE SOCIETY.—The President of the West Jersey Game Protective Society has kindly forwarded to us the following report of its last annual meeting. We are pleased to see the business energy manifested by this society, and to know that it has taken the initiative in the important movement of introducing the pinnated grouse once more into New Jersey. There is much activity displayed by individual members and the society is generally in a very flourishing condition, numbering 250 members and receiving constant accessions. Mr. Rosenbaum informs us that he shall endeavor to get at least twenty-five pairs of grouse next fall to be placed in Burlington county, and should the Philadelphia Club do anything in that direction we are quite sure that within a very few years we shall be able to have fair sport in certain localities. Under the new game law no game can be shot in New Jersey until November 1, 1880—penalty for killing \$50. There should be no difficulty therefore, in propagating this particular bird, if any attention at all is paid toward looking after them after they are placed:—

CAMDEN, N. J., April 22, 1874.

EDITOR FOREST AND STREAM:—

The annual meeting of the West Jersey Game Protective Society was held at the West Jersey Hotel, in Camden, on the 15th inst. Quite a large number of members were present, the city of Philadelphia being largely represented. A marked interest in the object of the Society was evinced, and the methods of propagation and protection of game and game fish freely discussed. The secretary was ordered to issue 2,000 copies of the late "Act Consolidating and Amending the Game Laws of the State." The following resolution was adopted, and ordered to be sent to the FOREST AND STREAM for publication:—

Resolved, That this Society will heartily co-operate with the different Game Protective organizations in any movement looking toward the introduction of pinnated grouse, and that a committee of three be appointed to confer with the different societies in order to effect that object.

The following gentlemen were thereupon appointed that committee: B. W. Richards, 524 Walnut street, Philadelphia; Henry G. Smith, Philadelphia, and W. B. Rosenbaum, Malaga, N. J. Hastily yours,
WEST JERSEY.

Herewith we append some remarks from our valued correspondent "Homo," respecting the co-operation of the New York, Pennsylvania and New Jersey Sportsmen's Clubs, in the purchase of the pinnated and sharp-tailed grouse:

EDITOR FOREST AND STREAM:—

Before the Sportsmen's Clubs and Game Protective Associations of New York, Pennsylvania and New Jersey, move further in regard to restocking our eastern barrens with pinnated and sharp-tailed grouse, it behooves the New Jersey Society to so modify their law as to allow those clubs joining and furnishing their money in the joint enterprise, to have free access, in proper time and season, to the game their friends have purchased, and to modify the present *non-resident tax* on sportsmen, especially as to shooting prairie chickens.

It stands to reason there can be no co-operation of the societies unless they are one in the enterprise, and I fear without a mutual arrangement can be made (I do not speak officially) the Philadelphia Club will feel more like "planting" their birds in the Pennsylvania, Pocono, and York barrens, where the pinnated grouse once thrived as well as they did in New Jersey, than consenting to attempt it in the latter State at all. Burlington county, outside of the jurisdiction of the West Jersey Society, would be chosen.

To illustrate how one-sided the matter would be if a free license would not be granted to the Philadelphia Club for the shooting of grouse, I would mention that our Philadelphia law gives members of the New Jersey Society permission to shoot all game, in proper season, in

any portion of the State, and which would include prairie chickens and sharp-tailed grouse, when we re-stock our own barrens. We might say to the West Jersey Association, "Come, brother sportsmen, help us with your money to purchase grouse for Pennsylvania, and join us freely in the sport of shooting them. We will assist you in like manner to stock your grounds, but do not, we pray you, ask us to pay a license for what is already half our own."

We are all deeply interested in the proposed project, and read the letter of W. C. H. in the week before last issue of the FOREST AND STREAM with great pleasure. I am sure he would be a faithful guardian and protector to the grouse in his section of the country, and woe betide the "Arab" or pot-hunter caught by him overstepping the line of duty.

Dr. F. Jenkins Purnell, of Berlin, Worcester county, Md., has proven that the pinnated grouse can thrive in his region; from the breeding of only two pair the first year he has now two thousand, if not more, in the neighborhood of Snow Hill, but it required a stringent law to protect them, and the making of every man and boy a watchman, as it were, over them.

The sharp-tailed grouse would breed fully as well with us as the pinnated, being a covert-loving bird, and hardy; our scrub oaks would suit them exactly. Therefore, in the enterprise, let not this superior game be forgotten and have as much attention paid him as to his larger cousin—*Tetrao cupido*. An equal number of each should be purchased.

"Homo."

PIPE SMOKING BY MACHINERY.—The following communication, in regard to a new patent and approved method of accomplishing that most desirable thing, which is in fact the chief end and aim of some men's lives, viz: "How to color a meerschaum," comes to us apparently anonymously. But a peculiar fine latent flavor of green seal Perriquer which hangs about the paper, on which this wonderful secret is written, discloses its author. Think of a pipe coloring itself! We trust the *Scientific American* will not consider that we are poaching on its grounds, in giving to the world this method of coloring a pipe, without going through the formality of a patent right. As it is, we suppose Kalemberg, our greatest pipe maker, will try it straight, and sell his customers his sea-foam pipes, colored with the richest amber and chocolate hues, all shaded to a nicety by the new process:—

I know, Mr. Editor, that like all right-minded editors, you are averse to anonymous communications, but I must ask if you to relax your rules in my favor, for fear of the "water rates" restraining me from giving you my name and address.

I presume that FOREST AND STREAM may have among its readers men like myself, combining two possessions, viz.: patient disposition and a fine meerschaum pipe, on which they would like to see now the mahogany hue, which ordinarily can be produced only by long and patient smoking. I colored one meerschaum beautifully by lending it to a Dutch shoemaker and supplying him with the weed; but he supplied his visitors, other Dutchmen, and returned the pipe with a villainous odor. I have no Dutch cobbler now, though, nor do I need one. My pipe is coloring now in the third story, locked up in a room by itself, and I am in the parlor telling about it.

The river—we'll say Croton—is at work for me, and works well. My pipe sets in a block fitted to its shape. In its bowl is a good-sized tin funnel, holding a half pound of cut up plug. From its mouth-piece a bit of india-rubber tubing connects it with the machine, which is this: A tin tube a foot long, $\frac{1}{4}$ inch diameter, closed at the upper end, air tight, is standing in the hole in a stationary wash basin about three inches from the top. An ∞ shaped tube connects with the water cock. Two inches above, on the opposite side, another little tube at right angles receives the india-rubber tube from the pipe. Water is started, rushes down through tube, produces vacuum in upper end; air draws through the funnel, pipe and rubber tube, goes down with the water, brings the smoke with it, smoke, water and air discharge through the sewer; it works. In three days I have browned up that pipe in a way that will give me much future pride, when complimented by those who don't know how it was done.

SMOKER.

LETTER FROM MAJOR LEECH—THE IRISH TEAM TO BE COMPOSED OF SIX.

THE following letter from Major Leech will be read with interest. The Irish team will be represented by six men. We would have preferred eight, but it must be recollected that it is difficult at any time to bring together or to cross the Atlantic with a great many men. We believe that Mr. Leech has done all in his power to meet our views:—

IRISH RIFLE ASSOCIATION,
DUBLIN, Monday, April 13, 1874.

Dear Sir:—On the 18th ult. I had the pleasure of writing to you in reply to your favor of the 4th ult., and I somewhat anxiously pressed upon you the acceptance of my proposal as to the number of our team being not less than four or more than eight at the same time stating my hope to be able to make it eight, both these letters were some what ex-officio, as I believe you kindly wrote to prepare me for the decision of your committee on the subject, a courtesy for which I thank you. In your subsequent letter of the 11th ult., you announce the acceptance by the Amateur Rifle Club of New York, on behalf of the American Riflemen, of the programme forwarded to me, with the single exception of the number of competitors, which they desire should not be less than six for each country. Of course I am well aware that so small a team as four would necessarily exclude many who might be quite as deserving of representing America as the gentlemen actually chosen, and the disappointment thus caused you naturally desire to reduce to a minimum. I and my friends are desirous as far as we can to meet your wishes, and have resolved upon accepting the amendment of the programme suggested by your committee, namely, that the team shall be not less than six, and I congratulate you upon the conditions being thus finally agreed upon. Perhaps, therefore, you will please to send me the programme in duplicate as amended, one signed in behalf of America, and the other for my signature, which I will be happy to perfect and return to you. I hope we shall go to America as winners of the Elcho Shield again in July next at Wimbledon, but the odds against us are so great that our being champions for two years in succession is almost more than we can hope for; still, the scores of the Irish team, when that match takes place, will, I am sure, be such as to induce you to believe that we are not unworthy to compete with our American friends.

I have the honor to remain,
Yours very faithfully,

ARTHUR B. LEECH.

Chairman of the Counsel Irish Rifle Association.
To Colonel G. W. Wingate, President Amateur Rifle Club,
194 Broadway, New York.

Mr. Francis tells how, on a fishing excursion, he met not with one bull, but with two of them, one on each side of the river. There was a Scotch laddie with him, and Mr. Francis was debating in his mind whether he would not lower his English dignity in the Scotch boy's opinion by running. We copy the story as we find it. "Just then the laddie shouted out, 'He's eomin!' he's eomin!' and bolted like a wild goose. I looked back, a hasty glance over my shoulder, and there, horror of horrors, came the bull thundering down the bank, about eighty or a hundred yards away, straight for us, having just caught sight of us. An open moor was before us; no shelter whatever but a river, which we might have taken to, only there was a bull on the other side, too, and likewise cows, which count for something in a serimmage. I really am ashamed to admit it, but I bolted, too. As I bolted I glanced back; the bull was gaining. It might have been a pretty race to a looker on—equal to the boat race, in fact; but the bull here was Cambridge; it was all 3 to 1 on him, and the horns of a bull are much worse than the horns of any other dilemma I know of. Fortunately, just then we came to a place where peat had been cut, and there was a bank four or five feet deep. 'Bob down! hide!' I called to the boy, who was close to me; and I jumped down and crouched under the bank." And so the editor of the *Field* was saved. We fancy everybody must have been chased by a bull, though few can tell of it so pleasantly as Mr. Francis. Our most excellent confrère tells, too, of shooting the famous blue rocks in their native cliffs, and says:—"Talk of partridge or grouse driving, or a rocketing pheasant! It is child's play to it. If you didn't hold a couple of yards ahead you had no chance, and often when the distance I pitched my gun in front seemed almost preposterous to me, it was quite wonderful how they came in for the thick of it."

—The members of the famous Gun Club, at Notting Hill, are now trying their skill. We notice that in the handicap sweepstakes Mr. H. S. Jaffray was the winner, among nineteen competitors. Mr. Jaffray used sawdust powder in both barrels, and shot off a tie with Sir Charles Mordaunt, winning in the second contest.

—The hunting season of 1873-4 now draws to a close in England. Foxes have a chance for life once more. Boots, pinks, and breeches are put aside for the coming fall. As careful registers are kept, the following details may be of interest. The old Berkeley hunt had sixty-two field days, killing twenty-nine foxes. The old Berkshire were out ninety-five days, killing fifty-two and a half brace of foxes. The Vale of White Horse has taken the palm so far of fox killing, having hunted seventy days and killed ninety-three foxes.

—An amusing and novel race is that of the Manchester Polo Club, which is to come off on Tuesday, the 28th of this month. There is a Lilliputian cup for ponies for a half mile, and a Polo cup for three quarters of a mile, with five hurdles. Ponies are not to exceed fourteen hands in height, and the riders must be members of the Manchester Polo Club, save for the stranger's cup and military cup. When we come to know the weights the ponies carry the facts will be quite interesting.

Shot Gun and Rifle.

MAY IS A CLOSE MONTH FOR GAME.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

New members are rapidly enrolling themselves in the lists of the National Rifle Association, and a notable quantity of life memberships have been added. The officers of the Association are untiring in their efforts to increase the scope of their undertaking. The weather has been very unfortunate of late, preventing much active work in repairing damages at Creedmoor, but we have no doubt but that early next month the crack of the rifle will be heard at the range from that time on until cold weather commences. Our prognostications of seeing thousands on the grounds we fancy will be fulfilled more than once this season. All those desirous of joining the National Rifle Association should send in their names at once to Colonel Gildersleeve, Secretary of the N. R. A., whose office is in the new *Herald* building, New York.

WHAT OUR IRISH FRIENDS THINK OF THE COMING RIFLE CONTEST.—We take the following from the *Dublin Times* of April 7th:

The approaching rifle contest between the crack shots of America has created quite a *furor* in the latter country. All the American journalists have discussed the matter, and, we are happy to say, in the most genial and friendly spirit. One journal, *FOREST AND STREAM*, a sporting paper, has reproduced some observations of our own, and is publishing a series of short but carefully written letters upon long range rifle shooting, and upon marksmanship in general. It appears that the Americans can bring to the front almost any number of first-class shooters at a range, say of 400 yards, but that it is somewhat doubtful whether they can show in the field a team assured of victory over the Irish Eight at long ranges of 800, 900, or 1,000 yards. The rifle-men in the several States are called upon to practice incessantly at the longer ranges, and to send by the middle of July to the Secretary of the Amateur Rifle Club, New York, formal declarations respecting the numbers of bull's eyes made by each at the long ranges. *FOREST AND STREAM*, writes thus concerning the approaching trial:—

"When her Majesty's subjects are chivalrous enough to cross the seas to meet us, we should try and be ready for them, and whether we beat them or not we should, at all events, give them that right hearty welcome which they deserve. But we must not expect that these men will be easily beaten." The American journalist thinks that a

practice, extending over fifteen years, has eliminated, by frequent trials, the men possessing the requisites of a good long range rifle shot from among a much greater number of riflemen than there are in the United States, familiar with that branch of shooting. The writer forgets that in Ireland we have no volunteers, and comparatively very few rifle clubs. A single American State could, with ease, bring forward a greater number of adepts in the use of the rifle than the whole of Ireland. Although the Amateur Rifle Club of New York gallantly took up the gage thrown down by the Irish Rifle Association, it may so happen that not a single member of that club will be placed among the competitors. The Amateur Club, determined to win the victory if possible, calls upon all the rifle clubs in the several States to enter upon a course of steady practice until next fall. From among the numbers who will then have proved themselves to be the best shots will be selected the antagonists of the Irish Eight. Our few riflemen, therefore, boldly enter into competition with the very best shots of all America. The rules proposed by the Amateur Rifle Club are these: None but rifles of *bona fide* American make can be used; the rifles must not weigh more than ten pounds; the triggers must not have a pull of less than three pounds; all sights can be used except telescopic magnifying, and such as conceal the trigger so as to prevent the danger signal from being seen; any position will be allowed which can be taken on level ground without artificial rests. The States in which the greatest attention has been devoted to practice are New York, California, Maine, and Texas; and if from each of these great States but two champion shots are selected, the eight will equal the whole number of the Irish Team. The Secretary of the Amateur Rifle Club has already received numerous letters from riflemen in various parts of the Union who are anxious to enter the lists against the Irish Team. One of them, known as Texas Jack, proposes that the programme should include different modes of shooting, such as practice in the saddle, &c., which is the Westerner's "long suit." This marksman has evidently enjoyed the pastime of shooting the "flying buffalo," or perhaps the Red Indian. The Any Rifle Association of Ontario have decided to challenge the Irish Team, but we suppose that if the Irish Team accepted the contest with any club but that one which the members challenged they would have to contend against all the clubs existing in America. It is but just to say that the American journals with one accord express their admiration of the manliness and pluck of the Irish Eight in challenging the best shots of all America, and provoking them to action. The Messrs. Remington have forwarded £50; Mr. James Gordon Bennett £150, and others have given lesser sums to defray the incidental charges of the contest, and yet the American marksmen have not to bear the very heavy cost of a passage across the Atlantic and back. The contest is regarded as a national one throughout the States, as it should be regarded here, and no more should be required from the champions of each nation than that they should give their time and skill to support the honor of their respective countries.

—The last number of the *Volunteer Service Gazette* which has reached us, of April 11th, has a series of letters addressed to the Editor in regard to the change in the targets at Wimbledon. Very few of the writers seem to approve of the changes. If in some few cases, the round target is spoken of with favor; the system of marking is objected to. Perhaps the strongest advocate for the change is the late Secretary of the National Indian Rifle Association. Dr. Hamilton states that at 600 yards, the shots striking the paper target, unless the wind is blowing towards the target can be heard quite distinctly. One other peculiarity mentioned by this same authority, is quite curious. It is, that the older the target is, the stronger it becomes, which is accounted for by the fact of its being patched and remended over and over again. We wait with some anxiety the solution of this subject. Perhaps a great many of the criticisms are premature. When the targets are tried we trust some conclusion will be arrived at. We must still regret the change, as far as our own interests are concerned. We are inclined to think, as has been suggested by our able correspondent T. C. C., that there are much better methods of marking. Some automatic method is quite possible, which will be suggested in time by our own marksmen.

WESTON, Vt., April 25, 1874.

EDITOR *FOREST AND STREAM*:—

The articles on the rifle and rifle shooting have in me an appreciative reader. That by A. M. S. in the last issue is eminently suggestive and practical, and the concluding paragraph demonstrates the writer knows whereof he writes. Let the veterans be encouraged to "shoulder the crutch and show how fields were won." The "has-beens" are of use by way of comparison with the present, and in this light I would ask brother marksmen to read the following:

Till past the prime of life my favorite arm was the sporting rifle, shooting always off-hand. Lately I have used a target rifle with telescopic sight, resting. Copies of two targets made at 210 yards are on file in the Patent Office, Washington. One of five consecutive shots, with a wind drift of eighteen inches, measures 2½ inches. The other of ten consecutive shots, with a flaky wind of average three feet drift, measures 8½ inches. The string measure is from centre of shot to centre of bud.

On another occasion, at 100 yards, (and the only target shot at so short a range) ten consecutive shots made but one hole in the target, and that in the bud, the largest diameter of which was 1½ inches, all the slugs being welded in a mass in the wood backing of the target. The string measure of this target was impossible to take. Weight of barrel, 16 lbs., muzzle-loader, and inside made by N. & G. Whitmore, Mansfield, Mass.

C. L. W.

—Captain A. H. Bogardus, of Elkhart, Ill., matched himself for \$500 to kill thirty-eight out of fifty pigeons in the following singular manner. The match took place at Woodside Park, Stamford, Conn., on April 27th, and created considerable excitement among amateur and professional pigeon shooters. It was the greatest performance on record. The conditions of the match were that Bogardus should stand midway between two plunge traps, placed forty yards apart, both to be sprung at the same time, so that while he faced the first trap his back was to the second, thus making it practically double bird shooting, as he had to turn completely around in order to kill the bird at his back. At two P. M. the traps were placed at the distance specified. Ira A. Paine, of this city, trapped and handled against the shooter, and Mr. Jesse Smith, of the Astor

House, was chosen referee. Bogardus killed the first bird and missed the second. He killed the third, fourth, and fifth and missed the sixth. Betting was then 10 to 4 against him. He then made extraordinary shooting by bringing down twenty-nine in succession. He missed his fortieth bird, but brought down his forty-first and forty-second, and won the match with eight birds to spare. The four birds that were scored against him fell dead out of bounds. It was remarkable shooting, and eclipses anything of the kind ever attempted.

—The Philadelphia Sportsman's Club, despite the terrible weather, held their social pigeon shooting meeting on Saturday, April 25th, at the Tinicum Fish Club House. There were thirty original entries to shoot at ten birds each, twenty-one yards rise, eighty yards boundary, and 1½ shot; of these entries fifteen gentlemen came to the scratch. The shooting—taking into consideration that every bird was killed in a driving storm—was a remarkable performance. Two of the members killed ten straight birds each, and in shooting off ties one killed five birds and the other four. The prizes consisted of two elaborately wrought gold medals, ornamented with a woodcock and snipe, one beautiful silver souvenir in the shape of a pair of double guns embossed crossways, a silver medal, and a leather medal.

Every arrangement that could be made for an enjoyable day had been attended to by the efficient president, board of managers, and ground committee, and but for the storm no larger gathering of gentlemen sportsmen would have taken place in America. Governor J. F. Hartranft, of Pennsylvania, an honorary member of the club, visited Philadelphia, and would have attended had it not rained so incessantly. A number of outside private matches were to have taken place, and five hundred pigeons had been provided for the occasion. Certainly those that shot cannot be called feather bed sportsmen. After the conclusion of the "amusement" in the field, the party repaired to the "Fish House" dining hall and discussed planked shad and other eatables, which were bountifully supplied. The Philadelphia Sportsman's Club is fast increasing. It has already 300 members on its roll, and ranks as the first society of its class in the United States. The following is the score:—

Name.	Straight.	Killed.	Gun used.
H. B. P.	5	7	Peterman B. L.
J. K.	2	4	Kryder M. L.
Dr. S. P. B.	4	7	Greener B. L.
J. N. P.	3	6	Greener B. L.
B. N. M.	5	8	Evans M. L.
J. W. M.	5	8	Peterman B. L.
Capt. A. A. C.	4	6	Kryder and Moore.
O. P. G.	10	10	Peterman B. L.
Major J. A.	10	10	Peterman B. L.
J. C. R.	5	6	Greener B. L.
A. S. O.	4	8	Peterman B. L.
S. P. W.	2	5	Peterman B. L.
Capt. W. A. M.	6	8	Peterman B. L.
C. S. W.	3	6	Moore M. L.
T. S.	0	3	Kryder M. L.

TIES FOR FIRST PRIZE.			
O. P. G.	5	5	Winner 1st gold medal.
Major J. A.	4	4	Winner 2d gold medal.

TIES FOR SILVER MEDAL.			
Capt. W. A. M.	5	5	
J. W. M.	5	5	

SECOND TIES.			
Capt. W. A. M.	3	3	
J. W. M.	3	3	

All their shells being exhausted, they agreed to shoot off another time.

LEATHER MEDAL.			
T. S.	3	3	

We have to tender our especial thanks for the handsome manner we were received and entertained by the officers and gentlemen of this true sportsman's association.

—Ira A. Paine, of New York, and Capt. A. H. Bogardus, of Illinois, shot a pigeon match at Woodside Park, Stamford, Conn., on April 27th. The conditions were to shoot at ten birds, twenty-five yards rise, 100 yards boundary, and one and a half ounce of shot, for \$100. Bogardus won, killing ten birds to Paine's five.

PHILADELPHIA, April 23, 1874.

EDITOR *FOREST AND STREAM*:—

Some of the members of the Kensington Hunting Club of Philadelphia had the first pigeon match on April 23, seven birds each man.

The following is the score;

Name.	Score.	Total.
F. Widmayer.	1 1 1 1 0 1 0	5
William Deissroth.	1 1 1 1 1 1 1	7
M. Brierly.	1 1 1 1 1 0 1	6
J. Staiger.	1 0 1 1 1 0 1	5
G. Sonneck.	0 1 1 1 1 0 1	5
J. Magsam.	1 1 1 1 1 1 0	6
Fred. Deissroth.	0 1 1 1 1 1 0	5
G. Schultz.	0 0 0 1 0 1 1	2
E. Steers.	0 0 0 1 1 0 1	3

The match was 21 yards rise and 80 yards boundary.

Yours, FRED. DEISSROTH.

MONTGOMERY, Ala., April 17, 1874.

EDITOR *FOREST AND STREAM*:—

I herewith send you the score of Montgomery Shooting Club at the quarterly match, held on the 13th. Number contestants, 12; 7 birds each; 21 yards rise; 80 yards boundary; high wind, cloudy day. Prizes—first, Club Cup—second prize, value \$10; third prize, value \$5.

Name.	Score.	Total.
H. B. Metcalf.	1 1 1 1 0 1 0	6
Dan Fraser.	1 0 1 1 1 0 0	4
George H. Todd.	1 1 1 1 1 1 0	6
W. D. Brown.	1 0 1 1 1 0 1	5
H. Crommelin.	1 1 1 1 1 1 1	7
Wm. Davidson.	1 1 1 1 0 1 0	5
B. Holt.	1 0 0 1 0 0 0	2
H. C. Davidson.	0 0 1 1 0 1 1	5
T. S. Doron.	1 0 1 1 1 0 1	6
J. G. Crommelin.	0 1 1 1 1 1 1	5
Jas. Caffey.	1 1 1 1 1 0 0	6
Morgan Gilmer.	1 0 1 1 1 1 1	6

Results—H. Crommelin winning the Club Cup, value \$50. The ties on 6 were shot off.

Metcalf.	1 0 1	2
Todd.	1 0 1	2
Crommelin.	0 1 1	2
Gilmer.	1 1 0	2

Second ties were then shot, first miss out, when Metcalf and Crommelin killed their bird. Todd and Gilmer, having missed, were out. Metcalf and Crommelin then shot for choice of prizes, when Metcalf was declared winner of second prize and Crommelin of third prize.

The bird shooting is over for the season, the snipe and plover having nearly all left. There were six snipe killed on Wednesday (14th) by one sport. There has been a scarcity of the migratory birds this winter, especially the water fowl. Usually the Alabama River has been a great resort for mallard, black duck, teal, wood or summer, and bull heads, so called here, but a very dry winter, no water in the ponds, has kept them off. Some of our shots have made quite a good hit during the season. One has over 709 game birds on his list, several others nearly up with him, although the highest number of snipe shot by any one on one day is 34. Yours, &c.,

SEC. M. S. CLUB.

—The visitors in Florida came North like a flock of birds during the warm term in March, but met a cold storm. The weather in Florida in April has been cold, and all who remain are enjoying the amusements and luxuries of the Spring, with abundant room at hotels and upon the boats.

—Sir George Gore, the English sportsman, is at the Grand National Hotel, Jacksonville, on his return from Indian River, where he went with a large retinue of men, 22 dogs, and a vast amount of modern hunting and fishing traps.

—Mr. John S. Beeler, of Hamilton, Ohio, writes to us that he wishes, for the benefit of the fraternity, to add his testimony to that of "R. Y." of Corinth, Miss., in the FOREST AND STREAM of April 16th, in support of Messrs. Clark & Snider's method of altering guns from muzzle to breech-loaders. He says:

"They altered one for me during the past winter and I must say that it gives perfect satisfaction, both as regards appearance and working qualities. I think that sportsmen throughout the country, who have good muzzle-loaders, with which they are familiar, would do well to correspond with Messrs. Clark & Snider before sacrificing their guns, in order to provide themselves with the much prized breech-loaders."

OLNEY, Ill., April 22, 1874.

EDITOR FOREST AND STREAM:—

With pleasure, on behalf of the FOREST AND STREAM Sportsmen's Club of Olney, Illinois, I acknowledge the receipt of a fine portrait of "Belle," also a "Comparative Table of the Close Seasons." Our Club's interest in the protection of game resulted in sending "an amendment" to our present defective laws. Our Club was organized too late to get a bill through this session of the Legislature, but will try to be in season next time. The principal defects are as follows:—

SEC. 1. The penalty is not sufficient to prevent hunters from shooting deer out of season, for it is easy to pay five dollars for a deer if caught with it in possession. Club recommended "not less than twenty-five nor more than fifty dollars."

SEC. 3. Allows game dealers "thirty days" to dispose of game on hand. Club recommended "ten days." For all this time pot-hunters use to smuggle game to unscrupulous dealers. Coming in as they do long before day-light, they sell their ill-gotten spoil and are gone to repeat this until the last of the "thirty days" are past.

SEC. 4. Gives only "one month" for the apprehension of persons who violate the game laws. Club recommends "eighteen months" for this season. Hunters from adjoining States come to Illinois, shoot game out of season, and should they not be apprehended within a month, they are free to repeat the same depredation the following season. This has caused ruinous havoc with our chickens, quail and in fact all game. Hope you will succeed in making a general law for adjoining States.

Yours, &c., G. F. CENTER, M. D.
Secretary F. & S. Club, &c.

—A letter from an old hunter, to whom we gave an order last fall for six live moose to be delivered this spring, is dated Wicklow, N. Brunswick. It says:

DEAR SIR:

"I have to inform you that I cannot get any moose this spring, as we have not had snow deep enough to catch them. It has been a very strange winter, not more than twenty inches of snow on the ground at any one time. I think I never saw a winter before this but what we had three feet of snow on the ground, and generally about four feet—that is, in the wilderness."

LETTER FROM "HOMO."

PHILADELPHIA, April 24, 1874.

EDITOR FOREST AND STREAM:—

Our spring snipe shooting is about at an end; thus far few birds, comparatively speaking, have been killed in the immediate vicinity of Philadelphia, although south of us in New Jersey, Delaware and Maryland they have been unusually plenty and large bags have been made. Our own meadows, as a rule, when the snipe were on in numbers, were too dry and the long-bills fed on the drifts and river flats where the sportsman could not reach them.

As May approaches our lovers of the gentle art are looking to their rods, flies and tackle. I hear of quite a number of sportsmen who intend trying fly fishing for shad on the Delaware River so soon as the run of fish will admit of it. I shall try my Norris rod on the new game and know it will prove as trusty as did Mr. Prime's at Holyoke, providing I am successful in hooking one. I will report *pro* or *con* as to my efforts, although I am fearful the great lengths of nets used from the bay to Bristol and Trenton will prevent many fish from reaching the head of tide water on our river.

I notice in the columns of a contemporary of your journal that they claim to have been the first to suggest field trials in this country. Surely they can not in justice do this when it is known and recorded that you were the first to reprint and publish the English Ipswich Field Trials, and at the same time called the attention of owners of pointers and setters to this interesting out-door sport; furthermore, it is a fact that you were the first and only journal that received the international challenge for field trials from Mr. Price.

We are anxiously awaiting a reply of Mr. Laverack to Dr. Gautier as to the setter question. There is a mistake somewhere and it looks as if Mr. L. was in error.

[It is evident Mr. Laveack is laboring under some misapprehension, as Dr. Gautier, of New York, did purchase a setter of Mr. Laverack in person. See FOREST AND STREAM, April 16th.—Ed.]

DAVENPORT, Iowa, March 27, 1874.

EDITOR FOREST AND STREAM:—

I am now an old hunter near my three score years, yet attached to the wild and exciting scenes of the hunt, as when the young blood coursed through my veins. In the summer of 1864 I came West to enjoy the rod and the gun, and to tramp out the seeds of an inflammatory rheumatism with which I had suffered severely. Suffice it to say that I have had but one slight attack during the last decade, and for the benefit of others in affliction, permit me to add that I never had an attack, except after wearing gum shoes or arctics. I have discarded them, and since, with exercise, have been exempt from the pains and penalties of inflammatory rheumatism. I notice that one of your correspondents has narrated some extraordinary shots. Permit me a similar privilege. Near West-

minister, Md., I once made a shot that surprised even myself. I had a setter standing in a corn-field. The quail rose, and giving me a raking shot, I emptied one barrel of my Greener, when a single bird curved toward me and I dropped it. Retrieving this I sought the product of my first shot and gathered six more as the result. One beautiful afternoon, when the sun was sinking upon the Iowa prairies, I had another extra shot, killing five prairie chickens, or rather pinnated grouse, with two barrels. About thirty yards distant, on the point of my faithful dog, sprang a covey of grouse in the stubble. I fired into the rising cluster and dropped three. A few minutes later I knocked two more with the other barrel. But after all, these were accidents. Give me the shot who kills his single bird, especially the ruffed grouse in the brush and tangled thicket.

On the bluffs below our city I have had some sport in killing this noble game bird, but rarely in paying numbers. They are scarcer here than among the laurels and whortle bushes of the Alleghanies, where I have, in other years, had five birds lying dead before me. Our present winter has been exceedingly open, with no drifting snows to kill off the game birds, and we have the promise of a much larger yield than usual of American quail, ruffed and pinnated grouse. The latter will soon be whirling across our river to their breeding grounds in Iowa, and again we shall hear their music in the warmer days of springtime. Six or eight deer have been killed within ten miles of our city, along the bluff shores of Rock River, and one along the Wapsie—a stream famed for ducking and fishing. Many a splendid day's fishing have I enjoyed on its rich, uncultivated bottom lands, among the mallards and Wilson's snipe. The wild turkey has an occasional representative in this region. They have been plenty in our market, brought here on the Southwestern Railroad from northern Missouri.

I may hereafter give you some notes on the Canada goose, brant, and various wild ducks which, in proper seasons, abound. If you are curious respecting our fishing, I cherish an ardent love for old Sir Isaac, and have explored to my heart's contents the waters where the black bass leap and thrill the fisherman. Rock River, emptying into the Mississippi just below Rock Island, is one of the finest bass streams in the Union.

Yours,

J. H. B.

HAMBURG, Berks Co., Penn.

EDITOR FOREST AND STREAM:—

It seems to have been but yesterday that the old citizens of this county talked of the olden times relating to the adventures on our mountains with Indians, deer, wolves and other wild creatures, which abounded in plenty. Their favorite resort is stated to have been near the Schuylkill River, along the base of the Blue Mountains, near the line of Berks and Schuylkill counties. These two counties are thickly studded with mountains and hills, which were also a favorite resort for the wild creatures which abounded in our State. In the year 18—, one cool morning in autumn, several men (middle aged) might have been seen starting or leaving home, near the lovely village of Hamburg, who, with dogs, guns, &c., presented quite an interesting sight to the general observer, as the entire "rig" was what is termed complete, and all expected to feast for a few days on their return home. They travelled onwards and onwards without getting as much as a glimpse of game. However, on the third day they were agreeably surprised to meet a monstrous rattlesnake, which was game, and after much labor the monster gave up the battle and was soon stretched out, full length, which was ascertained to be nearly six feet. The rattles were taken along as a trophy, not, however, merely as a curiosity, but as a sample piece of their snake-killing propensities. During that entire night was the march continued, and the result was three deer, five wolves and other small game in abundance. The hunting party were unable to carry all their game at once, so they were jogging away in a truly marvelous manner, until a road was reached where they were met by a team, which conveyed the results of their labor to their residences. On their return home they were received with cheers from the motley crowd who had heard of the hunting expedition. But at this present time hunting expeditions are at a discount, as the weary hunter will perambulate the mountains for days without meeting game of any description. If fortune favors, he or they will perhaps be able to secure one or two rabbits, but this is seldom the case. Space is too limited, and we will therefore not continue longer in speaking or writing of the game of Berks county, Penn., but will promise to give the readers of FOREST AND STREAM an essay on the fish and fishing of the county hereafter.

OLIVER D. SCHOCK.

CINCINNATI, April 20, 1874.

EDITOR FOREST AND STREAM:—

I noticed in your last issue a letter from "R. Y." relating to the changing of his muzzle-loader to a breech-loader. He says: "It works admirably, and I sincerely trust that sportsmen in their section of the country, who have good muzzle-loaders and want them altered, will send them to Clark & Snider, for they can make such change without injuring their shooting qualities or adding to the weight of the gun."

Now, the great trouble in changing guns is, that the barrels are not made of metal sufficiently thick. The "hooks" of the muzzle-loader must necessarily be taken out, the barrels cut off and a chamber be bored. Now, if the gun was not of sufficient thickness at the breech, after the chamber had been bored, the gun would be unsafe. In the stock great alteration is necessary. The false breech must be removed, and the hammers on the locks changed, as it is no longer necessary, since the introduction of the breech-loader, that the stock, when loading, must rest on the ground; the heel plate is done away with and replaced by "tips" at the corners of the stock. This requires another removal from the old stock.

Therefore, it is not safe to send any and every gun to be altered, but only those guns which have thick barrels and, as muzzle loaders, fine shooters. To those having such guns, I would say with "R. Y." send them to be altered.

W. L.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo confinis</i> .
Trout, <i>Salmo fontinalis</i> .	Shad, <i>Alosa</i> .
Land-locked Salmon, <i>Salmo gloveri</i> .	
Black Bass	<i>gristes salmoides</i> .
	<i>gristes nigricans</i> .

—Key West turtles have been arriving of late in New York in large quantity. Last week a monster weighing five hundred and sixty pounds, blocked up one of the passages of Fulton Market. Imagine a London Alderman coming across such a treasure. What rapturous ideas of callipash and callipee, that turtle's presence would engender! We should suppose these big fellows were hard to sell. Query: How many gallons of green turtle soup would the large one we have given the weight of, make?

—J. S., a correspondent at Midway, Woodford county, Kentucky, speaks of Point au Pelee, an island in Lake Erie, about twenty-five miles from Sandusky, and just across Uncle Sam's boundary, as a locality that cannot be excelled for its black bass fishing. It is accessible easily from Buffalo and Cleveland. The only objection to the place that the writer mentions is the superabundance of fish. He says a party of six, of whom only one half were anglers, went there last May, and in eight days' fishing, with light rod and reel, took *fifteen hundred pounds* of bass that weighed from two pounds to three and a half pounds apiece, each day's catch ranging from 150 to 200 fish. Often

the music of three or four reels could be heard at once. Hotel accommodation is poor, but the camping ground is superb. Minnows are used for bait, and the bass are not known to take the fly except by trolling. If desired, splendid accommodations can be had at Put-in-Bay, fourteen miles distant, and a steam tug will take you to and from the fishing ground each day. We are rather inclined to recommend this place to the luxurious angler who does not care to rough it in the bush, for superior fishing is rarely found in connection with the comforts of civilization. Moreover, splendid duck shooting can be enjoyed here in the fall, as there are about 5,000 acres of marsh land covered with wild rice, upon which the mallard feed, and any bungler can bag from ten to twenty of an afternoon. There is also fox hunting, if the sportsman will only bring his hounds, for the island is full of red foxes. The best time for an excursion is the middle of the months of May and September. Taken all in all, the Point au Pelee is exceptionally attractive.

—A correspondent, S. S. W., calls attention to the northern portion of Indiana, especially the counties of Noble, Steuben, and Whitley, as containing numerous small lakes, varying from fifty to three hundred acres, which abound in fish and wild ducks. Of fish the principal varieties are the black bass, rock bass, pike, and pickerel. A favorite mode of taking these fish, in vogue among the Hoosiers, is by spearing at night, and the season commences as soon as the lakes are clean of ice, and continues until the "splatter dock" shoots up its long stem and broad leaf from the bottom, to which the fish take refuge from their nocturnal enemy the spearer. Often, as the boat moves noiselessly over the water, huge flocks of ducks start up, frightened by the light in the boat.

—The continued rains and high water have made the black bass fishing in Kentucky much better this season than for several previous years. Generally speaking the angling in Kentucky amounts to nothing, the rivers having been depleted by seining and the erection of dams and locks. The necessity for the establishment of an efficient Protective Society in this State is most apparent, and we trust that the efforts now being made to form one will be in all respects successful.

—One of our corps dropped in at Bradford & Anthony's Fishing Tackle wareroom 186 Washington street, Boston, on the 25th inst., and he was shown some very fine specimens of flies for shad fishing, by Mr. Prouty. A basket of beautiful trout was also shown him which had been sent in from Monument River near Cape Cod, which Mr. Richards of Attleboro had caught the day before. One of them weighed over two pounds, and the fish were in fine table condition.

—Herring fishing has rarely been as successful in England or Scotland as last year. In money the total catch was estimated to be worth £2,000,000. In fish, as near as figures will allow, 400,000,000 of herrings were caught in England, and in Scotland almost 700,000,000 more. The measure used is the *cran*, each cran containing 840 fish. If the herrings weigh four ounces, then each 100,000,000 of fish represents about 25,000 tons of solid food fit for man's consumption. From what this great increase is due, no one can tell. Tremendous, however, as the quantity may be at present, old fishermen, who talk about the herring catch, such as their fathers told them about, declare that they are not as plentiful as they were seventy-five years ago. There is a story told of a miraculous shoal of herrings, which appeared in 1808 off the Coast of Fife. The fish were in such quantity that they stranded. The town crier went through the town proclaiming "caller herrin', forty for a penny." But still the fish swarmed in and the public crier altered his note to "caller herrin' a shilling a cart load." On came the fish until the shores were covered with them, then people were begged to take them for the asking, and it ended by the corporation offering a shilling a load to have them carted away.

—A correspondent at Little Falls, New York, says:—

"An old and valued friend, who has spent the past three summers in the Adirondacks, in July last year killed a brook trout, supposed to be the great grandfather of the species, length 27 inches, weight 9½ lbs. It may be considered rather charming to a man's reputation to talk of a 9½ lb. brook trout, but not more so than "Piseco's" article on "Men with Tails."

This is a trout of unusual size. The largest we ever heard of was one caught at mouth of the Wabanash, Lake Nepigon, which weighed 17 pounds. We have the sworn affidavit to this statement of Henri Le Ronde, the Hudson's Bay factor at Nepigon House.

—A correspondent at Reno, Nevada, of April 20th, says:—

"Tons of trout are being taken now from the Truckee. My neighbor took out a ten pounder. Why don't your fish commissioners send to Lake Tahoe and get a stock for your lakes? I don't know why, do you?"

—The Newburyport Labrador fleet this year will consist of only two vessels. This fishery once employed seventy vessels from Gloucester alone. It is said that the star fish destroy \$200,000 worth of oysters annually in Norwalk Harbor.

Under the influence of the treaty at Washington the fishing fleet at Provincetown has diminished thirty-three per cent.

Messrs. H. & S. Cook & Co., of Provincetown, have leased eligible premises at St. Peters, Breton Island, N. S., for the purpose of pursuing cod fishing from that place, and will move their fishing fleet there.

Thirty-three fishing vessels, all but five or six of those sailing from Boston, have signed the agreement to sell at retail as well as wholesale, in spite of the wholesale dealers' agreement not to purchase from them in case they sell at retail.—*Cape Ann Advertiser*.

—Our valued correspondent Dr. D. C. Estes, reminds us that the season is now open when our readers are casting about for good trouting localities, and sends the following notes from Minnesota:—

"It is a singular fact, that the best, and almost the only trout streams that are direct tributaries of the entire Mississippi River, empty into Lake Pepin. There are ten of these streams, five on either side, from them all I have taken many fine trout. Some of these streams are small but once contained very many fish. A few years rest, and again they are quite plenty. Two of them have been dammed, and the ponds are private property, but anglers are allowed to fish them for a nominal price. There seems to be no end to the number of trout the ponds afford.

Rush River has been and is now perhaps the great trout stream of the north west, if not of the Continent. But here as in other streams the poacher has made sad havoc. In one season over 4,000 fine spotted beauties were taken alive from this river for the purpose of stocking private ponds or preserves; of course many of these died and were thrown away. But the natives have become enraged, and the river is now better protected, but woe to the first fish wagon, or poacher that is caught on the stream hereafter. In consequence of these outrageous depredations the angler is not welcomed as he once was, yet I believe that any gentleman angler will be allowed to take any reasonable number of fish. I have fished this river fifteen years, last season being one of my most successful as far as size was concerned.

Lake Pepin having now become the greatest watering place in the west, as a consequence, very many sportsmen are attracted here every season. It is therefore needless to say that not only the lake but the streams also are tremendously fished.

At Lake City first rate accommodations are afforded, and for reasonable prices. Wm. H. Lyon, a wealthy merchant of your city has built here a fine hotel (the Lyon House,) and other fine buildings. By calling upon him, the sportsmen can get much valuable information, about this region of country, he having more than once enjoyed some of the delights of sporting here. Frontenac, six miles above is fitted up expressly as a place of resort, and is unequalled for its beauty of location, its quiet and its accommodations. It is a young Saratoga in fashion and style. Many sportsmen are found among the guests every season. There are many trout streams in the interior, within a few miles of Lake City. Some of them are mentioned in Hallock's Fishing Tourist. You have fished them, Mr. Editor, and know that they are unequalled for the number and size of the trout they afford. Taking a team at Lake City in the morning you can reach camp on many of these streams in time to catch trout for your supper.

Here every necessary outfit can be had, including the very best rods and other tackle, besides you will find here gentlemen sportsmen, congenial spirits, such as you will be glad to meet, and sorry to part with. They will help you on your way rejoicing, and smoke with you the pipe of peace."

—Mr. C. F. Orvis, rod maker, of Manchester, Vermont, sends us the following item from San Francisco, California:—

"On the 4th of April instant, Mr. John Cammet went out to the mouth of the San Gregorio lagoon, fifty miles south of here, and caught and landed with his light rod you sent us, nine salmon trout weighing seventy-three pounds. The largest weighed nearly ten pounds, and they were all fat and very active fish."

NEW YORK, April 22, 1874.

EDITOR FOREST AND STREAM:—

On the line of the North Shore Railroad of Long Island, about 40 miles from New York, lies the quiet village of Smithtown. It claims to be one of the oldest in the State. For many years past a party of jovial New Yorkers, with Dr. Wood, of Poughkeepsie, have visited this place in the trouting season and been well rewarded in health and amusement. We have four large ponds—Stump, Phillips, Willow, &c., together with a large stream emptying into Smithtown Bay. About a mile from the station lives a popular man to all lovers of piscatorial sport, named Vail. The day before Good Friday, our party being made up, consisting of W. W. S., L. R. J., W. P. T., H. M. W. and myself, we left Thirty-fourth Street Ferry at 4:30 P. M., and at 7 o'clock arrived at the depot, where our eyes were gladdened by the sight of Uncle Aaron waiting for us with his pair of sorrels. We arrived safely, and had our already sharp appetites whetted by visions of a good supper, and Topsy Sable Hebe waiting to pass the claims. What we put ourselves outside of does not particularly concern anybody, and so after song and speech we went bedward. Early next morning we made a few casts and took half a dozen pound trout for breakfast. The weather was so cold our lines often froze in mid-day. During the warm days of summer no pleasanter place than our friend Vail's can be found anywhere. With the thermometer at 90, amid bricks and stone and carts and busy traffic, it is pleasant to steal away to shady brooks and translucent ponds with a fair show of trout in prospect. Here you may fill your basket almost any day, and although we were obliged to remain during Saturday in our lodge, a crackling wood fire and merry companions made the day sufficiently entertaining to be marked with a red letter.

We purpose to try our luck again about the first of May, and if the gods are not against us we will give you a good report.

Anyone wanting a day's "real fun," speaking boy fashion, should make a trip to Vail's in fine weather, and cast a brown hackle in Vail's waters. Many people are unaware how near to their business homes lies the field for recreation and consequent health. J. S. B.

—To the unhappy dwellers along the swollen Mississippi River, the words "*Flood and Field*" have a far different significance now from what they generally convey to the sportsman. Such disaster has seldom swept over so broad an extent of agricultural country since the days of Noah. A territory as large as the State of New York is inundated, the fields are utterly ruined, and the flood has spread devastation everywhere, sparing nothing but the lives of thousands of human beings who are drifting about on rafts or huddled together on knolls and hummocks, shivering and starving, and waiting in vain for the subsidence of the waters. Nobly has Congress and the country rallied to their relief; but crumbs only have been contributed where loaves are needed, for the magnitude of their necessities is appalling, and we trust that those of our readers whose pulses have heretofore bounded with delight at mention of "*Flood and Field*," will feel their sympathies so wrought upon by the painful significance which the words now convey, that they will be induced to extend a generous sympathy to the terribly afflicted people of the Mississippi valley.

The weather continues cold, dismal, and unseasonable—snow all over the country, streams swollen and roily, fish lying perdu, and no successful angling anywhere. We continue our instructions to the angler, and give herewith a chapter on

THE ART OF FLY MAKING—First Cast—To the angler who has leisure and some skill in delicate manipulation, added to a taste for the beautiful in little things, I know of no indoor occupation that is so absorbing as fly tying, and as much of the pleasures of field, forest, and river are in anticipation or recollection, the angler can in some degree while so occupied, follow his favorite sport when debarred by the weather, or otherwise, from haunting the banks of the stream. No writer, from Cotton in his stone cottage on the banks of the Dove, displaying the niceties of the art to his pupil, our father Izaak, down to the renowned Blacker, has as lucidly described it as a reader could wish, and an hour or two for three or four consecutive days with a fly maker, at work, is of more value to the beginner than all the written directions that can be indited. But to those who have no such privilege, or books on the subject, and who do not know exactly the materials to be used, or how to procure them, a paper on the subject may be of great assistance.

If the learner's fingers are delicate and he has good use of them, it is better to dispense with some of the mechanical appliances used; but for one whose digits are clumsy or who lacks a free use of them, I would recommend the two simple little instruments drawn to actual size below. The vise, of course, is for holding the hook; the smaller tool is

a spring pincer, or as some term it a pair of pliers, for holding the end of a thread or hackle, and conveniently used for wrapping the latter on the hook.

Materials.—These of course, in quantity and variety, will depend much on the angler's wants as to the different flies—few or many—he may wish to produce. A country boy will go to his mother's hen roost and get all the feathers he wants, and by making a slight raid on his sister's work basket for silk and worsted, construct a very effective fly, rough and unkempt though it be to look at. But the angler who is ambitious must necessarily have the bump of acquisitiveness well developed; I will therefore mention nearly all that I use myself, and in the order in which they are applied to the hook.

WRAPPING SILK.—The finer, if strong, the better; and although the color should in some degree correspond to the other material used, this is not of much consequence, as it is only seen in the few slight wrappings at the head of the fly.

Wax.—Do not use "cobbler's" wax, as some English writers on this subject call it, but beg or make a little expressly for the purpose. It is the simplest thing imaginable, although much mystery is attached to it by many fly makers, and the compounds and manner of making their wax are held as inviolate secrets. Take one ounce of the clearest and lightest rosin you can procure, one drachm of gutta percha, and one teaspoonful of linseed oil—the crude, not the boiled—put them in a teacup (I use the lower part of a discarded tin blacking box), heat them, stirring with a little stick the meanwhile, to have them thoroughly amalgamated, and then pour the hot compound into a bowl of cold water. As soon as it has cooled sufficiently, work and pull it, much as girls pull "taffy;" this makes it light colored and tough. If the gutta percha cannot be easily obtained it may be omitted, but it adds to the toughness. To make the wax softer for cold weather, add a few drops of oil. To make it harder for warm weather, add, as you require, a little more rosin.

Hooks.—There is much difference of opinion as to their proper shape for flies. The last one is Pennell's hook, as illustrated in his book. Andrew Clerk swears by the Kinsey, while Conroy declares for the O'Shaughnessy; i. e., the improved Limerick. I coincide with Conroy. The point of the barb of the O'Shaughnessy has an outward projection. It is what is called a hollow point, and the chances of hooking the fish are thereby increased. The point of the Kinsey projects inward away from the line of draft, and therefore less liable to catch than the Sneekbend, the Aberdeen, or the old Kendal. Conroy imports the improved Limerick for me to order, of lighter wire—from No. 6 to No. 12—than those he has for general sale, which I think are too stout, and rather clumsy. The Kirby, the hooking quality of which is superior to all others, if short shanked, may be used for palmers and hackles, but for winged flies the sideward inclination of the point would give the wings of the fly "a list" to one side, and prevent its floating on an "even keel."

Gut.—Should be fine for stretcher, and stout for drop flies; for the latter using a half length. If the droppers are intended to be looped to the leader, the loops should be tied in each end of the length after soaking the gut, the projecting end pulled tight and cut off close, and then the length divided into two. For my own use, and for my customers, I prefer gut dyed a neutral tint, which is between a blue and lead color. It is done as follows:—Throw your hank of gut into a basin of cold water, and while it is soaking put into a small vessel—tin will answer—a pint and a half of water with one drachm of ground logwood and six grains of copperas. After it has commenced boiling let it bubble for ten minutes longer; then, dashing the water from the gut, throw it in, and press it down with a small stick. In thirty seconds or so lift it to see the depth of tint, and continue to examine and immerse it until it suits your fancy. A light tint I consider preferable. Some persons think that the dye affects the strength of the gut. This is not the case, unless there is too much copperas; much more than I have prescribed.

Tinsel.—Gold or silver, as it is called, but really "Dutch metal," whether round or flat, is kept by variety or military stores, or the country reader can obtain the flat from some dealer in Irish linens, as it is frequently used, ornamentally, in putting them up.

Dubbing.—The materials, and they are many, of which the bodies of flies are wrapped are, first, and most important, peacock herl, or "harl," as some persons call it—the little plumelets or fibres growing on each side of the tail feathers of the peacock. The copper colored, for nine flies out of ten, is preferable; the green is used for fancy flies. The next is mohair, or the ravellings of a fabric called "mohair," or pig's wool, growing on certain parts of the animal beneath the bristles, or seal's wool, the most brilliant of all—all of which can be dyed of many colors; or the fur of a rabbit, squirrel, monkey, or other animal. Add to these wrapping floss silk, and the list, I believe, is complete.

Hackles.—The hackle is intended to represent the legs of a winged fly, or without the wings some imaginary caterpillar insect, which trout take for a reality. There are saddle and neck hackles. The former are the long streamers growing on each side of a cock's rump, the latter are plucked from the back of the neck—the closer to the head the shorter the hackles and stiffer the fibres. Having stouter stems than the saddle hackles, they are less apt to break in winding on. The older the cock the stiffer the fibres; but as old cocks are not always obtainable I avail myself of the good terms I am on with several poultry-dealers to pluck the heads and necks of their capons. Natural hackles are more generally used in tying trout flies than others. Then there are those, the fibres of which are red at the stem, or say at the roots, and black on the outer edges of the feather, and frequently black at the stem and red at the outer edges; both of which are called furnace hackles. There are also light yellowish red, termed "ginger hackles." Black hackles are essential in tying dark flies. Gray are used in tying dun colored flies when dun hackles, which are very scarce, are not to be had. Add to these the ginger barred and black barred on a white ground, and we have most of the natural or undyed colors. But hold, there are a few more, the feathers from the wren's tail, from the ruff of the grouse, from the partridge and snipe, and the short spotted feathers of the guinea fowl are occasionally used, but they are soft of fibre and poor substitutes for cock's hackles.

It is my intention to add a supplement on salmon flies to this series of papers when I will describe the manner of dyeing wing feathers, hackles and dubbing.

Wings.—The feathers of which the wings of flies are made, are numerous. Those of the mallard, teal, redneck, shell drake, wood duck, and other wild fowl correspond in position to the saddle hackles of the cock, and are, I think, what ornithologists term "tail coverts." Few others, except the secondary wing feathers of the red neck, canvas back and teal are used. The tail coverts of ducks are difficult of manipulation on account of their extreme delicacy and lightness. Of all feathers from the wings of birds or domestic fowls the secondary only are good; the pinions are worthless. If a man's arms were wings the pinions would be found growing from the wrist to the tips of the fingers, the secondaries from the elbow to the wrist. I hope this will explain their true position, for if one asks his friend in the "rural districts" to get him the feathers of a certain fowl, in nine cases out of ten he will be presented with any other than the right ones. The great variety of plumage in domestic fowls, produced by crossing and interbreeding has furnished some invaluable feathers to the fly-maker, especially to the beginner; these are in nearly every case the secondaries of hens. They are much easier of manipulation than the tail coverts of wild ducks or the short fibred wing feathers of birds, and in all cases should be used instead by the tyro when he can get them near the shade or markings of any duck's feathers he may admire. The Earl Derby, the dark brahmas, and most of the various crossings producing so many shades of brown and mixed colors furnish them. White secondaries are used for the wings of the moth fly or white miller, as also for the Coachman. Dun feathers are almost as difficult to procure as dun hackles. When one is fortunate enough, therefore, to obtain them in excess of his own wants he should garner them up for the needy; for fly-makers are great beggars. Red ibis of course will be seized on, as well as the crest, ruff back and breast feathers of the golden pheasant. Turkey, the secondary and tertiary, as well as the tail feathers, also come into play; so also do some of the wing feathers of the wild goose. English blue jay, maccaw and parrot, and golden pheasant are used almost entirely in tying salmon flies. I had almost forgotten to include guinea hen, and am quite confident that I shall remember on reading this, my "first cast," in print, of having omitted others. In our next cast, we will get to work and try to show how to use the materials we have described.

—The American Museum of Natural History at the Central Park, in order to defray the usual current expenses, propose electing a certain number of annual members, who, on the payment of \$10, will be entitled to admittance to all receptions given by the Museum, and with a season ticket and ten tickets of single admission. Mondays and Tuesdays of each week are the days reserved for subscribers and students. Since the 1st of January many new names have been sent in, and it is believed that during 1874 as much as \$25,000 will be added to the funds of the Museum. All surplus amounts, after defraying expenses, will go to purchase new collections.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

HIGH WATER, FOR THE WEEK.

DATE.	BOSTON.	NEW YORK.	CHARLST'N
	h. m.	h. m.	h. m.
April 30	10 43	7 27	6 43
May 1	11 19	8 1	7 19
May 2	11 53	8 39	7 53
May 3	eve 35	9 21	8 35
May 4	1 17	10 3	9 17
May 5	2 2	10 47	10 2
May 6	3 34	11 38	10 54

—The yacht *Addie V.*, which Mr. Langley paid \$7,000, for when he purchased it, and which cost him some \$3,000 for improvements about two years ago, was sold to Messrs. Roosevelt for \$2,500, the greatest bargain in yacht selling of the season.

—The Harlem Rowing Association will manage the regattas, which will take place as usual in June on the Harlem River, but as yet nothing has been settled as to crews.

—Mr. F. Burritt is having a center board schooner yacht built in South Norwalk, Conn., at Mr. Richard's yard. She will be 85 feet over all, 76 feet keel, 22 feet beam, 6½ feet deep. She is to be called the *Estelle*, and will probably be launched about the first of June.

—Mr. Ward, of New York, is having a yacht built from a model of Messrs. J. Fish & Town. She will be about forty-five feet long, a keel boat, and will measure in the neighborhood of twenty-five tons. Mr. Ward expects to go to England in her as soon as she is finished, and has very wisely adopted the English cutter rig.

—Messrs. J. Fish & Town are building a small sloop about twenty-eight feet in length, which, we believe, is to be the property of a member of the Eastern Yacht Club.

—The owners of fast vessels, belonging to the New York Yacht Club, will have an excellent opportunity to add to the contents of their plate locker this season, for besides the prizes for the regular annual regatta, Commodore Bennett offers five season cups, four of them valued at \$500 each, and the other at \$1,000. Of the smaller cups, one for schooners and one for sloops, will be sailed for during the summer cruise, and the two remaining of this size, one of which is intended for schooners, one for sloops, will be the prizes for the October regatta. The \$1,000 cup is destined for the successful schooner in race from Sandy Hook to Cape May and return.

As the *Madgie*, the last possessor of the "Club Course Challenge Cup," has been sold out of the club, this cup comes back again to be sailed for by the fleet and may possibly be an additional inducement for entries for the regular annual regatta on June 11th. This cup has to be held through three consecutive races before it is absolutely won, however.

When the *Rambler* was sold and went east the cup which she had twice won in contest with the *Madeline*, was given to the club. It is known as the "Brenton's Reef Challenge Cup" and the course to be sailed is from Sandy Hook to Brenton's Reef Light, off Newport, and return; or, starting from Brenton's Reef to Sandy Hook and back—keeping to the South of Long Island each way.

—News comes from the other side that the *Enchantress*, Mr. Loubat, which is at Cowes, has been hauled off the mud and has had her spars taken out prior to having extensive alterations made in her by Mr. John White, under the personal superintendence of Mr. Robert Fish.

—The schooner yacht *Faustine*, built last season for Mr. Peabody Russell by Herreshoff, is also at Cowes. During the winter she has had her keel deepened considerably and is now being put in thorough racing trim. It is believed that she intends to test the speed of the schooners *Egeria* and *Pantomine*, which are not far from her in point of size.

—The schooner yacht *Madgie*, formerly the property of Ex-Commodore Loper, is now in the West Indies, and is used by her present owners as a freight and passenger vessel running between some of the islands.

—The yacht "Vindex," Capt. Robert Center, of the New York Yacht Club, from Savannah to New York, arrived at Norfolk, Va., on the 27th inst.

BOSTON, April 25, 1874.

EDITOR FOREST AND STREAM:—

Preparations for the coming season are now being made in the Dorchester yacht club. Some of the boats are already afloat and others are being overhauled. The "Fearless," Capt. Woodward, is being fitted with lead ballast and undergoing other improvements, which it is hoped will make her out sail her previous record, good as it is.

The "Ruby," Capt. Preston, is to have her stick lengthened, or rather a new one is to be put in and the new sail is to travel on a railroad. The "Fearless" and "Ruby" are competitors, and the improvements in each would seem to imply that each captain intends to make his boat the faster. Commodore Bangs has disposed of his sloop yacht "Jennie," and purchased an interest in the "Wivern."

Capt. Halsall has sold his sloop yacht "Owl," and will not probably own a boat this year as he contemplates a trip to Europe.

The "Firefly," Captain Balch, is in the hands of Pierce Bros., and will go into commission early in May.

The Dorchester Club have invited the Boston Yacht Club to join in a union regatta to take place May 22d at South Boston, and the invitation has been accepted.

The "Clytie," Capt. Meredith, has been withdrawn from the club.

The annual cruise of the club will probably take place the latter part of July or the first of August, but no formal announcement has yet been made.

This year the small boats of the fourth and third class centre boards are to be restricted to the use of working sails only, in regattas. A strong effort has been made to allow shifting ballast in these classes, but thus far without success, the idea being to encourage the production of good sea boats and not mere racing machines. BINNACLE.

SOUTH BOSTON YACHT CLUB.—The regatta committee of this club have the past week decided to hold the regattas mentioned in our last issue on the following days:

Opening regatta to be Thursday, June 4th, for which the flying start has been adopted, the prizes to be silver ware.

The championship regattas are to be held June 18th, July 17th and August 1st.

The Union Regatta, open to all clubs, will be held September 2d.

The courses adopted by the committee are as follows:

FIRST CLASS.—Course No. 1.—From Judges' Boat to Buoy No. 6, Dorchester Bay (Cow Pasture Bar), leaving it on the port, to Buoy No. 7, off Fort Independence, leaving it on the starboard, Spectacle Island and Sculpin Lodge Buoy on the port, to Buoy No. 6, Lower Middle, leaving it on the port, passing between the Judges' Boat and Flag Boat.

COURSE No. 2.—From Judges' Boat to Buoy No. 6, Dorchester Bay, leaving it on the port, to Buoy No. 6, Lower Middle, leaving it on the port, thence to Buoy No. 9, and leaving it on the port, passing between Fort Independence and City Point, and Judges' Boat and Flag Boat.

COURSE No. 3.—From Judges' Boat to Buoy No. 6, Lower Middle, leaving it on the starboard, to Buoy 6, Dorchester Bay, leaving it on the starboard, to Red Spar Buoy, off K street, leaving it on the starboard passing between Judges' Boat and Flag Boat.

SECOND CLASS.—Course No. 1.—From Judges' Boat, up Old Harbor Bay, leaving Red Spar Buoy, off K street, on the port, to Buoy No. 1, off Thompson's Island, leaving it on the port, to Buoy No. 7, off Fort Independence, leaving it on the port, passing between Judges' Boat and Flag Boat, and repeat the same course.

COURSE No. 2.—From Judges' Boat, leaving Buoy No. 6, Dorchester Bay, Thompson's Island and Sculpin Lodge Buoy on the port, Spectacle Island on the starboard, to Judges' Boat, passing between it and Flag Boat.

COURSE No. 3.—Once around Course No. 1.

The Judges appointed for the year are Messrs. Thomas Christian, J. G. Chambers, P. P. McDonald, E. W. W. Hawes and A. K. Roberts.

—Notwithstanding the inclemency of the weather last week the following yachts were added to the nucleus of a fleet already afloat at City Point, South Boston: Commodore J. N. Roberts' schooner yacht "Mercury," R. D. Tucker's sloop yacht "Coming," which Capt. Bent will command as in former seasons, W. J. Orcutt's schooner yacht "Banshee," S. J. Capens sloop yacht "Kelpie," also the yacht "Ella," the sloop yacht "Spark" and a number of smaller boats.

The schooner yacht "Surprise," Capt. John Quinn, has established a mooring outside the fleet. She is about 50 tons capacity, and is unsurpassed as a party boat, for which she is used.

—In the last issue of this journal, under our yachting news, we stated that the length of yacht requisite to entitle the owner to membership in Eastern Club (Mass.) is 19 ft. 6 in. It should have read 26 ft. 6 in.

—It is reported that Capt. James Read, a Boston pilot will command General Butler's yacht, the famous "America," the coming season.

—The Philadelphia yacht club held their annual meeting at the house of Albert Ebener, where the following gentlemen were elected to serve as officers for the ensuing year: President, Charles Bates; Secretary, Charles Sheppard. The regatta will take place May 18th, and ninety boats have entered.

THE CORINTHIAN CUP.

NEW YORK, April 18, 1874.

EDITOR FOREST AND STREAM:—

The Seawanhaka Yacht Club proposes to offer a silver prize of the value of \$500, to be sailed for at Newport in the latter part of August next, by such schooner yachts of the recognized yacht clubs in the United States as may desire to compete. The race will be conducted according to the Corinthian system. In other words, each yacht must be sailed and, as far as possible, steered by her owner and manned exclusively by amateur members of the club under whose flag she is entered for the race. This system of yacht racing has been for some years successfully practiced in England, and has been found by English clubs to conduce materially to the development of practical seamanship among yacht owners, while it has enhanced the pleasure of their non-yacht owning members, and awakened in them a warmer feeling for their respective clubs.

The Seawanhaka Yacht Club was, we believe, the first to introduce the system in American waters by a successful regatta for sloops, sailed last fall at Oyster Bay, Long Island.

The present action of the club is taken with a view to bring the Corinthian system before the owners of schooner yachts in the various clubs, there being no reason to doubt that the owners of larger vessels are possessed of sufficient knowledge and ability to sail them with a skill and judgment equal to that displayed by the owners of sloop yachts in the handling of their smaller craft. It is also the opinion of the club that to obtain amateur crews capable of executing intelligently the orders of their captains would be much less difficult than is generally supposed.

Newport has been selected as a pleasant and easily accessible rendezvous, and the latter part of August as a time when a large number of yachts are cruising in that vicinity. The race will be sailed according to the sailing regulations of the Seawanhaka Yacht Club, which are substantially the same as those of the principal clubs.

The time allowance will be calculated upon the basis of mean length and greatest breadth. The sails to be carried will be restricted to the mainsail, foresail, jib and flying-jib (or fore-staysail, jib and flying-jib), and working fore and main gaff top-sails. Each yacht may carry a local pilot or its regular sailing master, to act solely as pilot, but if in case of an emergency the owner should surrender the control of his vessel to either of these persons he shall be deemed, by so doing, to have abandoned the race.

The owner of each competing yacht will be required, upon the day previous to the race, to submit a list of his proposed racing crew to the Regatta Committee, who shall have the absolute right to exclude from such crew any person who may be considered to be "a professional."

Each yacht will be allowed to carry (exclusive of the owner, and sailing master or pilot) one man for every five feet in length on deck and fractional part thereof.

Unless the definite entry of at least five yachts is received prior to July 1, the whole project will be abandoned.

Commodore Bennett, of the New York Yacht Club; Commodore Forbes, of the Eastern Yacht Club, and Commodore Swan, of the Seawanhaka Yacht Club, have consented to act as judges.

The above are the principal features of the proposed race, but full information in regard to details will be furnished by the secretary, Mr. Frederic Foster, No. 65 Wall street, N. Y., to all owners of yachts desiring it. Prominent yachtsmen have expressed themselves as heartily in sympathy with the scheme. We hope that it will enlist your support and co-operation, and that you will enter your yacht for the race. An early answer is requested.

Yours respectfully,

WILLIAM L. SWAN,
J. WM. BEEKMAN, JR.,
SAMUEL J. COLGATE,
WILLIAM FOULKE, JR.,
M. ROOSEVELT SCHUYLER
FREDERIC DEP. FOSTER, } Committee.

To _____,
of Yacht _____.

BOSTON, April 23, 1874.

EDITOR FOREST AND STREAM:—

I enclose a short item of yachting intelligence for your next issue, if agreeable to you:

The Regatta Committee of the South Boston Club held a meeting last night (April 24), and it was arranged that regattas would take place as follows: Opening regatta with a flying start, June 4; championship regattas will come off on June 18, July 14 and August 1; Union regatta, open to all clubs, Sept. 2. The yachts are divided into first and second class keel, and first and second class centre-boards. Two prizes will be offered for each class, and silver ware has been chosen for the opening race.

A special meeting of Dorchester Yacht Club was held at Commercial Point last evening (April 24), Commodore W. H. Bangs, Jr., in the chair. J. J. Baker, J. V. Mills, Jr., A. J. Lewis, F. T. Morton, W. D. Hodges and J. N. Roberts were elected members. An invitation has been extended to the Boston Yacht Club by Commodore Bangs to join them in the opening regatta at City Point, on May 21, and has been accepted.

The Boston Club appointed a committee to confer with the Dorchester Club committee on the arrangements, and it was decided to offer a prize for schooners over 40 feet long, in addition to the other prizes. A motion was made by Mr. Walter Burgess to restrict all centre-board, cat-rigged yachts of the fourth class to mainsail only in races, and sloops to mainsail and jib, which was carried, but a motion to restrict all yachts to working sails was lost. Messrs. Lewis, Sayward and Barnard were appointed a committee to consider the subject of a change of uniform for the club. A motion was made to appoint a committee to confer with other clubs as to the advisability of preparing a yachtsmen's chart of Boston Harbor, but was lost, as was a resolution to annul the fifth rule, prohibiting the shifting of ballast on the day of ordering a race. After some small change in the constitution of the club the meeting adjourned.

D. H. EATON.

—The fall regatta of the Saratoga Rowing Association will take place as usual, notwithstanding the fact that the college oarsmen will enjoy the hospitality of the association in July. It will occur during the last week of August, however, instead of the first week in September as formerly.

Mr. Frank Leslie has offered a challenge cup, valued at \$1,000, to be known as the Interlaken Cup, named in honor of his country seat on Saratoga Lake, which has been accepted by the association and will probably be the prize for the pair-oared-race. In addition to this will be a prize for single scull oarsmen belonging to this State, which is to be considered as a State Championship Badge, and the regular Challenge Cup, both offered by the Saratoga Rowing Association. The programme will be divided into three days. The first day will be given to the single scull race for the State championship and the double scull race; the second day will include the general single scull race and the pair-oared race; the third day will be devoted to the Junior single scull and the great four-oared races. Yale College will send four-oared and pair-oared crews. It is already certain that the following clubs will be represented in one or more of these races:—Beaverwick Rowing club and Mutual Boat club, Albany, N. Y.; Columbia Boat club, Brooklyn, N. Y.; Buffalo Rowing club, Buffalo, N. Y.; Sawanhaka Boat club, Greenpoint, Long Island; Atlanta, Dauntless, Friendship, Gramercy and Nassau Boat clubs, New York, and New York Athletic club; Riverside Rowing club, of Rochester, N. Y.; Saratoga Rowing Association, Saratoga Springs, N. Y.; Union Springs Rowing club, Union Springs, N. Y.; Vesper Rowing Association, Yonkers, N. Y.; Argonauta Rowing Association, Bergen Point, N. J.; Atlantic Boat club, Hoboken, N. J.; Oneida Boat club, Jersey City, N. J.; Woodside Rowing club, Woodside, N. J.; Potomac Rowing club, of Georgetown, D. C.; Anulostan Boat club, of Washington, D. C.; Yale University, New Haven—a pair and a four-oared; Couper Boat club, Savannah, Ga.; Pelican Boat club, of New Orleans, La.; Gleam Boat club, of Bath, Me.; Grand Haven Boat club, of Grand Haven, Mich.; Wah-Wah-Sum Boat club, of Saginaw, Mich.; Excelsior Boat club, of Detroit, Mich. Pupe Barge club, of Cincinnati, Ohio; Undine Boat club of Toledo, Ohio, four-oared race, with a coxswain; Duquesne Boat club, of Allegheny, Pa.; Vesper Boat club, of Philadelphia; Argonaut Rowing club, of Toronto.

WILLIAMS COLLEGE,
WILLIAMSTOWN, Mass., April 24, 1874. }

EDITOR FOREST AND STREAM:—

Our college fleet is but a small one, comprising at present 1 barge, 47 ft. long and 19 inches wide, 1 cedar shell, 51 ft. long and 22 inches wide, and one pair oar. There is a prospect of one more shell being added. During last summer vacation the town rowdies utterly destroyed one boat for us, and injured another, so that we were obliged to cut her in two; the parts we use in various ways. Our practice course is a mile distant from town. It is one mile in length, with two acute angles and one lesser angle, and not wide enough for boats to pass each other conveniently. Yours truly,

WILL.

—C. M. D.'s (Halifax) canoe article, No. 2, in our next with illustrations.

PRIZE LIST.

FOREST AND STREAM

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.

It is the OFFICIAL ORGAN of the

FISH CULTURISTS' ASSOCIATION
OF AMERICA.

In order to stimulate the development of

MANLY and ATHLETIC EXERCISES,
AS OFFISHING, SHOOTING, ARCHERY, CRICKET,
FOOTBALL, and CROQUET,Offer the following prizes for clubs of three or more
Single Subscription per Annum \$3

Starting Clubs.—Agents, and others interested, are advised that we do not insist upon their starting with full clubs to secure our rates. They can send three or more at a time, and on forwarding the requisite number within 60 days will be entitled to same premiums as if all were sent together.

CRICKET.

For \$20 00 four copies, one year, with one best spring bat, one College bat, one Dark cricket ball; price \$7 50.

For \$25 00, five copies, one year, with a complete cricket set; one College bat, one polished bat, Clapshaw; one Dark cricket ball; one set of stumps; price \$12 00.

FOOTBALL.

For \$15 00, three copies, one year, with one Rugby football; price \$6 00.

FISHING RODS.

For \$15 00, three copies, one year, with one superior four joint light rod, suitable for all kinds of fishing; price \$7 00.

For \$60 00, twelve copies, one elegant rod; suitable for trout, black bass with fly, or for trolling bass or pickerel; as fine a rod as can be made; German silver tipped, with three tips; price \$25 00.

CROQUET.

For \$20 00, four copies, one year, with very handsome set of croquet; price \$7 00.

For \$25 00, five copies, one year, with superb set of croquet; price \$10 00.

For \$30 00, six copies, one year, with the finest set of croquet made; price \$14 00.

REMINGTON RIFLE AND SHOT GUN.

For \$75 00, fifteen copies, one year, with one Remington Deer rifle; price \$28 00.

For \$100, twenty copies, one year, with one Target rifle, 30-inch octagonal barrel, to be used for sporting, hunting, or target shooting; price \$36 00.

For \$100, twenty copies, one year, with one Remington double barreled, breech-loading shot-gun, one of the best guns ever offered to American sportsmen; price \$45 00.

SHARPE RIFLE.

For \$107, twenty copies, one year, with one Sharpe sporting or target rifle, best quality; price \$40 00.

WARD-BURTON RIFLE.

For \$200, forty copies, one year, with one Ward-Burton rifle magazine gun for large game, price \$0 00.

SINGLE AND DOUBLE BARREL MUZZLE LOADING SHOT GUNS.

For \$20 00, four copies, one year, with one American single barrel gun, perfectly safe, blue barrels, walnut; price \$10 00.

For \$35 00, seven copies, one year, with one American double gun, handy and reliable gun every way; price \$18 00.

For \$50 00, ten copies, one year, with one double boys' fine twist barrel gun, a safe gun every way for boys; price \$26 00.

For \$75 00, fifteen copies, one year, with double gun, English laminated steel barrels, handsome finish; price \$45 00.

CASH PREMIUMS.

To those who prefer cash premiums a discount of 25 per cent. will be made on all clubs of three and upwards.

Every article is of the finest quality and will be sent free of expense.

Remitting Money.—Checks on New York City banks and bankers are best for large sums; make payable to the order of FOREST AND STREAM PUBLISHING COMPANY, 103 FULTON STREET, NEW YORK. Post Office Money Orders for \$50 or less are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.

Send the names with the money as fast as obtained, that subscribers may get the paper at once.

LA CHASSE ILLUSTREE, a Weekly Journal, is about the same size as the Forest and Stream, and contains information regarding European hunting, fishing, and accounts of travel from all parts of the world. It is the highest authority in regard to pisciculture. It is profusely illustrated by the first artists, and is the only Journal published in France devoted to the interests of the Sportsman. The yearly volumes make a magnificent work of 600 pages, adorned with 200 original designs.

La Chasse Illustree.

Miscellaneous.

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes especially are recommended to owners of fine breech-loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 6½ lbs. each, and in canisters of 1 and 5 lbs.

AUDUBON POWDER,

Very quick. For woodcock and quail Nos. 1 to 4. Packed in metal kegs of 12½ lbs. and 6½ lbs., and in pound canisters.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes. Sizes F.g., F.F.g., F.F.F.g., the last being the finest and most used. Packed in wood and metal kegs of 25 lbs., 12½ lbs., and 6½ lbs., and in canisters of 1 lb. and ½ pound.

All of the above give high velocities and less residuum than any other brands made.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skulls, two pounds of "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

GOODS SENT BY EXPRESS, C. O. D.
Apr 16 PECK & SNYDER, 126 Nassau St, N. Y.

This arm was submitted in competition with over one hundred different systems, American and Euro- pean, to the Board of United States Officers, appoint- ed by Act of Congress, 6th June, 1872, for the pur- pose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It suc- cessfully passed through all the tests.
The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will re- quire its adoption."
Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the con- ditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordnance Report.)
We are now making these guns to supply the nu- merous demands, and will soon have them in the market.
The following is our scale of prices: Special Maga- zine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and up- ward. Magazine guns for general use, carrying 3 to 9 cartridges, 60 grs. powder, 350 grs. lead from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder; 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be 45-100. in.

JUST PUBLISHED.
HISTORY OF NORTH AMERICAN BIRDS. By Prof. Baird, Dr. Brewer and Mr. Ridgway. Three volumes..... 30 00
FIELD ORNITHOLOGY. A Standard Treatise on Taxidermy, with Check List of North Amer- ican Birds. Check List alone E. Coues... } 75
By remitting the exact amount any of the above works will be forwarded by mail.

Forest and Stream Publishing Co.,
NO. 17 CHATHAM ST., NEW YORK,
AND 125 S. THIRD ST., PHILA.

New Work by Dr. Coues.
Field Ornithology.

A complete treatise on collecting birds and prepar- ing them for the cabinet. Covers the whole ground thoroughly, enabling the tyro to become an expert Taxidermist. This is the
Standard Treatise on Taxidermy.

IT ALSO INCLUDES A
Check List of North American Birds,
Classified and named according to the
Key to N. American Birds.

Manual of Instruction and Check List together beautifully bound in fine cloth, \$2.50.
Check List alone, pamphlet, printed to cut up for labeling specimens, and for recording field observa- tions, 75 cents.

NATURALISTS' AGENCY,
and booksellers generally. Salem, Mass.

SALMON ANGLING.

APPLICATIONS will be received for the privilege of ANGLING for SALMON (fly-fishing) in the FLUVIAL DIVISION of any of the undermen- tioned RIVERS. LEASES will be issued, or LEASES granted for five years, as may be agreed upon with each applicant. Upset prices are named below, above which snms competition will take place. Guardianship at private cost forms part of conditions.

Schedule of Vacant Salmon Rivers.

Names.	Locality and Description.	Upset Price.
N. COAST OF ST. LAWRENCE		
Portneuf.....	40 miles below Tadousac. In course of re-stocking...	50
Trinity.....	15 miles below Godbout. Salmon and Sea Trout stream, capable of afford- ing sport.....	100
Little Trinity.....	Small and indifferent.....	20
Calumet.....	15 miles below Trinity Ri- ver. Small and indiffer- ent.....	30
St. Margaret.....	36 miles above Moisie. Good Salmon and Sea Trout stream.....	100
Tront.....	7 miles below Moisie. Pro- mising stream. Untried..	100
Mistassini.....	Small and indifferent.....	20
Becscie.....	15 miles west of Godbout. Small and indifferen.....	20
Magpie.....	5 miles west of St. John Ri- ver. One tidal pool for angling. Untried.....	50
Minga.....	Excellent Salmon stream. Accommodates four r.ds.	500
Manito.....	Branch of above. Only 1 rod	
Romaine.....	9 miles below Mingan. Es- tuary limits included.....	400
and Little	Excellent Salmon River. Takes four rods	
Romaine.....	Branch of above. Fine an'lg	
Agwanus.....	8 miles above Natashquan. Small and indifferent.....	20
Kegashca.....	10 miles below Natashquan. Small and indifferent	20
La Romaine.....	15 miles below Natashquan. Untried.....	20
Mecatina.....	Salmon stream, 60 miles be- low Natashquan. Untried	40
St. Augustine.....	40 miles west of Esquimaux River. Untried.....	50
Esquimaux.....	Large Salmon stream. Un- tried.....	200
GASPE AND BAY DES CHAL EURS.		
Malbay.....	Near Perce. In course of restocking.....	100
Grand Pabos.....	About 20 miles from Perce	200
Little do.....	Good Salmon streams.....	100
	Fair fishing.	
G. Cascapedia.....	Superior angling stream....	500
L. Casapedia.....	Good Salmon stream, adjoin- ing Grand Cascapedia....	200
Jacquet.....	8 miles below Dalhousie on south side of Bay des Chal- leurs; small stream.....	100
Charlo.....	4 miles below Dalhousie; small stream.....	100
Tobique.....	4 miles below Grand Falls, St. John River; salmon plentiful; large river.....	100
ISLAND OF ANTICOSTI.		
Jupiter.....	Large Salmon stream. Un- tried.....	100
Salmon.....	Large Salmon stream. Un- tried.....	50
Chicote.....	Small stream. Untried....	20
Becscie.....	do do.....	20
Pavillion.....	do do.....	20
Otter.....	do do.....	20
Chaloupe.....	do do.....	20

By order of the Hon. Minister of Marine and Fish- eries.

ADDRESS:
W. F. WHITCHER,
Commissioner of Fisheries,
Ottawa.

*Apr 9-6t

We offer to dealers and sportsmen a most complete assortment of

Fishing Tackle
Rods, Reels, Lines, Artificial Flies, Nets,
Baits, Fish Hooks, Etc.

Split Bamboo Fly Rods and Reels

OF THE FINEST WORKMANSHIP.
Tackle suitable for Maine, Adirondack, Canadian and other fishing.

ARTIFICIAL FLIES DRESSED TO ORDER.
BREECH AND MUZZLE LOADING GUNS,
And sportsmens' goods of all kinds

Manufactured and Imported by

BARTON, ALEXANDER & WALLER,
101 & 103 DUANE ST., (near
Broadway) New York.

Terms, Five Dollars a Year. {
Ten Cents a Copy. }

NEW YORK, THURSDAY, MAY 7, 1874.

{ Volume 2, Number 13.
17 Chatham St. (CityHall Sqr.) }

For Forest and Stream.

THE FO'KS'LE--A REVELATION.

IN the dark and grimy galley
Of a vessel from afar,
Sits a pitiful imposter,
Who is called a "Jolly Tar."

In his dress and speech and manner
He betrays a painful lack
Of the stock characteristics
Of the stage and novel "Jack."

For he doesn't speak the jargon
So familiar on the stage,
And forbears to hitch his trowsers,
With a reverence for age.

His jacket isn't tarry,
But of dubious glossy hue,
And his pantaloons are loudish,
Not an unpretending blue.

No poetic, trim tapaulin,
But a cap of greasy prose,
Hides his close-cut locks, and covers
Both his eyes and half his nose.

And when I hail him "Shipmet!"
He does not reply "Belay,"
But he growls a salutation,
In his snarly, salty way.

He spins no naval yarn,
And he sings no naval song,
And his language is sententious,
And sulphurous and strong.

He grumbles at the hardships
Of a life upon the blue;
He reviles the mate and captain
And the boatswain and the crew.

He has curses for the owners
Of his thrice-accursed ships,
With profanest recollections
Of preceding cursed trips.

He blasphemizes about the "lobscouse"
And the "plum duff" and the "prog,"
And he mutters imprecations
On the 'baccy and the grog.

He is low and coarse and dirty,
And is very, very far
From my picturesque ideal
Of the jolly Jack-a-Tar.

And I think of Susan's William,
(But I know they called him "Bill"),
And of Kidd and Vanderdecken,
Who is navigating still.

And I've doubts of solemn Bunsby,
And of Cuttle sagely mild—
And I say "a tar is tarnished"
As a pitcher is defiled."

J. J. ROCHE.

—The great Pedestrian Match between Mr. James Gordon Bennett, of the New York *Herald*, and Mr. Whipple, for \$3,000 a side came off on Tuesday morning, April 5. The distance walked was from 58th street to Jerome Park Gate, nearly ten miles. Mr. Bennett won in 1 hour, 46 minutes and 55 seconds. This was more than average amateur time, considering it was walked on the public highway. Additional credit is given to the pedestrians for quick time over an uneven road, but we regard this as a decided advantage, judging from personal tests of our own. A level track is less desirable by far than an undulating one, as all can learn who wish to try the experiment.

—Captain J. Ross of New York, offers to wager \$500 against \$800 that Wm. Brown, (Mullen's late opponent), can beat the best time on record for walking at any of the following distances: 2, 4, 7, 10, 12, 25, or 50 miles.

—Edward Mullen of Boston, wants to walk Wm. Brown, John Oddy, or any man in the United States, from one to ten miles, for \$500 or \$1,000 a side.

—Cyrille Dion and Maurice Daly are to play a game of French caroms, 600 points up, on May 15, for \$2,000.

Our Okeechobee Expedition.

[FROM OUR OWN COMMISSIONER.]

[The FOREST AND STREAM Expedition, sent out by this office especially to explore Lake Okeechobee, is the only one that succeeded in reaching that body of water the past winter. All letters purporting to come from other sources are written by persons who were permitted by courtesy to accompany our commissioner. The only boat on Lake Okeechobee and the lower Kissimee, was built for our expedition at Beverly, Mass., and taken to Florida by sailing vessel.—Ed. F. & S.]

INDIAN RIVER in April is as beautiful, its skies as serene and its waters as untroubled as in January; but Indian River in April is not the river it was in January, for all that. Its visitors from the north, the Yankees, have departed—and its visitors from the south, the insects, have arrived. The temperature in April does not vary much from that of March; the mornings are deliciously cool, and the afternoons—well, they are warm. Sixty-five in the morning at sunrise; ninety at noon; a breeze from the south all day, and a gale from the west all night.

When I had returned to St. Lucie from Okeechobee my friend at headquarters wanted to leave; and it was only to allow me a flying trip to the Seminole town that he would remain. The reasons he urged for departing were "insects." Fleas and mosquitoes might have their uses, might be a blessing to mankind, but too many fleas and a superabundance of mosquitoes were worse than none at all; and so long as that grind-stone was left out of doors for them to sharpen their bills on, so long was life a burden to him. And so we sailed away from St. Lucie. A few miles from St. Lucie is Indian River Inlet, where the fishing is superb and the mosquitoes abundant. We went over to the inlet one day with my old guide Jim to assist us. The memory of that day's sport will not soon fade away—bass, sheepshead, crevallé—all bit well, and fully sustained the reputation accorded this inlet as the best fishing ground on the coast. Jim had been hunting in the scrub along the sand ridge, and returned to the boat as I hauled in my last fish, bloody and torn. There was blood on his face—blood on his hands, hair and rifle. His shirt and pants were torn and likewise bloody. In reply to my questions he remarked in a careless way that he had run a-foul of a catamount, and that "the beast had showed fight." When I requested him to bring along his catamount, he said it was out there in the sand, and that if I wanted it I might get it. Though I had doubts of the existence of said catamount, I went as directed, and did actually find one, a beautiful creature, about four feet in length, curiously spotted and striped, and with tufted ears. Jim had discovered four of them, had wounded one and then captured him. It was just here that I was camped one night two years ago. Jim was with me and performed a feat that many men would shrink from.

The captain of a little schooner had got his anchor caught beneath a sunken mangrove and was going to cut his cable and leave it when Jim volunteered to dive for and get it up. The water was alive with sharks—this place is noted for them—and the anchor was twenty feet under water, but Jim, after giving me instructions in case he was attacked, dove repeatedly, with the sharks swarming about our little boat, and a rapid current running, till he had accomplished his purpose. Opposite the inlet, two miles, is the residence of Judge Paine, where board and lodging can be obtained, I presume, as the "Judge" has a snug little house with two rooms and beds. He also has a noble pack of hounds, which does duty at the gate. They are very affectionate, these hounds are, and one of them formed an almost inseparable attachment for the calf of my leg one day as I went there for my mail.

The hunting here is not so good as the fishing, though deer may be obtained in the scrub and pine woods, and quail at the old Russell plantation. Fire hunting is the mode usually adopted for shooting deer and other animals. That is, fire hunting *was* the method. The principal charm

of fire hunting lies in the uncertainty attending it, as to what you may kill. I presume the readers of FOREST AND STREAM are familiar with the *modus operandi* of fire hunting. A man goes out, horseback or a-foot, with a pole over his shoulder, lashed to the end of which is an old frying-pan, in which is a fire of light-wood. The blaze throws a lure of light ahead of him, leaving him in darkness. The eye of a deer reflects that light, so that all the bearer of the flying-pan has to do is to "blaze away" at the eye. There is a deal of sport in this style of hunting. I remember a night's experience at South Lake, where I followed my guide about all night looking for eyes. We didn't see any eyes, but we had glorious sport. My part of it was to carry a bag of pine knots, and when my guide lowered the pan to replenish the fire with a knot. 'Twas fine sport, but grew to be a trifle monotonous toward morning. As I said before, in the uncertainty of fire hunting lies its chief attraction. Other eyes than deer's will reflect the light, and the bearer of the pan—the messenger of light we may call him—doesn't know just what particular eye he may "shine" at any particular moment. It may be the eye of an ox, or a bear, or a panther. In case it is the latter, the usual way—if the "shiner" is convinced the *shinee* is a panther—is to deposit the rifle and pan on the ground and climb a tree. Fire hunting, then, has its votaries all along the river. There is one gentleman near Fort Capron always successful. He never goes out without returning with some trophy of his skill. A few nights before I left he bagged a fine mare and colt, and was convinced that if he'd kept on he'd have killed a deer.

The inlet is the place where "B. Hackle" and his friends—thorough sportsmen, all of them—had their finest sport, here and at Jupiter. The Narrows is as good a place for deer as any on the river. As I was sailing through them one moonlight night, I was awakened by my boatman, and looking up, discovered a deer swimming across close to the boat. Revolver, rifle, everything had been packed away, and we lost him. Right here in the narrows one of my acquaintances discovered a bear swimming and undertook his capture. As he had nothing but a hatchet, and a heavy breeze was blowing, he was forced to relinquish the bear after laying its head open, and bruin had nearly upset the boat by getting his paws on the rail.

At Elbow Creek, and across the river on the eastern shore is the finest picturesque portion of the river. The little bay, formed as the creek reaches Indian River, is almost shut in by high coquina rocks. The shores are sandy with high bluffs behind them. The water-worn coquina rock here is the most attractive on the river. It was here that the famous canal, to connect the St. John's with Indian River, was to terminate. It was to be about seven miles in length. A company was formed, a dredge-boat set to work at Lake Washington, lands purchased, a town laid out on paper, and now the machinery of the boat is being transported to Sand Point for use in a saw-mill, and "Eau Gallie" has just as many inhabitants as it had before the bubble was blown. No doubt can exist as to the suitability of the locality for a town, could one be started; for the high pine land slopes gradually to the river, the climate is delightful, and annoying insects comparatively few.

Mr. Houston, the resident at Elbow Creek, is an old Indian fighter, having served through the seven years of the first war. His reminiscences were interesting, especially to me, as he had fought Indians I had met at the Seminole town and while hunting, and fought at localities I had recently visited. A wedge-shaped coquina rock terminates Merritt's Island, two miles east of Elbow Creek. The rocky shores here are worn into innumerable caverns, their roofs supported by water-wrought pillars, and groined arches. The island comes down to this point, ever narrowing, till it terminates a mile north of a palm-crowned point upon the eastern shore. A deep bay is formed, crescent shaped, covered with dainty shells. Bordering this bay is a high shell bluff, covered with wild orange trees. Back of this bluff is an ancient earth mound, from which leads an elevated road-way, sixty feet in width to the sea beach, a mile away.

Now, this place, in my belief, has a share in the tragical history attending the early settlement of Florida by the Spaniards. When Ribaut was wrecked on this coast, and fell into the hands of Menendez in 1565, a part of his force, some 200, escaped down the coast. Soon intelligence came to the Spaniards that the French were fortifying themselves and building a vessel south of Cape Canaveral. A force was despatched, which captured the greater part of the French troops, burned their vessel and destroyed their fort. The Spaniards then built another fort, which they called St. Lucie, and garrisoned it. From many proofs I adduce the opinion that this is the site, this bluff or earth mound, of that Spanish fort. The road, from sea-beach to river, straight and wide, was probably made by the builders of the mound many years before the Spanish conquest, but it doubtless was in condition then to offer many advantages, and not, as now, overgrown with scrub and palmetto. I am not aware that the fact of the existence of this old road has ever been mentioned before—at least in this connection—but, from a careful examination of the ground and a comparison of existing proofs with historical description, I am convinced that I am correct. Mr. Houston found, some years ago, a bolt, evidently a large coupling-bolt, and a piece of iron resembling the trunion of a cannon. I am convinced that a series of excavations would reveal further proofs of my views. Upon the south end of Merritt's Island, west of the shell bluff just mentioned, lives the Crusoe of the river.* He has lived there some three or four years, cultivating the soil and clearing the scant hammock, till he has several acres in a high state of cultivation, with abundant crops of squashes and prickly pear. Within a year or so this Crusoe has purchased several goats, and lives there alone with them and his cat. I went over one day to pay him a visit but he was away. His shanty and goats were still there, though, and I determined to have a picture of them. This shanty was about twenty feet long, five high in the middle, and about six feet wide at the base. It was made by covering a "witch roof" with palmetto leaves, and was open at either end. Two boards formed one side and end of the bed he slept in, and the side of the shanty the other side. There was just room enough to crawl in, so filled up was it with old rope, boards, etc. It looked so snake-suggestive that none of us entered. There was an old broken-legged table, crippled chair, a grind-stone, and a smudge-pot outside. The owner, we afterwards learned, was camping out to get rid of the fleas. There are many inconveniences attending photographing in Florida, and I have had so many amusing and provoking incidents that I shall sometime write a chapter of them. I set my companions to collecting and herding the goats, about fifteen, near the shanty, while I set my camera and pitched my developing tent. When all was ready I looked for my goats and saw them not. They soon appeared, however, in hot pursuit of my boatman Dan, who just escaped old Billy by climbing the fence. We soon got them in position near the shanty, with the aid of my friend and the two boatmen, and retired to my tent to prepare the negative plate. Upon emerging I discovered that the leader of the herd had amused himself chasing my friend about the place, causing him to sit down in a bed of prickly pear, which hurt his feelings very much, and otherwise misbehaving himself. After much trouble we got them in order, and I opened the slide and congratulated myself upon getting a good picture. I hardly counted "two" before a huge old goat, with wide-spread horns, spied my camera and started on a tour of inspection. If he had started leisurely I shouldn't have cared, but he came in a hurry, as though he saw something in my direction he desired, and so I concluded to postpone the taking of that picture, shouldered my camera and traveled among the cacti in a way that brought tears to my eyes and tears to the eyes of my friends on the fence. I never did love goats; and if that goat had seemed at all open to conviction I should have stopped and told him what I thought of goats in general, and him in particular. But I didn't stop, but kept right on, leaped the bank and gained the boat, just as he struck it with his horns. Then he went back and stood peacefully chewing his cud. And I think he is still there, for I didn't go back to alarm him.

As most of Florida visitors are aware, "Sand Point" is the principal place on the river, or lagoon, and about the only point the visitor sees—he is so tired and worn by the ride there that he goes no further. Nearly every writer makes mention of Colonel Titus—"old Titus" he is generally called—and relates the threadbare story of his life as a border ruffian in Kansas. One of his neighbors keeps constantly by him a copy of Richardson's "Beyond the Mississippi," in which is a well-executed engraving, representing the worthy Colonel as praying for his life, kneeling before a band of soldiers. That the Colonel used to "cut up rough" is, beyond a doubt, true, as I have seen persons who had met him in Arizona and Kansas years ago, when he flourished as the green bay tree, and even more so. But why repeat the old story when the Colonel is now settled at the Point, earnestly at work in the good cause—a cause all true southerners are earnest in—of showing the northern how little is here below for his money.

Titusville hotel was closed when I passed it the first week in April, and the throng of health-seekers and sportsmen who had rendezvoused there had departed. It is a strange fact that nearly every visitor to Indian River this winter has had some professional title or other either prefixed or affixed. I believe I have already spoken of the peculiarities of the people of the river in the way of titular distinction. It is a Colonel, Captain or General all along the river banks. But they have succumbed to the overwhelming tide of Drs., Profs. and D. Ds., that has poured in the last winter. Nearly every profession under heaven has been represented, and a great many from other places. As my boatman remarked, you "couldn't do any heavy cussin' for fear your passenger might be a Rev. or Bishop." I got to be so bad that I always fled when I saw a party coming, knowing well that I had no title—professional or otherwise—which might serve to convey that I was versed in some unknown science or posted on military matters. But the "perfessers" and doctors have all gone, leaving Indian Riverites to mourn their loss. I don't know that the people of this section are more avaricious than in any other—indeed, I have always found the residents generous and hospitable—but the temptation to bleed a man with money is irresistible where money is so scarce. Along the St. John's, at the hotels, it is worse than on Indian River. It is just as a Cracker expressed it one day at St. Lucie. He came to my friend, the doctor, with a bottle in his hand containing some unhappy bugs he had captured. Says he:

"Doctor, I reck'n I've gut a curosty fer yer."

"Ah!"

"Yis; when you uns was done gone inter Okeechobee I

cought these yer animils fer yer. Ye see, I was a cuttin' down a cabbage palmeeter and found these yer into the middle on't; and as I never seed any like 'em I jest put em in a bottle, and hev been a feedin' 'em nigh on two weeks. I spose you want 'em, don't yez?"

"Well, yes, I'll take them; how much for them?"

The bugs were worthless, but the doctor always made a point of taking whatever was brought, as sometimes he secured something of value.

"Wall, I don't know; I reck'n about two dollars a piece!"

"Do you think that enough, Mr. T.?"

"Wall, they've been a heap ur trouble to me an' I've neglected my grubbin' to feed them thar critters, an' I rarely suppose they's worth considerable more, but I didn't know how much you Yankees would stand!"

That is the key note rung by the hotel keepers in Florida, "how much you Yankees can stand without collapsing."

At Smyrna I met Dr. Fox, the guide to the Savannah party that sought Lake Okeechobee. As has been stated, they were obliged to return after reaching Lake Kissimmee, owing to the illness of one of their number. They found an abundance of game in the islands of Lakes Kissimmee and Cypress, and the woods bordering the river. From the nature of the country bordering the upper Kissimmee, I knew that there would be an abundance of game, such as quail, turkeys and deer, there being more "hammocks" and less real swamps than upon the lower Kissimmee. In my report I have omitted many things that I will at some future time give to the public.

In speaking of game in my report of March 17, I referred more particularly to deer and turkey. If I include the various birds and animals generally called game by many gunners, then the Kissimmee is well stocked. At the ford were hundreds of white ibis and yellow-legs and curlew, while the settlers vouched for several flocks of turkeys in the "hammocks." Deer were comparatively abundant out on the prairies, wild cats plentiful, while only a few nights before our arrival, a panther had put in an appearance at a settler's cabin, while the man was away, and carried away a hog before the eyes of the settler's wife and children. One of the party had a Remington, No. 12 bore, 30 in., breech-loader along, which made quick work with whatever birds came within range. The execution of this gun is remarkable, and we could shoot with equal ease the smallest warbler or largest heron or hawk. Its simplicity of construction, plainness and cheapness make it just the gun for the collector. This gun with my 9 in. Remington revolver was amply sufficient in the way of fire-arms, though we had encumbered ourselves with several other weapons.

There will, undoubtedly, be many visitors to the Okeechobee and Kissimmee region next winter, and I doubt not that the sporting facilities will be thoroughly tested. The boat in which I made my trip I sold to Judge Parker, a resident on the Kissimmee near Fort Bassenger, and any party desiring to make the trip could not do better than secure control of the staunch "FOREST AND STREAM," as she is a boat well suited to the work.

Before another season comes round I will provide a list of guides and teams available, an accurate description of the routes and all information necessary to guide any one to the shores of the great lake. FRED. BEVERLY.

For Forest and Stream.

THE MAGOG DISTRICT.

THE first breath of spring brings its dreams of past pleasures, and as we inhale the warmer air, there float up before us visions of limpid lakes and beautiful streams, and we seem once more to see the fly falling softly on the water, the gleam of silver flashing up from the crystal depths; to feel the sudden strain of the "strike," and hear the singing of the reel. Once more the battle is fought and won, and the crimson flecked beauty lies before us on the emerald sward. Then we remember that big fellow that caused us such a ducking, and are suddenly fired with a desire to, once more, revel among scenes, the very thought of which is so pleasurable. While the spirit is upon us, rods are examined, landing nets and gaffs are fished out of their hiding places, lines are tested, and flies and casting lines carefully counted over. At last comes the question, Where shall we go?

Now, no doubt many of the readers of FOREST AND STREAM are already forming their plans for the coming season, and perhaps some of them are wondering where to go. From the short glimpse I have had of Hallock's "Fishing Tourist," I should say that it would supply a vast fund of information on this subject, as well as on the best ways of going, and the expense of a trip. The FOREST AND STREAM has indicated many excellent localities for fishing; but there is one of which, so far, it has said nothing, and to it I now intend to allude.

Directly to the north of the States of Vermont and New Hampshire, and west of Somerset county, in Maine, there lies a tract of country which, although the seat of some of the earliest settlements on the continent, is yet comparatively unsubdued. The reason for this is doubtless owing to the extremely broken contour of the country, for we find that where the land is level the country has long been settled. There is no doubt but that the vast water power of this district will some day support a large population, but at present the most of the streams rush unimpeded over their rocky beds and serve as abodes for countless numbers of the finny tribes. The principal rivers are the Yamaska, St. Francis, Nicolet, Becancour and Chaudiere, on the latter of which are the picturesque falls of the same name. The largest lakes are Memphremagog, Massawippi, Aylmer, St. Francis and Megantic; but throughout the region are found numberless smaller lakes, and from the hillsides, countless streams gush down to swell the volume of the larger rivers. The scenery is romantic and beautiful in the extreme, and the mountain air peculiarly bracing.

The region is accessible by way of the Grand Trunk railroad from Portland. Sherbrook being the most convenient point of departure on this line, by way of the Connecticut & Passumpsic River railroad, from Boston, either disembarking at Newport or going on to Waterloo, and by Hudson River & Lake Champlain to St. John's, and thence to Waterloo. Steamer Lady of the Lake conveys the tourist from Newport to Magog, which latter is a good centre of operations. There is a fair hotel at Sherbrooke, the Magog House; rate \$1.50 per day. At Magog there is also a fair hotel whose price is about \$1. per day, and the same is charged at Waterloo for fair accommodation.

Now a word about the fishing. The tourist may do one of three things, he may locate at Waterloo, Magog or Sher-

brooke, and make excursions into the surrounding country: he may take up his quarters at some small village or farm house, near which there is good fishing, or he may camp out, the most enjoyable way of all. In the first case a horse and buggy may be hired for about \$1.50 per day, and there are many good streams within a radius of sixteen miles from Waterloo, though the fish are apt to be small. At Coon's Pond, twelve miles, there is splendid trouting, the fish averaging about half a pound. At Lake Oxford, twelve miles, they are taken weighing over three pounds; at Brome Lake, six miles, there is excellent bass fishing, and some heavy fish are taken, while in the lake at the village you may troll for pike with good success. Mr. E. B. Hodge, or any member of the "Fishing Club," will afford all the information to sportsmen that lies in their power. From Magog, a drive of about four miles takes you to the Lake Oxford above mentioned, and there are several small lakes and streams in the vicinity affording good sport, and you may angle for lake trout, or "lunge" as they are called, in Lake Memphremagog if you have the requisite amount of patience. From Sherbrooke, a drive of about fourteen miles takes you to the Brompton series of lakes where are to be found trout, lake trout and bass, but as boats are difficult to procure on these lakes, the tourist had better make previous arrangements. Ten miles brings you to Lake Massawippi where there are lake trout, and this lake can be reached by a drive of five miles from Magog. There are also small streams within a few miles where good trout fishing may be had, and the proprietors of the hotels here, as elsewhere, will afford all possible information.

In the second place I can only say that there are numerous small villages near which excellent fishing may be had, and though many of them have no hotels, yet the inhabitants are hospitable, and kindly in the extreme and the ambition (?) to become the possessor of the traveler's last cent is, as yet, unknown.

Thirdly, as to camping out, the counties of Wolfe and Megantic are wild and unsettled, as also are parts of the counties of Compton, Richmond and Shefford, and even parts of the town of Sherbrooke, and the tourist would do well to arm himself with a rifle as he may have an opportunity to meet bruin in his native haunts. Of course, only in the wilder parts of the above counties is this possible, but there are numerous smaller animals, and eagles are quite common. The requisite supplies can be procured much more cheaply in Canada than here.

Brompton Lake, and Lake Megantic, Aylmer and others afford splendid sport as well as many tributaries of the Chaudiere. The Waterloo Fishing Club have a shanty on an island in Brompton Lake, and are exceedingly courteous to all sportsmen, and many small lakes near their village would well repay a week spent on their shores.

There are also salmon in Salmon River but they will not take a fly.

The most favorable season for trout fishing is during May and June, and the latter part of September. During the hotter months they are only to be found in the spring-holes and deep shady pools; but there are several lakes in which they can be caught on any cloudy summer day, and during the summer the cool clear air, the fresh invigorating breezes and the numberless fragrant and shady glens offer attractions not to be found in the cooler months.

I hope some of the readers of FOREST AND STREAM may be induced to explore this delightful bit of country, and next season give us more complete information than can at present be given by

TRANSIT.

P. S.—There is a pocket map published, I think, by Smith & Co., St. Johns, P. Q., and Roberts of Montreal, that would be very useful. The price is twenty-five or fifty cents.

For Forest and Stream.

THE FISHING MINISTER.

I HAVE been exceedingly interested in looking over a stray number of your paper which has fallen accidentally into my hands, and it has occurred to me that possibly a bit of fun, or a good anecdote might occasionally be relished by you and your readers. That which I have to relate has the merit of being strictly true, and though told me at first under "the seal of the confessional," the story has got abroad among *confreres*, and the seal is no longer binding.

Let me say then, that we have among our sporting fraternity in Vermont a brother who is a clergyman of the Episcopal Church. For the sake of a name we will call the gentleman Mr. F. and without too minutely particularizing locality we will say that he resides not a thousand miles from the town of Chester. A town that has probably more good trout streams within a radius of twenty miles than any other in the State.

Mr. F. is a gentlemanly, unassuming man, of the most genial spirit, an ardent lover of piscatory exercise, and who can handle a text as well as he can handle a reel, which is saying a good deal.

One day last summer being somewhat wearied by the labors of his study he concluded that he would go out and make a few casts upon a stream a short distance from his window. Arrayed in a pair of high-topped water-proof boots, a well worn but serviceable pair of pants, a short coat with numerous capacious pockets, and broad brimmed Panama hat without a band, he seemed anything but the neatly attired Parson of the Sunday. The stream was much fished, but by the aid of an enticing looking chantry, he succeeded in the course of an hour in killing something like a dozen fine trout, which he stowed away within the well oiled linings of the numberless caverns about him. Having satisfied his ambition he stepped out upon the highway above him, to put up his tackle. Just then a countryman driving along on a spring-board wagon, drew up a moment and looked with sovereign contempt upon the slight rod which the gentleman was unjoining.

"Well," said he, "no luck, eh?"

"Not much," replied Mr. F.

"You fish with too small and limpsy a pole, and too long a line. Jest go down inter the bushes there and cut you a good alder, and tie on a stout string, not too long, and a decent sized hook, and then put on a big hunk of angle, dogs, (worm) and yu'll git some fish, if there's any thar."

"Persons differ somewhat in their mode of fishing," said Mr. F., "some like a long, stout pole with a stout line, as you say; and others prefer a short light pole with a long line—now, I like a light pole with a long line."

"Fudge! why don't you fish with a knittin' needle and a spool o' thread? What sort of a trout would that wipsy pint o' yourn hold—t'would'nt hold a decent sized shiner."

Why, I've got a boy at home only nine years old that would lick that silver thimble thing-umbob of yours all to pieces with a bean-pole."

"Very likely, for I am not much of a fisherman."

"If you want few ketch some fish why don't you go down to the village and git that fishin' minister to go with you, and show you?"

"Fishing minister!" said Mr. F. with a merry twinkle, "who is he?"

"Why, the Piscopal man—I don't remember his name,—the man who's built the new meetin' 'us."

"O yes, I know. Is he a good fisherman?"

"I know nothin' only what folks say. But I've been told there ain't a brook nor a hole within twenty miles that's got a trout in it, but he knows where 'tis; and they say he'll bring home more fish and big uns than any other man."

"What do you think of these fishing ministers?" said Mr. F. quietly putting up his rod.

"O, I've nothin' to say agin it. If they want tew fish let em fish. The 'Postles were fishermen, want they?"

"So I have heard. But, my friend, I have fished with this fishing minister, and I always caught as many troutas he."

"Ha! ha! ha-a! O, sho! I never heard tew fishermen that would agree one could ketch more fish than tother could."

"But what I say is really true."

"Well, well, I know nothin' about it. I've heer'd tell as how he can preach as well as he can fish."

"O yes, he can preach certainly—in a way. But I fear his preaching is as much over estimated as his fishing. I attend his church, and I never hear him but I think I can preach just as well as he can. But perhaps I am no judge; come down some Sunday and hear him for yourself."

"Well, I will," said the man after a pause. "You have a pooty good opinion of yourself I see," he continued, driving along, "but just take my advice, throw that whipstick into the river and cut you a good pole and dig yer handful o' worms and try them."

"Thank you my friend," replied Mr. F. "I will think of it."

A few Sunday's after as Mr. F. entered his church, who should he see but his new acquaintance occupying a conspicuous seat in front of him. The man looked at him very attentively for a few minutes, twisted about somewhat uneasily in his pew, and finally settled down into close attention. After the service was over, Mr. F. put off his robes and hastening down the aisle intercepted the countryman just as he was leaving the church.

"Well, my friend," said he, holding out his hand, "don't you think I can fish and preach as well as the 'fishing minister'?"

"O Lod!" said the man starting back, "I thought so. I don't know nothin' about yer fishing, but I must say you preached an uncommonly good sarmon fur one that come from a goose quill."

SENEX.

For Forest and Stream.

"TWIN LAKES TROUT FARM."

THE Twin Lakes are fast growing into favor as a camping and picnic resort, and as there is but little of "civilization," so called, on their borders they may be considered sufficiently wild for either purpose. On the mountain tops near at hand are lakes as really wild and much less frequented than the Adirondacks or Maine lakes, and abundantly stocked with fish and game. It costs \$2 80 to get to Twin Lakes station, via Harlem and Connecticut Western railroads, through ticket, and it will "pay" to come in the right season. Try it!

To a few enthusiastic artists—as George Broughton, Homer Martin, Gay, etc., and more enterprising anglers as H. K. Brown and others, they have long been known for their picturesque and piscatorial beauties, and of late even an occasional letter writer has been tempted to explore the length, breadth, height, and depth of one of the curious caves lately discovered on the lake shore in amaze of not quite pleasurable experience. I refer to Professor Richards' "Six Hours Lost in a Cave," published in a late number of *Appleton's Journal*.

The "Twins"—"Waushinec" and "Waushining"—are located on the line of the Connecticut Western Railroad, some twelve miles east of Millerton, on the Harlem, and fifty-seven miles west from Hartford. They are on high ground, some 500 feet above tide water, and held in place by a range of hills that barely keep them from sloping over into the valleys below when the wind blows very fresh. From the highest of these hilltops one may overlook a great extent of scenery both up and down the Housatonic Valley, with the grand dome of the Toghkanie range, some 2,000 feet higher on the west, while a spur of the Green Mountains that trends, exceptionally, east and west, shuts in the view by means of the hills of Canaan and Norfolk. The Twins are "siamesed" together by a narrow, crooked strait, that is barely boatable in low water, which cuts through the natural causeway that long served as a highway, and now affords just additional room for the railroad and the "Twin Lakes station."

The Twins are about as unlike as two peas (marrowfat and sweet peas, for instance), Waushining being clear, cold, deep and nearly symmetrical, with an island of some thirty acres in its northwestern portion; while Waushinec is shallow, long, and in shape not unlike a crook-neck squash, with its outlet at the stem end, that winds down through the mill and furnace wheels of Chapinville, the forges and scythe works at Hammerton, and finally, after taking in several trout streams, finds its way into the Housatonic at Sheffield, some ten miles further north. Both lakes are well stocked with the fish usually found in this region, and vast quantities of pickerel and perch are taken from the smaller lake during the winter, and many find their way to your city markets through pot hunters, who are not quite unknown even here. The large lake—some six miles in circuit—has long been famous for its fine pike (pickerel they are called hereabouts), and fish of five to seven pounds weight being not unusual in the bygone days; but since the stocking of the waters with black bass, some years since, the pike are not so plenty nor so large. The abundant supply of bass, however, more than makes up for it, and during the summer afford rare sport to those experts who know the when and the how to take them. The angler who trusts to a light fly rod and fine tackle, with grasshoppers and minnows for bait, may land from five to ten two pound fish in the course of a morning, and not find it boy's play either; and when he gets a brace of them into hot water (never fry a large fish) an hour after, and done *a la salmon* and served hot, with his eyes shut, his palate will hardly know that it is not really off the *salmo genus* he is feasting. Thus far the bass do not rise to the fly, but it is hoped that they may be educated up to that pitch of excellence. Very large perch are often taken in the deep

lake, and a portrait of a sixteen inch specimen hangs in the studio where I write, together with the picture of a white fish twelve inches long, which was picked up on the beach a year ago, and is the only specimen I have seen from these lakes, though I am told they have sometimes been caught when fishing for carp, which they somewhat resemble to the unpracticed eye. How they came here is a mystery, but it is said that some fishers from Albany threw away a lot of bait they had brought from the Erie Canal, and that that's the way of it. Efforts are now being made to stock the lake with salmon trout, for which its deep, cold water and rocky bottom is admirably adapted. Close around this lake region are numerous trout streams, that tumble down the sides of Toghkanie, or bubble up in copious cold springs along its base, which afford the angler fine sport: notably More brook and Bracie's brook, in Salisbury, and Bartholomew, Spurr, and Lee brooks, in Sheffield, not to forget the Sages' Ravine brook, that divides the two States, and can show the finest waterfalls, next after Bash Bish, in western Massachusetts. These streams are hardly large enough for the fly fisher's best efforts, though the writer has taken well fed trout of two pounds weight from the Lee brook, and very good creels full in Sages' Ravine and the More brook.

Of game common hereabouts there is a sufficient variety—grouse, woodcock, quail, squirrels, and rabbits, not to mention mink and otter, fox, wild cat, and woodchucks. While I write, my window looks out upon numerous flocks of ducks on the just open lake, such as broad bill, shell drake, whistler, bufflehead, brant, black duck, and in short nearly every kind found on any fresh water, and in great abundance; and the air and our feelings are daily harrowed by flocks of wild geese, that go "honk," "honking" over our heads, or splash into the lake, always, of course, just out of gunshot range.

To-day, March 25th, a woodcock has put in a first appearance beside the little brook that sings past the house, and there is a good promise for quail, as numerous bevvies were seen during the fall, and the winter has been quite favorable.

Of pigeons we have had our full share, but as they are strictly birds of passage they must be taken flying. Since the advent of the Connecticut Western Railroad, numerous parties of campers out visit the lakes from Hartford, Pittsfield, and other near towns, and picnic parties are even more numerous, as many as five or six car loads of juvenile health seekers being left some days at the grove near the station, which affords ample shade, and, under the care of Herr Odenbright, adequate accommodation. The cave is always a place of great resort during the dry season, and to those curious in stalactite and stalagmite lore its many "marble halls" (limestone, by the way) seem to afford amusement as endless as are its but partially explored depths. Boats may be had for the asking (price fifty cents per day) of Mr. Odenbright, near the Twin Lakes station, and on the large lake of E. Sherman Pease, the artist, angler, hunter, and trapper, whose painting of pike and rabbit you so kindly noticed in a late number of the *FOREST AND STREAM*.

Canaan, Connecticut, March 25, 1874.

For Forest and Stream.

TRESPASS AND GAME LAWS.

I AM glad to see that you are agitating the absolute necessity of more harmony in the game laws of the various States, and doing away with the so many incongruities in them. And when you suggest a national association as the remedy, you hit the nail squarely on the head. For a long time it has been a favorite idea of mine. In my humble opinion, our entire system for the protection of game should be revised. I would suggest:—

1st. That each State should have an association composed of delegates of the various clubs, chartered by its legislature and endowed with corporate powers, and to it should be delegated all matters pertaining to the enforcement of the game laws in the same manner as is given to the "Society for the Prevention of Cruelty to Animals" for the enforcement of its laws.

2d. Do away with those useless things—game constables—and let the State association appoint its agents in every district; his pay to be so much out of the fines as the association may determine on; all suits he may bring to be in the name of the association.

3d. Increase the penalties for violating the laws so much as to deter those disposed to, from violating them; and in every instance where the offender has not property to satisfy the judgment, and will not pay the fine, let the body be attached.

4th. Let two-thirds of the fine go to the State association, or to whoever may bring the suit, the remaining third to go to either the school or poor fund of the county.

5th. Prevent railroad and express companies from transporting game from one State to another during the close season under a heavy penalty.

6th. Let a national association be formed, to consist of delegates from the various State associations, and to meet annually, whose duty it shall be to harmonize the present conflicting provisions in the laws of the various States, which now enable their being evaded so easily, and to correct whatever may from time to time need it.

7th. Pass a good trespass law, protecting the owner of the land from lawless and reckless injury to his property.

That something must be done, and that at once, for the preservation of game, is apparent to every sportsman, as it is but too evident how rapidly our game is diminishing. Our present condition is one of chaos. A glance at your table of close seasons—in No. 8 of this volume—will show how conflicting are the laws of States in contiguity to each other, and consequently how much more of harm than of good they must be productive.

Unfortunately, the majority of sportsmen are too apathetic on this question, caring merely for the gratification of the present, and regardless of the future. There are those who realize the condition of things, and admit that something must be done, but are not willing to do anything themselves, depending on others doing it, though expecting to profit by it themselves.

What we want is unity in purpose and action, and last, though not least, a little less selfishness. Every sportsman should remember that he is one of a community, and be ready at all times to contribute his quota to the benefit of the fraternity at large, and by so doing he would be contributing to his own good, as what benefits the body at large benefits him.

This selfishness has had more to do with this very incongruity among the laws of States in contiguity to each other than may be imagined. Happily, it is getting less, the evil

working its own remedy, and it is to be hoped will in time be entirely eradicated.

By a closer union we could influence legislation of a proper and advantageous character. As we are now, it is often left to those who, knowing nothing of what they are legislating about, make a bungling job of it, generally doing more harm than good.

The abolition of the office of game constable, and in its stead the State association appointing its own agents, would be productive of much good. In most instances they are entirely indifferent to the violation of the law, and are themselves often either parties to or actual violators. I know of instances of such being the case.

As local clubs cannot be depended on for enforcing the laws, as there are often too many personal interests intervening, the only thing is to leave it to the State associations. By doing so, and increasing the penalty and the emolument to the informer, so as to make it worth the trouble, a more rigid enforcement would be instituted. The penalty, being heavy, would of itself deter many. That the body should be attached, and the culprit imprisoned, when there is no property to satisfy the judgment, would be just, as the majority of those who pot hunt are irresponsible.

It is imperative that we place some restrictions on the railroad and express companies as forwarders, for they are the most able auxiliary the pot hunters have, as by carrying the illicit game they enable them to violate the law.

One provision I forgot, but which is important, and that is the abolition of sectional legislation. The law should cover every part of a State, and not exempt portions of it, as it does now.

A good trespass law I am in favor of, the owner of the land, I think, being entitled to the same protection of his property as any other person. But of this, with your permission, I will speak more fully in my next.

Your plan for field trials, to be held by each State, and by the national association, I like, and if carried out would be productive of much good to both the sportsman and the dog. One good effect it would have would be to eradicate the miserable mongrels, which it is so common to see those claiming to be sportsmen exhibiting dogs that "can't be beat."

MOHAWK.

New York, May 4, 1874.

For Forest and Stream.

HOW TO SHOOT AT LONG RANGE.

NUMBER SIX.

I RECEIVED a letter the other day from a Canadian friend, who is a capital rifle shot at all ranges. He said that in reading my letters he observed that I seemed to stand in wholesome awe of the Irish team, and would like to know what their practice had been. Thinking that the information might interest others as well, I have copied from the last report of the National Rifle Association of Great Britain the scores of the winning eight men in shooting for the Elcho shield for the last twelve years as follows:

They always shoot fifteen shots at 800, 900, 1,000 yards each, making 360 shots in all. If all of them had been bulls eyes, highest number of marks 1,440, average 4; centres, highest number of marks 1,080, average 3; outers, highest number of marks 720, average 2. The winning team actually did make as follows:

Year.	Won by.	Points made.	Average
1862.....	England.....	890	2.48
1863.....	England.....	1082	3.00
1864.....	Scotland.....	967	2.68
1865.....	England.....	1053	2.92
1866.....	England.....	1170	3.25
1867.....	England.....	1097	3.04
1868.....	England.....	1166	3.24
1869.....	Scotland.....	1149	3.19
1870.....	England.....	1166	3.24
1871.....	England.....	1204	3.34
1872.....	England.....	1183	3.31
1873.....	Ireland.....	1195	3.32

The actual score in detail, as made by the Irish team last year was as follows:

THE ELCHO SHIELD.

(1862.)

COMPETED FOR BY ENGLAND, SCOTLAND AND IRELAND.

Eight competitors on each side.

Distances, 800, 900 and 1,000 yards; No. shots 15 at each distance; Rifle, any; m. w. 10 lbs.; m. p. t. 3 lbs.; H. p. a. s. 1,440 marks.

Won by Ireland with 1,195 marks.

Score made by England, 1,175 marks; by Scotland, 1,128 marks.

	800 Yards.	900 Yards.	1,000 Yards.	Total
Ireland.	Yards.	Yards.	Yards.	T/L

*Worcester. †Irish R. Association. ‡Irish R. A. §Irish R. A. ¶Ulster R. A. **Irish Rifle Association.

It will be admitted that this is good shooting and hard to beat. The men who can beat it can only be found by constant practice at the required ranges. But Creedmoor is the only place in this country where any number of persons can find such ranges, targets, and systems of marking easily accessible. It takes considerable time and money to establish such ranges, and it is not probable they will be established elsewhere in time for this challenge match. Therefore, it appears clear that although the Irish challenge is nominally given to the whole United States the conditions of the case limit it in reality to those persons to whom Creedmoor range is accessible.

What we believe is necessary, therefore, is to induce as large a number of persons as possible to practice regularly at Creedmoor at the match ranges, and to induce them to do so we would suggest the propriety of asking for subscriptions to raise a pool by which small prizes may be distributed every week, not to one or two only, but to all who can make over certain averages, say above 25.

T. C. C.

—The Nassau Boat Club have been practicing in their new English-built, four-oared shell, and are satisfied with the purchase. This club will row a match in six-oared barges with the Harlem Rowing Club on Monday, May 11.

For Forest and Stream.
A BIRD'S SONG.

ONE day a bird whom God had taught
The wondrous art of song,
Repented of a song he sang
Among the singing throng.

"Among so many warbling throats,
What need of my poor strain?
Would I had never sung that song—
Could call it back again."

He never knew the listening wind
Had borne his song away,
And left it with a breaking heart,
And made it whole that day.

Boston, Mass.

ELLEN M. WOODS.

Woodland, Lawn and Garden.

SPECIAL DIRECTIONS TO OUR LADY CULTURISTS AND OUR AMATEUR FRIENDS.

WE have in the foregoing papers taken up the whole subject of flower bed planting, and the necessary requisites for making a good garden. We have given a plain and concise statement of the manner of laying out the forcing or hot bed, of making small city gardens, of the kinds of flower seeds to plant, and the best arrangement of bulbs and showy plants, according to our own experiments and close observation. We have, lastly, spoken of cold frame and the florist's garden, or the reserve bed, for we suppose by this time—if they have carefully followed our directions—that many of our lady friends are prepared to accomplish all we have stated with good results.

Some persons will doubtless think that the effort to grow nice fair flowers within the circumscribed limits of a city yard is an impossibility. Some will say, "It cannot be done; I have tried it and failed." Well, we grant that you have tried, and we believe you when you say you have failed. We believe you have failed not from necessity, but from the omission of some important item of the formula as laid down by us. You will know that many beautiful plants grow in the midst of a very dense London fog. Yet even here many plants will not grow, and they are never planted. Just such laws govern all kinds of plants. If one were to make the attempt to grow the delicate white china rose amid the sooty damp atmosphere of the back enclosures of London he would assuredly fail; his labor would be in vain. Therefore, he acts as directed by knowledge, and plants in its stead something that will grow—a fine hardy grower termed the cabbage rose. This rose, or the maiden's blush, will make fine large bushes even under the most adverse circumstances. Our London florist sends over to America, a more genial elime, his nice tender china roses, and they live and bloom for years.

Among the plants very suitable for our small city gardens we would name, as quite likely to give our lady friends good satisfaction, the following, all of which we have tried, and can recommend as generally doing well with ordinary care. We give the names of the trees and shrubs and plants, leaving the choice of the same to the good taste of our readers, assuring them that with care they will pay: *Aucuba japonica*, *ageratum*, *Abronia umbellata*, *Aesculus hippocastanum*, astors, in variety mixed; *Amaranthus salicifolius*, *antirrhinum*, *Betula alba*, *Bignonia radicans*, balsams, in varieties; *Bartonia aurea*, *Braelycome iberidifolia*, mixed varieties; *browallia*, varieties; *Calandrinia calliopis*, *Rocket candidum*, sweet scented candidum, *canna*, *calladium*, *coxcomb*, *new Japan*; *celosia*, *Centaurea drummondii*, *convolvus*, *crepis*, *dahlias*, varieties in their season; *Daphne mezereum*, *draccephalum*, *Dianthus hedderiggii*, *Dianthus ladiuriatus*, *Floro pleno* and varieties, double daisy, *cuteoa erysimum*, *epilobum*, *escholtzia*, *Fagus sylvatica*, *fraxinus*, *gillardia*, *gilla*, *gladiolus*, *German stocks*, (ten week stocks). We have carried our list alphabetically to the letter H, which will give our readers ample time to procure the above seeds from any reliable nurseryman, and they can then plant the same, and in our paper next succeeding this we will give a further list of the plants and seeds most desirable to procure to give them a most beautiful garden in front, court or rear of their houses.

As these papers are quite practical in their character, and the seeds recommended having all been grown by ourselves, and the peculiarities of such given as required it, we feel assured our lady friends and amateurs need not fail in having a very nice assortment of annuals, or shrubs of plants and roses.

In due time and place we shall inform Isabella F. of the best kind of roses to plant in her garden.

OLLIPOD QUILL.

GRASSING A SLOPE.—A steep slope may be grassed over without sodding by first smoothing the surface and then mixing a tough paste or mortar of clay, loam, and horse manure, with sufficient water. The grass seed, which should be a mixture of Kentucky blue grass and white clover, should be thickly but evenly scattered upon the moist surface of this plaster, as it is spread upon the bank. The plaster should be at least one or two inches thick, and a thin layer should be laid over the seed. The surface should be kept moist, and a light dressing of some active fertilizer would help the growth. In a few weeks the growing grass should be cut and should be kept short at all times until a thick sod is formed.—*Keystone, in the New York Tribune.*

THE CULTIVATION OF THE CURRANT.

NOTWITHSTANDING the universality of the currant, it being found in some form in almost every garden, yet there is a wide difference in the quality of the fruit found. Good currants are a luxury, and can be well and profitably grown, as many cultivators of this fine fruit can attest. The currant is well adapted for growth in all our northern climates, while as yet no fruit has been found better adapted to the wants of the south than well cultivated, finely grown, large cherry currants. Much more is thought of the claims of the currant to-day than was bestowed upon it ten years ago. Much more care is readily given to its cultivation. Said a neighbor of mine one day ten years ago, "What are you planting out there?" "Currant slips," was the answer. "Do you ever expect to gather any fruit from your labors?" "Certainly, or we should not labor." "I would not give you a peck for all you ever raise; good morning, neighbor." My friend passed to his business, and I continued planting out my currant slips. I cultivated those slips in the best manner known to me. When you take into consideration that it costs no more to cultivate a fine, nice, large variety of currants than it does a bush of poor shrivelled up starvelings, you will be quite sure not to neglect your currants. It is for the interest of the cultivator, therefore, to grow only the very best of fruit, and give it the best of attention. The finer the crop the greater the remuneration. The best soil for the currant will be found to be a rich loam, rather heavy than light. This soil, deepened with a plough, say to one and a half feet, and well manured with any good manure, will make your ground what it should be for currants. If you purchase your currants from the nurseryman, you will place them in a row four feet apart each way, and this is perhaps the best arrangement you can have, as it gives you ample room to work between the rows. The plants we are now speaking of may be set in autumn or in spring. I prefer the spring. At any season, prepare to mulch the ground about them very well. The natural habit of the currant being to form a bush, by sending up quite a number of shoots from the roots or collar, raises the question of "Shall I have a bush, or shall I have the tree form?" Here the whole subject of after training comes up for your consideration. There are good reasons to be found for both these modes of cultivation. If you decide to raise from a single stem, or tree form, you have your cutting to strike from. Those grown with the clean stem are fine looking plants, and are much more easily formed and cultivated than are the bush culture. These should always have a place in small gardens, where a nice, trim, and pretty appearance is desirable. The currant cultivated from the single stem grows large clusters of the most delicious fruit of a cherry or amber color, and are a charming addition to any garden. I have seen two quarts gathered from one small bush of the tree form. In small gardens I would recommend the tree form. In large gardens, where the fruit is grown for market, I recommend the bush form of cultivation. These bushes will live a long time, and produce large quantities of fruit of the finest quality if properly started, well manured, and thoroughly cared for. The proper pruning of the bushes requires all the art of the cultivator, and here comes in a pause. If you are not quite willing to do your duty to your currant bushes in the hereafter do not plant out a single bush. If you are prepared to take your knife in hand and manfully execute your skill and do your duty to your currant bushes, they will discount liberally. But the proper pruning and neat cultivation required is very difficult, and also very necessary, as you will hereafter see. Listen to our suggestions, and then plant or refrain from planting.

The natural habit of the currant, as before observed, being to send up many straight shoots, they become too numerous if left to themselves, and therefore a part must be removed with the knife. Some of these shoots start below the ground, and if you do not make a clean cut here the next year, instead of having one shoot to cut, you will have two, and so on. Unattended to, in three years you will have an unwieldy bush, but if a fruit bearer, a miserable apology and a cumberer of the ground. A modification of this I have found easily practised, and quite productive of good results. To do this effectually you will save six of the stoutest and best shoots, cutting away all the others as clean as possible. These will develop into a bearing bush. Now keep the top properly thinned, and whenever one shoot fails train up another, of which you always have enough to take its place. This cutting out and replacing each year will give you what you desire—rich, juicy, melting fruit, and you can have it in no other manner.

OLLIPOD QUILL.

DESTRUCTION OF THE ADIRONDACK REGION.

NEW YORK, April 18, 1874.

EDITOR FOREST AND STREAM:—

I read with much pleasure the articles that appear in your very enjoyable paper in regard to the Adirondack woods, and to the pleasures therein contained. As I have for many years been a frequenter of these woods, and spend a part of each summer there, I feel greatly interested in everything pertaining to their welfare. And I have for some time intended to drop you a line in regard to one thing of great interest to every lover of this wilderness. I allude to the necessity of some immediate action that will end in removing the dam on the Racquette River near Setting Pole Rapids. The set back from this dam floods each side of the river for a distance of more than twenty miles, in fact to the falls at Mother Johnson's; and the banks of this once beautiful stream are fast becoming a dismal swamp. The maples that line its banks are already dead or dying and beginning to fall across the stream, rendering boating difficult and dangerous. In two years' time the beauty of the stream will be ruined beyond hope of repair. Have you ever been on the

Saranac River where it has been overflowed by the dam at Blood's Hotel? If so you will then see the desolation that has been made by backwater. If I were to illustrate some scenes for Dante's "Inferno" I would seek there for inspiration to do them justice. It will take but a very short time for the Racquette to present the same dismal appearance. A few lumber speculators, for their own profit, have caused this dam to be built to the detriment of every dweller on the banks, who must sit helpless and see their farms overflowed and their homes rendered uninhabitable, as they will be from the sickness necessarily attending the drawing off of the water during the summer. They have not the means to fight the wealth that will be opposed to them, and their only hope is that the State will interfere and do away with this dam. Last summer, in going to Tupper's Lake from Sweeney Carry I do not think I was in woods. The air was perfectly impregnated with foul odors from decaying vegetation, and later in the season the fish, dead and dying, could be counted by hundreds floating on the water. The fishing for trout in this stream is ruined for all time, as the pickerel have driven them out of all the waters below the falls, except the small streams, but the beauty of the river itself can be saved, if something can soon be done to prevent the annual overflow. And I know of no more feasible way than to let the people know through your columns how great an injury is being done to the most desirable part of what is being proposed as a public pleasure ground for us and our children forever. I remain, yours truly, J. H. McC.

The Kennel.

THE BRITISH CANINE WORLD.

BY FRANK C. PEARCE, EDITOR OF THE KENNEL STUD BOOK OF ENGLAND.

IT is more than fourteen years ago that Mr. Brailsford organized the first show of dogs ever held in England, or, I believe, anywhere else. It was confined to sporting dogs only, Mr. Josh Jobling's "Dandy," a black and tan setter of exquisite form, who was designed to be the father of innumerable cracks, was the prize-taker. Mr. Walsh, the editor of the *Field*, was one of the judges, and as the number of the entries was very small indeed, scarcely exceeding a baker's dozen, its promoters could scarcely have anticipated that in 1863, only four years afterwards, no less than sixteen hundred dogs would compete for canine honors in the Agricultural Hall at Islington. This was long before the days of the Manchester gentleman's setter, or "Laveracks," as the now celebrated breed is called. In such times as those the rich black and tan Gordon's were every where triumphant. The Rev. Thomas Pearce, of Morden, came to the fore with a wonderful bitch called "Regent," and she and his matchless "Ruby" carried everything before them. Then he bought out of a large class with surprising judgment a dog called "Kent," from a Kentish Baronet, and prizes and medals fell thick upon him. Nothing living could touch the old black and tan, whose grand imposing stature, charming contour, and bloodlike symmetry, were unequalled by hundreds of his rivals that thronged the show benches at Paris, Islington and Birmingham. He won wherever he appeared, and his owner not only repeatedly refused a king's ransom for him, but made a large income out of his earnings at the stud. But what, you will say, was his pedigree? Ah, there's the rub! No one ever knew, and it was not until the mischief was done that the pureness of his origin was questioned. His looks had placed him like Caesar's wife, above suspicion, but when it was found no lineal ancestors owned him as their descendant, and that the stock he got were gun shy, nervous and weedy, trembling at the gun and crouching with terror at its report, breeders saw that they had too hastily preferred "form" to blood, and neglected the maxim "that blood will tell." A brilliant imposter no doubt he was, and far and wide he spread the evil effects of his mongrelism. There is not at this present one kennel in England which has entirely got rid of the poison he disseminated, though it must be owned that amongst his progeny there were a few striking exceptions to the sad rule. "Young Kent," the Marquis of Huntley's celebrated field trial dog, was one. This setter hunted by "Idstone," who broke him and sold him to the Marquis, beating all the best dogs of the day on Mr. Price's moor at Bala in the £25 sweepstakes, though by a mistake of the judge's afterwards pointed out in the *Field* and noticed by the editor in his leading article, he was merely accredited with a division of the second prize. There also was a lovely bitch called "Moll," who called him sire, and another, a crack of Mr. Walsh's "Rex." In every litter "Kent" got there was one or more red puppies, probably showing Irish blood somewhere. Mr. Pearce's "Bran" was of this color, a winner at one of the great shows, and sold late in her life as a model setter to Mr. Frederick Taylor, the first animal painter in water colors of the day. But black and tans fell into evil repute, and Mr. Laverack's Belton greys soon became fashionable, and are now perhaps more in number than any other breed. They are mostly mottled in color like black wafers on a white ground, rather small in size, and though as a rule too broad-chested to gallop like the Gordon's, yet possessing an even, pleasant method of going.

At the late Rhiwlas trials Mr. Purcell Llewellyn's "Countess," perhaps the most celebrated of her strain, competed with a great reputation to support her, (no small advantage in man or dog.) Her speed and style were undoubtedly good, though inferior to that of the famous "Belle," now no doubt familiar to the readers of *FOREST AND STREAM*, but she was so resolute that when worked to the braces she made points 200 yards away from the gentleman who worked her and became stiff and tired on the day of the stakes, and so lost very easily, though her disappointed owner took it amiss and "went for" the judges and the unfortunately "frank" reporter in the columns of the *Field*. Mr. Garth, Q. C., had another Laverack called "Daisy," a decided creeper, but of much merit, and his kennels at

FIELD TRIALS.

WE have invariably stated in our correspondence with influential English sportsmen, that the great drawback to the present method of field trials is the system of "drawing" the entries, and moreover, the evident all-powerful licence given to the judges which militates considerably against the satisfactory success of these tests of pointers and setters.

In our issue of April 9th we gave a plan for field trials which we think, if carried out with one or two alterations, would satisfy all the requirements of owners of dogs on trial, and avoid all disputes and wrangles which seem to be inevitable under the present arrangement. In order to give the opinions of all classes of breeders of dogs on this interesting subject, and as there is no doubt that field trials will eventually become as popular in this country as they are to-day abroad, we therefore publish a letter from a correspondent in *Bell's Life*, in which it will be noticed that he sanctions the plan of field trials published by us two weeks ago.—

Sir:—Field trials will never become popular among the sporting public until considerable modification in the system of judging is brought about. There is a very general feeling that too much bias exists in the minds of judges as to the previous performances of the animals, which acts detrimentally against an unknown competitor, and too beneficially in favor of one with better-known credentials. After the Ipswich trials of last year I ventured to express my opinions on this head in your journal of Oct. 4, 1873; and from the hearty response with which those opinions were received I have reason to believe that in reiterating them now, at the commencement of another season, I shall do so with the acquiescence of many who, like myself, would freely participate in field trials if they could do so without the incubus which is attached to canine obscurity. In my humble judgment, field trials should, like coursing trials, *decide themselves* by a series of easily-reckoned points, which can pass through the calculations of the judges in a *give-and-take manner during the trial*, and leave one of the competitors with a surplus at the end, and, therefore, "master of the situation." Then, it cannot be right to go through the formality of a public "drawing" to determine, by lot, the order of competition, and to overturn this order by placing beaten dogs against unbeaten ones in any part of the stake, and to allow a dog that has suffered individual defeat to take a second or third prize away from animals that have gone through their trials unconquered! As a dog is drawn, in that order he should run through the stake—a winner displacing a loser in every trial, and a winner, inferior to himself in every round, and so on until the final course decides the fate of the last two left in. Here the element of chance which accompanies "the draw" adds to the excitement of the competition and equalises the prospects of many of the antagonists. Furthermore, judges should not shoot, for the very palpable reason that two things can rarely be done well at the same time by the same person. What objection, may I ask, can there be to the owners or keepers of the animals competing taking their guns in hand during their trials. Surely this is the most natural condition for the dogs to show themselves to advantage; and by this means another drawback I have noticed would be obviated, of too much crowding in the van by the judges or the spectators, which tends frequently to shut out the view of the dog from his master at a critical moment. Next, the time specified for the trials should be carefully apportioned, and as strictly kept; well-known dogs, if "out of form," should not have the chance of remedying faults made to-day by an extra period of grace given them, because the judges have seen them win a field trial yesterday. As a dog behaves on the day of competition, on this let his chance for the stake depend. No argument can convince me that one dog should have twenty minutes and another be down two hours. A timekeeper should be appointed—allowance made by him for change of ground and getting over fences—and at his dictum the trial should terminate, all sharing equally. An undecided may result; then, as in greyhound trials, after two courses, it can be run off, unless the owners have, in the meantime, entered into an arrangement to draw one in favor of the other. I believe an easy modification of the present "code of points" would render the whole thing simple enough, and, concluding that sufficient care has been given in the relative apportionment of these points to constitute a perfect animal, by cutting out the ciphers of the present code, by taking the guns out of the judges' hands, and, above all, by deciding a trial, *then and there*, as points have been won and lost throughout its length (not summing up at the end of the day, and having dogs put down again matched capriciously by the judges,) a very great step in the right direction would be taken, which would render trials of this kind more popular among our pointer and setter breeders.

OLD CODE OF POINTS.

30	20	20	15	10	5	100
Nose.	Pace and style of hunting.	Breaking, as shown by working to hand, dropping to wing, fur shot, &c.	Pointing to style and steadiness.	Backing.	Drawing in game or road-jing.	Total.

SETTER PUP "FLASH."—Our Baltimore correspondent "Nimrod," asks us the following questions about the Pedigree and breed of his setter "Flash:" "Will you oblige me very much by telling me if you know anything about the dog I am about to describe and now own? He came to me with the following pedigree: black and white setter puppy Flash, from the kennels of Mr. Gubner, Long Island, out of his famous bitch Lisca, by his dog Jack; Lisca is out of Wm. Nash's bitch Fan, the dam of H. Russell's famous Snowball and John Conley's Rover, she by Paul Mead's old Dash, he by L. Swarty's Glen out of Maggie, a white bitch of great fame. Jack is out of a white and black bitch imported by Mr. Palmer, of New York, and is one of the finest setters on this continent. Flash is now about fifteen months old, is a dog of great promise, but was never handled until this

spring on snipe and is anything but a handsome dog." Answer.—The dog Flash, if he is out of Lisca, was sired by Hugh McLaughlin's Dan, this being the only time she ever had a black and white pup. Lisca's pedigree, as stated by "Nimrod," is correct, but the dam of Dash, Maggie was red not, *white* and *black*. There is also a mistake in the pedigree of Jack; he is out of Belle, a red Irish bitch imported by Mr. Palmer, of New York, the dam of Rodman's Dash by Stephen Putnam's Dan. We are indebted to A. Gubner, of New Utrecht, Long Island, for the courteous explanation.

—Mr. R. Schuyler, son of the prior of the firm of Messrs. Schuyler, Hartley & Graham, of Maiden Lane, has just received a magnificent specimen of a Gordon setter bitch, who was a winner in the puppy stakes at field trials held at Shrewsbury in 1872. This dog was presented by Mr. Tom Webley of the firm of Messrs. Webley & Son, the eminent breech-loading gun manufacturers of Birmingham, England.

The Horse and the Course.

—The Fleetwood Park Trotting Association inaugurated the trotting season on Saturday May 2d. There were two events set down. The first was a match of \$400 against time three miles in twelve minutes. The bay gelding Whitefoot trotted the first mile in 3:44; second mile 3:51; third mile 3:42—Total 11:17.

The next race was a sweepstake of \$200, mile heats, best three in five, amateur drivers. Ben. Wilson's Patsey Bolivar won in three straight heats 3:00; 3:01; 3:01

—The May trotting meetings at Beacon and Mystic parks closed their entries last week. The several purses filled remarkable well, there being in all fifty-two entries for each meeting. The Mystic Park meeting commences May 12th, and the Beacon Park May 19th.

—An excellent painting of Sensation, the winner of the \$20,000 purse at Buffalo, last year, is on exhibition in the window of Hanlan & Co., on Tremont street, near West. The painting is by G. H. Bailey of this city.

—To-morrow there will be a race at Mystic Park. The entries are Modoc Chief, Meddlesome, Lady Mac and Grace.

—Mr. H. N. Smith, the owner of Jay Gould, has accepted the challenge of Mr. A. F. Fawcett, the owner of Bashaw, Jr., and will trot his fast young stallion against the latter horse, for \$5,000 a side play or pay, as proposed; the race to be mile heats, best three in five in harness, on Bishop's course, October 15th.

—L. Dorsey of Eden Stock Farm, near Louisville, Ky., has accepted the challenge of Mr. Jas. Willson of Indiana, the breeder of the Blue Bull stock, to trot four or five races—two colts, the get of the rival stallions Goldust and Blue Bull, to be entered every race, for \$1,000 each race.

—Mr. Charles S. Green of Babylon, L. I., offers to trot his horse Wallace in a race of twenty miles against any horse in America, for \$500 or \$1,000.

—The proprietors of the Prospect Park Course have given a purse of \$2,000 in a race of nine heats, best three in five, to be trotted between the 15th and 16th inst. Eph Simmons has entered the roan gelding Walter, with running mate, to wagon; William Lovell enters the renowned trotter, American Girl, in harness; Mr. Crawford enters the wonderful roan pacer Copper Bottom, in harness; and owner enters the famous trotting gelding Judge Fullerton, in harness.

CRIBBING HORSES.—Mr. Lyman Thayer, of Franklin, Mass., a gentleman who has had a large experience in the care and handling of horses for the past thirty years, in answer to the question "How to cure crib-biting," says he has been quite successful by nailing strips of sheep skin on the edges of the manger, in every place where the horse could get hold with his teeth. The skin is put on with the wool side up, and if the horse attempts to play at his old trick or habit, he will find himself pretty effectually gagged. We were shown an inveterate cribber, which appeared to be thoroughly cured by this simple treatment. Mr. Thayer, like most others, considers cribbing more of a habit than anything else. The sheep's wool seems to be a little disgusting to the animal, and as he gives up cribbing in the stall, he appears to forget his habit when on the street. Cribbing is generally believed to be a habit more than a disease, although, if persisted in, it may be an indirect cause of disease.—*New England Farmer.*

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

MASSACHUSETTS ANGLERS' ASSOCIATION.—The membership of the Massachusetts Anglers' Association increases apace. At their meeting held at Codman Hall last week, ten new members were added, and twenty propositions considered.

Walter M. Brackett, Esq., offered the following preamble and resolutions which were unanimously adopted.

WHEREAS, We all feel the importance of the enactment of uniform laws for the protection of game and fish in all the different States, so far as practicable, therefore

Resolved, That the Massachusetts Anglers' Association most heartily sympathise in the movement to establish an American Protective Game and Fish Association, and that we pledge ourselves to use our best efforts to secure its success, so far as consistent with the objects of this organization.

Mr. Brackett also alluded to the extensive aquarium about being established by Dr. W. Rimmer, on Tremont street, as tending to create an interest in fish culture, and

Wimbledon have boasted of many a victory. The best blood now is undoubtedly that of Mr. Thomas Statter, of Manchester, and he is at present unsurpassed either for setters or pointers. A brace of his setters recently sold for £300 and a half broken young bitch for £130, whilst at Bala his liver and white pointer "Dick" fetched £60 on the ground. From this it may be seen that there are men in England who do not hesitate to give the price of a hunter for a dog, and I don't blame them. Mr. Lloyd Price, of Rhiwlas, who has perhaps the finest grouse moors in Wales, only to be compared with Sir Watkin Wynn's, has an immense number of well bred setters and carries off the palm at numberless field trials and shows. Mr. J. H. Whitehouse, of Warwick, is justly noted for pointers, and his lemon and whites, whilst they trace back their descent like "Blair Athol" or "Gladiator," are alike excellent in the field and at the show.

In retrievers nothing is so esteemed as the black wavy coated "Idstone" breed, imported originally from Newfoundland and slightly crossed with the intelligent Scotch colley or sheep-dog. They frequently realize the high prices of £40 and £60 and battues are seldom without one of them in attendance. There is another strain much in vogue, of a curly coat, but they do not face wet and exposure so well, and though handsome, are delicate. As for spaniels, Mr. Phineas Bullock has been every where successful, and his kennels at Belston contain some scores of beauties.

There has lately been a great discussion in the columns of *Bell's Life* as to the utility of setters in cover, "Old Calabar," (the Prince Julius de Visme,) being for the motion, and "Frank" and Mr. Webber, of Falmouth, being against it. As a setter's business is to point his game and stand perfectly motionless and cataleptic on his point, he is easily lost in cover whether with or without a bell, and his high turn of speed is useless whilst he cannot creep through runs and under briars and brambles; so I cannot see that he surpasses spaniels. There is, moreover, no breeze to carry the body scent to his eager nostrils as in the open, and as to backing another dog, that is out of the question. Of course where setters can go at a good pace and are not likely to be out of sight when on game they may be used with success.

"Dropping" at the point is a great mistake, and is becoming, I fear, an ineradicable mischief, unless rigidly denounced. It was brought in by the famous pointer "Drake," the property of Mr. Garth, the eminent Queen's Counsel. This dog on his chain was as sober looking an animal as anyone ever saw, and plain and unpretending, not to say modest in looks and general behavior, but uncouple him and he beat a falcon going down a ride, or a Chicago express, as "Eccosais," the Derby favorite, would a costermonger's donkey. Like your first edition of greased lightning he bowled along the fallows catching wind of his birds and going straight to them *entre à terre*, putting up in a cloud of dust and *lying*, (alas! not standing,) motionless as an Egyptian sphinx. He was a wonder, and being a genius, might be eccentric, like Diogenes, who lived in a tub, but though it is better to err with Pope than be right with Pye, (as Byron says in better language,) yet, Drake's "Dropping," without his speed, is a delusion and a snare. It is chiefly the result of a keeper's orders given to prevent an unsteady dog from putting up his game, although it is in some cases in setters the proper instinct of the breed, and was peculiar to them all at one time, when the net was thrown over the covey. I do not believe in the theory of its easing a dog in his work, though Mr. Macdona is a good sportsman in practice as well as in theory. Taking down wind is another fallacy often resorted to by judges to try nose and scenting powers, and a fool's errand and nothing more. No sportsman ever shirks a little extra trouble in going round to give his dogs the wind, and he is always rewarded for his pains.

Possibly some of your readers are not aware that the English *Field*, not very long ago, sent out a special correspondent to America to shoot pinnated grouse and quail and stalk the moose and buffalo on their own prairies: but such is the case, and the Hon. Grantley Berkeley, a gentleman of great renown both with pen and gun, was the man. Many were the articles he wrote and many the anecdotes he related in his graphic and pleasant style, of the time he passed and the hospitality he enjoyed in American Society. Are they not written in those thick volumes which I read so attentively at college when I ought to have been climbing up a remarkably steep Parnassus?

There is one disagreeable feature in the canine world:—It is the newspaper correspondence. Scarce is a show over or a field trial decided, before the disappointed exhibitors who can mostly neither lose like gentlemen or write like them, rush into print, and forgetful alike of all courtesy and their real subject bespatter with gross personalities every one who doesn't avoid them and unfortunately possesses a different opinion. I am glad to see that this is not yet in practice with *FOREST AND STREAM*.

I think it would be a good plan for American sportsmen to import a good English dog-breaker who would show them better the British method of training dogs, beating for game, and killing it when found, than any amount of writing. But it must be understood that I am not deprecating the knowledge of the gun in the United States but merely indorsing with regard to a united code of dog laws and the institution of international field trials.

A perusal of such books as "Stonehenge" or "Idstone" on the dog, published by Messrs. Cassell & Co., of London, would do much to illustrate how we do things on this side of the Atlantic, and no doubt you would soon beat us in sport as you have in steamers, railways and "cocktails." *Faversham, Kent, England.*

said it ought to be encouraged and recognized by the Association.

The death of Hon. Wm. Seaver, one of their most respected members, was considered, and the customary resolutions passed.

Attention was called to the pollution of Boston harbor by drainage from the city and from kerosene and the gas works.

The lobster law which went into effect May 1st, was freely referred to by S. M. Johnson, Esq. By the way, it seems, according to the Hingham (Mass.) *Journal*, that the fishermen have invented a new plan to evade this law. When they get hold of a lobster which does not come up to the proper size, they lay him on his back, tickle him under the tail with a straw till he almost bursts himself laughing, and when he has swelled up to the proper size he is suddenly immersed in a hot bath, which prevents any further shrinking, and is then sent to market.

FISH TRANSPORTATION.

LYNN, Mass., April 25, 1874.

EDITOR FOREST AND STREAM:—

I send you a plan by which I think black bass and other hardy fish might be easily transported across long distances of country with but little trouble. It is to have a round vessel made, say 2½ feet high, 1½ feet across the top, the lower part, up, say from 12 to 18 inches, to be made of galvanized iron, tin, or any suitable metal, and the remaining portion to be made of a coarse wire netting and a solid cover provided securely fastened to the top. The bottom being solid will contain water enough to carry the fish a short distance; then, while traveling by rail, the whole to be immersed in the water tank connected with the locomotive, where, through the wire netting, it would be constantly receiving fresh water. They have been carried long distances by turning the fish loose into the tender, but it is difficult fishing them out at the end of the journey.

Yours,

E. J. T.

Natural History.

—ARE ALBINOES BARREN?—The subject of albinism, which has been much discussed in this journal, is revived this week by a note from R. T. M., dated at Nassau, Rensselaer county, in which the writer says:—

"I do not think that albinos are barren, (as many state) for last summer a robin, *Turdus migratorius*, which was almost pure white, mated with one of usual color, and built a nest in a large elm tree, in the city of New Haven, Conn. Whether the eggs hatched or not I am unable to state; for I was obliged to leave the city soon afterward."

—The Oneida (N. Y.) *Circular*, April 27th, contains the following paragraph:—

"For a number of days a robin was seen on our lawn, which had the appearance of having a white head. For a bird that is so uniformly marked as a robin, this was quite a rarity; so to satisfy ourselves more fully, it was shot. Upon closer examination, it was found to be nearly white on the top of its head and also on the back part of its neck. The rest of its head and neck including its throat, is mottled with white and black. The mottling extends down on to the shoulders and wings, while the first primary on the right wing is entirely white. The bird has been stuffed and added to our collection. We should be glad to learn if any of our friends have seen robins marked in this way."

—The following animals and birds, all captured in the neighborhood of the Rocky Mountains, were forwarded by Mr. Charles Reiche, to various Zoological Societies in Europe, on board the Donau, which sailed for Bremen last week: Nine elk, four buffaloes, four Rocky Mountain antelopes, two black tail deers, some ten bears, and eight whooping cranes. Mr. Reiche states that the black tail deer are the first of the kind ever sent abroad.

—The following gentlemen have been re-elected officers of the Fairmount Park Zoological Garden of Philadelphia for the ensuing year:—

President, Dr. William Camac; Vice President, J. Gillingham Fell, James C. Hand; Corresponding Secretary, Dr. John L. LeConte; Recording Secretary, John J. Ridgway, Jr.; Treasurer, Frank H. Clark; Managers, William S. Vaux, Frederick Graff, George W. Childs, Henry C. Gibson, William H. Merrick, Isaac J. Wistar, S. Fisher Corlies, J. Vaughan Merrick, John Wagner, Theodore L. Harrison, Charles Norris, Edward Biddle.

—The *St. Augustine Press* calls attention to a stranger in their waters, about eight feet long, which is neither a shark, a porpoise, an alligator, nor a loggerhead turtle. He is to be found near Bar Creek, behind the Sand Hills of North beach. Undoubtedly it is a manatee, or sea cow. Will somebody catch him, handle him gently, and send him on to Mr. Conklin of Central Park, the only person who has yet been able to keep a manatee alive, and who has ever succeeded in making one feed from the hand. This most rare and curious specimen of the mammalia is too precious to be lost. In ten years from now, perhaps the last of the manatees will be seen in North America.

TRAPPING THE BEAVER.

RUSSELL county, Kansas, April 25, 1874.

EDITOR FOREST AND STREAM:—

Beaver are getting scarce in western Kansas. The settlers are by no means sorry, as beaver are one cause of the scarcity of timber here. Of course every one knows that they live mainly on the bark of trees, and to obtain it they cut the timber, thereby destroying a great deal every year. Sometimes they will cut down trees a foot in diameter, but usually as they cut small trees. The beaver are found mostly on small creeks, as there is but little timber along the rivers, and then the rivers dry up at some seasons so that not a drop of water can be seen, although plenty can be got by digging a few inches in the sand. I have frequently seen the Smoky Hill River that dry. We seldom find more than one or two beavers in a neighborhood. They generally build small dams of sticks, gravel and mud, seldom raising the water more than a foot or two. I have never seen the "houses" they tell about being built in the Eastern States, and old trappers here laugh at the idea. They all say that they have never seen one. I think they do not build them here, probably because they live in smaller families. They live here in holes in the

bank, the mouths being under water. There are various ways of trapping. I sometimes tear the dam open and set a trap in the break, but I prefer to find where they come out of the water to feed, and set a trap in their way. Sometimes there are small mounds or bogs that they get on. When I find one that they use I set a trap on the deepest side, as there is where they will jump into the water. Some practice fastening a clog to the trap and not staking, but I prefer to stake my traps. Care must be taken to set the trap in deep enough water to drown them when caught, and also the stake must be driven far enough out from the bank that the beaver cannot get on the bank, or he will cut off his foot and escape. The trap and chain must be covered with mud. I am using No. 2 New-house traps, but they are rather too light to drown them well. No. 3 is better, although rather heavy to pack. We get an otter now and then and sometimes a "black coon." As their skins are of little value we don't care about catching them, but they sometimes get in the traps we set for otter. The black coon is similar to the Eastern raccoon, but is darker in color, and they walk more on the sole of the foot, making a round track instead of a long one. They live in holes in the bank, the mouths being just above water. They eat frogs, fish, &c. While I am talking about trapping I will tell you how I trap hawks. The upland is covered with the short buffalo grass, while the small bottoms are full of long grass. So of course the mice and small birds stay near the long grass for safety. The hawks, therefore, look for their prey along these bottoms. I fastened some small birds to the pans of my traps and set them along the ravines. The hawk is always caught by the head. I have got some fine specimens that way.

F. S. B.

POWER OF A LION'S JAW.

WASHINGTON, D. C., April 28, 1874.

EDITOR FOREST AND STREAM:—

In one of your back numbers I noticed a paragraph to the effect that, in feeding the animals at the Central Park Menagerie, it had been noted that the lion was able to crush every bone given him, except the shin-bone of a beef, and that sometimes he could crush. Your article suggested that the force necessary to crush said bone would be a fair approximate to the strength of the lion's jaw. I therefore to-day tried the experiment. Procuring from the butchers two shin-bones of beefes killed yesterday—one said to have been between six and seven years of age, the other six years old—I placed them crossways on an iron base two inches in width, the flatter side down, in a Rodman's testing machine. The upper crushing face was one and two-tenths inches wide, and was brought in contact with the rounder portion of the bone, nearly at the centre. The first bone crushed at 2,960 pounds, the second at 3,337 pounds. In each case the direct crush was accompanied by splits extending lengthways of the bone.

It is, however, hardly likely that the lion brings to bear any such pressure. Probably the grinding motion of his jaw, and the piercing and splitting the bone with the incisor teeth, reduce the work. PISECO.

Shot Gun and Rifle.

MAY IS A CLOSE MONTH FOR GAME.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

FOREIGN RIFLE MATTERS.—The new Wimbledon regulations seem to meet with more and more dissent. The *Volunteer Service Gazette* has its columns crowded with contributions from rifle clubs, all opposed to the new targets. The Edinburgh and Midlothian, and Cumberland and Westmoreland Rifle Associations protest against the innovations. The Earl of Ducie, Chairman of the Council of the National Rifle Association, enters into an elaborate defence of the new system. The principal points in the arguments used by the Chairman are as follows: Earl Ducie states, that every year complaints of marking have been pressed upon the Council. Also that each marker being separate, they were under but little control, and that shot marks when obliterated by the white wash or paint, would under certain conditions of weather &c., re-appear again to the confusion of both marker and shooter. One objection which operated with the Council, was that the lateral marking with the long handled disc was exceedingly laborious, and that some shots were difficult to distinguish unless the marker went out to examine the target, and thereby incurred risk, and that ricochets striking near the target were given as hits, the marker not being able to distinguish them. The Chairman states that the new system of targets he does not think will make any material reduction in the number of ties, but that in shooting off ties, an advantage will undoubtedly be secured by the slight reduction of the bull's eye, and by the adoption of another division in the target. Earl Ducie concludes by asking those opposed to the measures whether they think that the council would have burdened themselves by such an operation as the change in the targets without a sufficient conviction that it would ensure advantages both to competitors at Wimbledon and to the National Rifle Association. To conclude our brief summary of this somewhat vexed question of targets, we note that the council of the Irish Rifle Association of which Major Leech is Chairman, have decided to stick to iron targets, and to adopt bull's eyes and centres of the following sizes. In the third class, centres of eight and twenty-four inches in diameter respectively; in the second class, centres of twenty-four and forty-eight inches, and in the 1st class a circular bull's eye of thirty-six inches in diameter.

PROGRAMME OF THE OPENING MATCH OF THE N. R. A. FOR 1874, TO TAKE PLACE AT CREEDMOOR, JUNE 6TH, 1874.

Match 1, *Director's Match*, 10 A. M.—Targets, 1 and 2, 200 yards; position, standing; weapon, any military rifle; rounds five, two sighting shots. Open to Directors and Honorary Directors of N. R. A.

Prizes.—Gold Badge, to be shot for annually, and held by the winner during the year.

Match 2, *Turf, Field and Farm Badge*, 10 A. M.—Targets, 3 and 19; open to members of N. R. A.; weapon, any breechloader within the rules; distance, 200 yards; position, standing; rounds, five with two sighting shots; entrance fee, \$1.

Prizes.—1st, *Turf, Field and Farm* Badge, to be held subject to competition and \$25 in money presented by the Association. 2d, Life membership in N. R. A., which may be transferred by the winner if desired; 3d, Cash, \$12; 4th, Cash, \$10; 5th, Cash, \$5; 6th, Cash, \$5.

Match 3, *Military Match*, 11 A. M.—Open to members of

the N. R. A. only; distance, 200 yards; weapon, any military rifle.

Prizes.—1st, Gold Badge, presented by N. R. A.; value, \$50; 2d, Life membership N. R. A., which can be transferred by the winner if desired. 3d, Cash \$25; 4th, Cash \$10; 5th, Cash, \$5; 6th, Cash \$3.

Match 4, 1-30 P. M.—Targets 1 and 19. Open to members of N. R. A. only. Distance 500 yards. Weapons, any rifle; rounds, seven; two sighting shots. Entrance fee, \$1.

Prizes.—1st, Gold Badge, presented by N. R. A. Value, \$25; 2d, Life Membership N. R. A., which may be transferred by the winner if desired; 3d, Cash \$15; 4th, Cash, \$10; 5th, Cash, \$5; 6th, Cash, \$5.

Match 5, *Remington Diamond Badge*, 3 P. M.—Targets 1 and 20. Open to members of N. R. A. Any rifle; distance, 500, 800 and 1,000. The twenty making the highest score at 500 yards to compete at 800, and the eight highest at 800 to compete at 1,000.

Prizes.—1st, The Remington Diamond Badge to be held subject to competition, and \$25. 2d, Life Membership in N. R. A., which may be transferred by the winner if desired. 3d, Cash, \$10; 4th, Cash, \$5; 5th, Cash, \$5.

NEW YORK, April 25, 1874.

EDITOR FOREST AND STREAM:—

Noticing in your valuable paper a number of communications in regard to the forthcoming International match, and also relative to the shooting qualities of the breech *versus* muzzle-loading rifles, would it not add to the interest of the event if a series of matches were made wherein the above question should be fairly tested? No doubt there will be a large gathering of expert marksmen from all sections of the country present at the International, and a series of other matches, at distances varying from 200 to 1,000 yards, open for all guns, would give an opportunity to many for the display of their skill, and also probably induce many to come who otherwise might remain away. Some of the best shots South have gone into practice for the match, among others Major Shipley of New Orleans, evidences of whose skill I hope soon to have the pleasure of handing you. Yours truly,

H. R. Y.

[Major Shipley's skill as a rifleman is well known to us, and we trust the Amateur Rifle Club is before this in communication with him. We should be very much disappointed if the South and West were not fully represented. No doubt but that this season in matches at short ranges the breech and muzzle-loaders will be placed in competition.—Ed.]

—The Mohawk Game Club of West Troy, N. Y., have elected the following officers for the ensuing year. Mr. H. P. Schuyler the Secretary will please receive our thanks for the revised copy of the constitution and by-laws of this club:—

President, Edward A. Meneely; Vice President, Henry C. Kelsey; Secretary, H. P. Schuyler; Treasurer, John H. Fitchett; Executive Committee, E. A. Meneely, H. C. Kelsey, H. P. Schuyler, John E. Glass, W. S. Cox.

—Reports from north eastern Ohio by Judge Ingles state that two gentlemen from Dayton killed one hundred and fifty-seven English snipe in two days. The birds were very wild, but the weather is getting milder.

—Capt. James A. Ward of Toronto, the one-armed pigeon shooter, offers to shoot at 100 blackbirds with any man in the world for \$5,000 a side, or at 50 single and 25 double birds with any man in America for \$1,000 a side. Ira Paine has accepted the later challenge.

—Dr. J. H. Ireland, champion of Long Island, has challenged Ira Paine, 50 birds for \$1,000. The match takes place at Stamford, Conn.

Rational Pastimes.

Secretaries and friends of Athletic Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

—The Sussex Cricket Club of Kings Co., New Brunswick, held the first meeting of the season at the Olive House, Sussex Station, and elected the following officers for the current year: Reverend Canon Medley, President; Dr. John Ryan, Vice President; Oscar J. McCully, Captain; J. Ernest Smith, Secretary and Treasurer; Col. E. B. Beer, Auditor. This club was only organized last year and played in one match with a Moncton club, in which it came out second best. It could not expect much else in its first match with an old club, but hopes for better luck next time. The return match is expected to be played on the 24th of May or 1st of July.

J. E. S., Sec. and Treas.

—The St. Louis Cricket Club played the first practice match, married *vs.* single, on the 24th of April. The ground was in capital condition and the weather perfect. The odds were 5 to 3 on the "unblessed."

—The Philadelphia club nine defeated the Baltimore badly in Philadelphia, on May 4, by a score of 24 to 28.

St. Louis May 3d. 1874.

The St. George's cricket club, of St. Louis, held a meeting at the Southern Hotel on Monday, the 20th ult., which was largely attended, the most important business being the adoption of its constitution. The club now numbers over 120 members, and the following are the officers elected for the current year:—President, Joseph W. Branch; Vice President, Ben. Williams; Secretary and Treasurer, G. F. Baker; F. S. Mordaunt, Captain; A. C. Bagshawe, T. Webb, Captain John S. Tildesley, Executive Committee. The club has leased the ground on which they played last season, and an adjacent house, which is being fitted up as a club house. The ground is the finest in the city, being conveniently located, with fine shade trees on its western boundary, and well supplied with water, and it is determined by the club that no expense shall be spared to make it as perfect as any cricketer can wish. The history of this club is somewhat remarkable. Last spring the St. Louis cricket club was organized, and about the 1st of June published a challenge to play any sixteen cricketers of the State of Missouri, or twenty-two of the city of St. Louis. On the 22d of June a picnic was held by the St. George's Society, and a few of its members, thinking to add to the enjoyment of the day by having a match at England's national game, improvised an eleven (not twenty-two) and accepted a challenge of the St. Louis club to play on a field near the grounds on which the picnic was held. Only one inning was played from lack of time, and the match was closely contested, the St. Louis club winning by only six runs, although the scratch eleven had never played together before. The result so thoroughly convinced the St. Georges that they had plenty of cricketing talent in the city that a club was started on the ground, and some thirty or forty names subscribed. A week later the St. George's cricket club was organized, and in a few days challenged—as a club—the St. Louisans, but were again defeated by a very few runs, the St. Georges having had scarcely any practice. A return match was played some three weeks later, in which the St. Georges were victorious, one member of that club making alone as many runs as in one whole inning of the St. Louis eleven. After this match the "United Eleven," formed from the two clubs, made the tour of Canada and the east, winning five and losing two matches, as shown in your paper of a few weeks ago. This year the St. George club has a much stronger eleven than the "United" of last season, and expect to hold their own with any club that may compete with them. Several clubs have already expressed their intention of visiting St. Louis during the summer, and a lively cricketing season is expected in the "future great city." There are no professional players in the club, all the playing members being engaged in business. The address of the secretary, Mr. Baker, is Lucas Bank, St. Louis, and any communication to him will be promptly answered. The season is very backward for this region, and so much rain has fallen that the ground has been unfit to play on up to this time, but we expect another week or so will see it in fine condition. I will post you from time to time of the doings of this club. The St. Louis club is materially stronger than last year, and has engaged the Grand Avenue Base Ball Park. Speaking of base ball, the White Stockings, of Chicago, beat the Empires, of St. Louis, yesterday, 24 to 2. The Chicago papers say they are going to turn out a cricket eleven that will wipe out their defeat by St. Louis last summer. Time will show.

BILL STUMPS.

—The professional base ball season is now in full operation, six out of the eight clubs which have entered the lists having played the first games of their series. Thus far the season opens very evenly, each of the three clubs which played championship games in April having won and lost a game, the Philadelphians losing to the Athletics, the Baltimores to the Philadelphians, and the Athletics to the Baltimores, the record of championship games for April being as follows:—

April 16—Athletic vs. Philadelphia, at Philadelphia, 14 to 5.

April 22—Philadelphia vs. Baltimore, at Baltimore, 13 to 0.

April 31—Baltimore vs. Athletic, at Baltimore, 9 to 8.

The contests for May were commenced on the 1st inst., when the New York Mutuals visited Hartford to try conclusions with the new professional team of Hartford, and, to the delight of the "nutmeg team," the Mutuals were defeated, the New Yorkers entering the arena without any preliminary practice or training such as the other clubs had benefited by. The next day the Mutuals played the champions in Boston, and they sustained a worse defeat than at Hartford, the Boston "Red Stockings" allowing them to score in but one inning only. On May 4th they played another game, and again were defeated. On May 1st, too, the Baltimores visited Philadelphia, and on this occasion they were defeated. Thus far, therefore, out of the six clubs in the arena, four have sustained defeat as well as achieved victory, the Bostons and Hartfords at present having to score their first reverse this season. The record for May to date is as follows:—

May 1—Hartford vs. Mutual, at Hartford, 10 to 7.

May 1—Athletic vs. Baltimore, at Philadelphia, 11 to 5.

May 2—Boston vs. Mutual at Boston, 12 to 3.

May 4—Boston vs. Mutual, at Boston, 11 to 4.

May 4—Philadelphia vs. Baltimore, at Philadelphia.

May 5—Atlantic vs. Baltimore, at Brooklyn, 24 to 3.

May 5—Hartford vs. Athletic, at Hartford, 10 to 9.

—The Chicago club visited St. Louis the last week in April for the purpose of having some practice games with the clubs of that city, and of replenishing their treasury with some needed stamps, the outflow having been large

since the club went into operation this season. They left Chicago fully anticipating "a walk over" while absent, but greatly to their surprise, they found that in two instances they had work to do to escape defeat. They opened play with the Empires on April 21st, and won easily by a score of 21 to 2, but on the 23d they only beat the young Red Stockings of St. Louis by a score of 6 to 0, the boys giving the professionals a very good game indeed, and in their second game with the Empires, on the 25th, the Chicago nine only won by a score of 6 to 4, the game being the best ever played in St. Louis. On the 29th they played the Turners of St. Louis, and won without difficulty by a score of 23 to 2. If the amateur, so called, nines can give the "Whites" such a close push, what will the eastern professionals do when they meet them this month? Before they left St. Louis the Whites got off some games with a lively ball, and of course won by large scores. By the rules of the Massachusetts Amateur Association, their clubs are allowed to share in gate money receipts. Wherein they differ from the professional players we are at a loss to conceive. The only legitimate status of an amateur club is that which prohibits all participation in gate money proceeds. And no player can be considered an amateur who is compensated for his field services by "money, place, or emolument." That was the amateur rule of the old National Association, in the days when professionalism was not in operation, and it holds good now. We can readily admit that a club can play on a ground where admission is charged, and yet be an amateur club, but it is only under circumstances where the club or the players do not share in the proceeds.

—The receipts at the match between the Mutuals and Hartfords, on Friday, exceeded those at the Opera House at night by a hundred dollars, the latter being crowded to see Salvini.

—The Princeton College nine opened their campaign brilliantly on March 2d by defeating the Philadelphia Zephyrs by the appended score:—

Princeton.....	1	0	0	0	0	0	2	5	1—10
Zephyr.....	0	2	0	0	0	0	0	0	0—2

No runs were earned on either side.

—The Chicagos defeated the Empires on April 29th by 30 to 9, and the Red Stockings on the 30th by 31 to 10 at St. Louis. Both were lively ball games, and poor displays of fielding.

—Will. Kelly takes his Flyaway nine by the 10 A. M. train from the Forty-second street on Saturday to fly away with the Yales at New Haven in a match game to be played there on Saturday.

—The Chelseas—amateur champions who fly a whip pennant—were expressed to Chicago on April 27th by a score of 23 to 0. On May 4th the same team encountered the Atlantics, and the result was a narrow escape from another ride to the lake city, as the Atlantics won by 23 to 1. The latter game was finely played, despite the disparity of the score.

—The Mutuals of Boston beat the King Philip nine on May 2d by a score of 10 to 0. The Crescents of Boston also Chicagoed the Unions the same day by 11 to 0.

—The Boston Excelsiors went to Andover May 2d and had a tie game with the Phillips Academy nine—score 18 to 18.

—The New York amateur Arlingtons played with the amateur Coneords, of Brooklyn, at the Capitoline grounds on May 2d, and after a long and tedious game they won by a score of 24 to 13. The umpire failed to call a "wide" during the game, though seventy odd wide balls were pitched, he rendering his decisions in accordance with the interpretation of the rules of 1873. The rule of calling "wides" is one that has been necessary for seasons past, as it justly punishes the pitcher for sending in balls out of possible reach of the bat.

—The Atlantics had a pretty practice game with the Amity nine on May 2d on the lower field of the Capitoline grounds, the professionals winning by 11 to 3 only.

—The record of prominent games—not championship contests—played since our last issue is as follows:—

April 27—Mutual vs. Chelsea, at Brooklyn, 23 to 0.

April 27—Atlantic vs. Essex, at Brooklyn, 26 to 9.

April 27—Athletic vs. West End, at Philadelphia, 62 to 1.

April 28—Chicago vs. Turners, at St. Louis, 22 to 5.

April 29—Chicago vs. Empire, at St. Louis, 30 to 9.

April 30—Chicago vs. Red Stocking, at St. Louis, 31 to 10.

May 1—Atlantic vs. Montague, at Brooklyn, 12 to 4.

May 2—Princeton vs. Zephyr, at Princeton, 10 to 2.

May 2—Arlington vs. Concord, at Brooklyn, 24 to 13.

May 2—Atlantic vs. Amity, at Brooklyn, 11 to 3.

—The arrangements for the cricket tournament at Halifax in August next are progressing favorably. A correspondent writes:—"Everybody here seems anxious to assist in making the tournament a success. A silver cup and other prizes will probably be offered, but it depends on the exertions of outsiders to bring the teams together. The managers have met with great encouragement from the leading Canadian clubs and the secretaries of the New York, Boston, and Philadelphia clubs have written, promising their assistance. A full programme will shortly be issued."

—The Saint Louis Cricket Club has challenged the Union Base Ball Club of Saint Louis to play a game of cricket, and in return offers to play them a game of base ball. The Unions are the elite of the base ball press of Missouri, and consider themselves the State champions. The Saint Louis Cricket Club are also in correspondence with the Boston Red Stockings with a view to offering the latter a little practice in the cricket field before they "beard the lion in his den."

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, trails, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

H. B. P., Boston.—Can obtain you a copy; price \$1.

SALMO, Scotia, N. Y.—Roosevelt's "Game Fish of the North," \$2, but out of print. Do not know prices of other books.

W. Q., Mobile, Ala.—Who can supply good stock carrier pigeons and at about what price? Ans. G. Obrig, 276 Grand street, Williamsburg, New York.

D. E. F., New York.—The books you require you may get of Messrs. Wood & Co., Great Jones street, N. Y. The publishers in Philadelphia have no agents here.

LIEUT. E. O. H., San Francisco, Cal.—The statement of size of target in the Report of the National Rifle Association of 1873 is a typographical error. It should be six feet by four. We forwarded you a card.

J. L.—Where can I get working plans and specifications of a steam yacht, side-wheeler? Ans. The New York Safety Steam Power Co. make a specialty of steam launches, and could no doubt fit you one with side wheels.

AD. PAUL, St. Louis, Mo.—Please mention in Answers to Correspondents, if possible, the weight, cost and builder of Barnegat duck-boat? Ans. Don't know; for particulars address the owner of the boat, Robt. B. White, Shrewsbury, N. J.

W. D. K., Yarmouth, N. S.—What are the proper dimensions for a single scull race boat for a man weighing about 160 pounds? Ans. The boat should be not much less than 12 inches wide and about thirty feet long, if the man has long arms and legs and uses a sliding seat.

TARGET, Phila.—Gun 12 gauge, 1½ oz. No. 7 shot, target 30 inches square—that is, diameter 30 inches—distance 40 yards. How many pellets should be put in the paper to be considered first-class shooting? Ans. You do not state weight of gun or how much powder is to be used.

AJAX, Fredonia, New York.—My Newfoundland dog drools constantly. He is ten months old and I feed him on meat. What shall I give him or feed him? Ans. Give him six Brandeth's pills, reducing the quantity every day. Feed him on broth and table refuse. Please give best weight for 38-100 cal. Remington rifle? Ans. 8 lbs.

NEW SUBSCRIBER, Cape May, N. J.—1. What is proper charge of powder for double-barreled muzzle-loader, 30 in. barrel, 12 gauge, fine laminated steel barrels? Ans. 2½ drachms. 2. What kind of powder best for proper charge you mention? Ans. See advertisement. 3. What kind of wad best for next to powder? Ans. Pink edged.

A. B. H., Peace Dale, R. I.—The subject you speak about shall have our immediate attention. Hope in the next number to commence a series of articles on the subject. Crowded condition of our columns has prevented as yet. We want to do all we can to re-introduce this noble sport, especially for the sake of our many lady readers.

CRICKETER, Kings co., N. B.—The rules of cricket say that a player is out if the ball be struck and he willfully strike it again, but cricketers here contend that if a player strike the ball and it fall to the ground and run into the wicket, then he can strike it again in order to keep it out, on the ground that he can guard his wicket at all hazards? Ans. A player, when he is on his ground, can stop a ball, after he has hit it, from twisting upon the wicket, but with his bat only.

F. W. B., Boston, Mass.—Can you inform me where I can purchase a greyhound dog pup; if so, the price, and will you please send me the list of prices which they ask for the pointer and setter pups referred to in your paper of March 23, 1874? Ans. Perhaps some of our subscribers have a greyhound pup to dispose of. Laverack pups, \$60; Idstones or Gordons, £5 to £10; Price's pointer and setter pups, £6 to £12; Macdonald's, £7 to £10; also some fine American bred pups by an imported dog, \$15 each.

A. H. W., Boston, Mass.—1. What is the best artificial whistle for calling bay snipe? Ans. Carefully dry the leg of a curlew, push out the marrow with a red hot knitting needle, plug up one end and then practice. 2. What is the price of the patent inflated rubber stools? Ans. Write to John Krider, corner Second and Walnut streets, Philadelphia. 3. Are there any hotels on Montauk Point, where plover shooting can be obtained? Ans. We believe there is a tavern where every convenience can be obtained.

JUNIATA, Huntingdon, Penn.—I see in your paper of April 23, in reply to Subscriber, as to the best load for a 10 bore, 10 lb. breech-loader, you tell him to use a concentrator. Are they of much account and would they be of service in shooting buckshot? Where can they be obtained, and are they easily put on, or removed at will? Ans. Concentrators are useful where the sportsman is a first-rate shot, and can be used with any single shot. They are easily put in the cartridge and removed at pleasure. You can procure them at any gunsmiths.

SWAMP ANGEL.—I have a splendid setter about two years old, trained by another party, but on trial find he is gun shy, and at a report runs away and nothing can bring him back. I have also added an English pointer to my stock lately, who knows his business very well indeed. What I wish to know is, what shall I do with this setter under the circumstances. He is a splendid looking animal, and if possible I wish to break him in. Your experience may enable you to tell me of some way to do this? Ans. See FOREST AND STREAM April 2d, "Gun Shy Setters" by "Homo."

BLACK RED, New York.—1. Where within 30 miles of New York City can a good day's shooting be found, between 1st of June and 1st of November? 2. What game to be found there? 3. Where can I procure a good fox terrier pup under \$30, and how much should I be asked? Ans. 1. There is no shooting in June. Woodcock shooting commences July 4th, on Long Island, at Smithtown. 2. We do not know where you could procure a fox terrier pup; it is a dog almost out of use, and bred only for show and companionship. You will notice italics at head of this column.

LOUIS A. LELAND, Colon, Mich.—Where are the Tontari Lakes, and what is the best route by which to reach them from Portland? Ans. Take Grand Trunk Railroad via. Richmond, Canada, to Quebec. At Valcartier, distance 30 miles from Quebec, Mr. Charles Wolff will welcome all sportsmen and secure all guides for the Tontari Lakes. They are one and a half day's journey from this, the farthest settlement north of Quebec. For fuller information refer to Nos. 18 and 25 of vol. 1 FOREST AND STREAM, under "Summer Sports in Canada." We will publish shortly a complete guide to this region.

H. E., Pittsburg, Penn.—Please inform me of the best remedy for a dog that is troubled with worms, also the best mange remedy? Ans. Powdered aloes, 16 grains; powdered scammony, 8 grains, to be divided into four to eight powders, according to the size of the dog, and one to be given every morning made into a ball with linseed, meal and molasses. In six hours afterwards give the following injection: Spirits of turpentine, 2 drachms; olive oil, 2 ounces. For the mange, cleanliness is the first desideratum. Let the dog be well washed with soap and water, and when perfectly dry anoint the parts affected with the following ointment: Sulphur vivum, 4 ounces; Hellebore powder, 2 ounces; bayberry powder, 2 ounces; spirits of turpentine, 1 ounce; hog's lard, ½ pound. Or, a proper muzzle having been applied to prevent the dog biting himself, the following wash is recommended: Decoction of white buckthorn, 4 ounces; decoction of tobacco, 4 ounces; corrosive sublimate, 5 grains; aloes, 2 drachms. Mix while hot. The aloes are added as a mere extra precaution to prevent the dog from licking himself. The washing and anointing must be repeated every second day. Strong solution of soda will remove all trace of the ointment.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK, and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "FISHING TOURIST," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, MAY 7, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, May 8th.—Sacramento Agricultural Society (Cal)—Athletic B. B. of Philadelphia vs. Atlantic of Brooklyn.

SATURDAY, May 9th.—Capital Jockey Club, Austin, Texas—Sacramento Agricultural Society—Harlem River Boat Clubs practice day—Cricket Clubs practice day—Athletic B. B. vs. Mutual of N. Y.—Fly Away of N. Y. vs. Yale College.

MONDAY, May 11th.—Nassau Boat Club vs. Harlem Rowing Club on the Harlem River—Kentucky Association, Lexington, Ky.—Weston's walking feat at the Empire Rink.

TUESDAY, May 12th.—Mystic Park, Boston, Mass.—Kentucky Association, Lexington, Ky.—Point Breeze Park Association, Philadelphia, Pa.

WEDNESDAY, May 13th.—Kentucky Association, Lexington, Ky.—Mystic Park, Boston, Mass.—Point Breeze Park, Philadelphia, Pa.—Boston B. B. Club vs. Hartford, at Hartford, Conn.

THURSDAY, May 14th.—Mystic Park, Boston, Mass.—Point Breeze Park Association, Philadelphia, Pa.—Kentucky Association, Lexington, Ky.—Boston B. B. C. vs. Mutual at Brooklyn.

THE GAME LAWS.—Royal Phelps, President of the Sportsmen's Club, sued J. H. Racey for a violation of the acts for the protection of game, for having in his possession quail and pinnated grouse during the prohibited period. The defendant answered substantially that the quail which he had on the 19th of March had been killed before the close of the season and preserved by a patented process. The Court of Common Pleas at Special Term held the answer bad, and the General Term, on appeal, now sustain that decision on the ground that after the 1st of March the possession itself is forbidden under penalty. The Court holds further that the act is clearly constitutional. This decision of the General Term of the Court of Common Pleas is a most important one, and must be considered as the proper ruling for all other cases of infringement in the Close Season.

THE DOMINION TEAM FOR WIMBLEDON.—The Council of the Dominion Rifle Association have determined to send a team of twenty men to the Wimbledon competition this year, and have decided to select one man each from Manitoba and British Columbia, the remaining 18 from the best shots of Ontario, Quebec, New Brunswick and Nova Scotia. Each province will send to the Secretary of the Dominion Rifle Association, on or before the 20th of May next, the names of 18 marksmen who are willing to be put on the team, together with their score made at the Provincial matches of last year. From the 72 names thus obtained, the selection will be made, irrespective of locality.

TIME OF THE INTERNATIONAL MATCH.—A letter has been received from Mr. Leech suggesting that the Irish match be held during the last week of September or the first week in October.

HINTS ON MOUNTAIN TRAVEL.

AS many of our readers are booked for the Rocky Mountains next summer, the following information may be of service. The writer has been "there":—

Before entering the mountains one should prepare himself and party for the country they are about to visit, for if their outfit is not carefully selected, what might have been a summer's pleasure will very likely be one of toil and regret. Take nothing but what is absolutely needed, and what is taken let it be as light as possible, as every extra pound lacerates the back of the pack mule. Use medium sized animals for packing, as they will carry as heavy a pack as a larger animal in rough places and are more to be relied upon where there are steep ascents to be made or fallen timber to be crossed. Two hundred pounds is enough for a single pack mule to carry at once, but some persons will overload their animals to save buying an extra mule and will not see their folly until they have lost some of their best animals by rolling down hill sides against the rocks or by having them "snagged" in fallen timber. When returning at the end of the season, if the animals' backs are sound and good from the effects of light loadings, they will demand a good price and are easily disposed of; but if on the contrary, their backs are covered with sores, they will only bring one-half their original value, so men may easily see the economy of having a sufficient number of animals to carry their luggage.

For riding animals use mules for the mountains and horses for the "plains." A good mule will follow a trail and take its rider into camp the darkest night that ever was. Should you get strayed away from camp and not be able to find your way back again, drop the bridle rein on the horn of your saddle and trust to the instinct of your mule, and if it is not very hungry, after wandering about a short time it will take a direct course for camp, although the rider may think camp is in an opposite direction from the one where the mule is taking him. The common Indian pony or bronco is the best horse to use on the plains, as they are tough, quick and thoroughly acclimated to cold weather and the poor feed that is to be had in most places. Select an easy saddle with a good California tree, a light pair of spurs, and a broad hair Cincho bridle with a light curb bit, a good saddle blanket, a small pair of saddle bags, and your riding outfit is complete, unless you ride a mule, and in such a case a good strong broad crouper is necessary, so it will not cut the tail of your riding animal. When traveling do not hurry your horse, or do not allow him to become lazy; keep him at a steady gait, and if necessary, he will accomplish a long distance daily; but should you become impatient and lope him nearly all day, he will become poor, stubborn and lazy. Use the Spanish arrap ahoie instead of the pack saddle, as it is easier packed and more comfortable for the animal wearing it. Select heavy lash ropes, or they will stretch and the animals will have to be repacked a dozen times a day, particularly after a rain, when the ropes have been wet and are gradually drying by the heat of the sun. Have a long "lariat" for each animal, for in some places in a timbered country it will be necessary to picket them over night, for if they were turned loose they would stray through the woods in search of better feed, and it would be a severe task to collect them together again. Put a cow bell on the neck of the gentlest mare, and the whole herd will become attached to the animal wearing the bell; and when traveling let the "Bell mare" take the lead and the other animals will follow in single file where it would be impossible to drive them. The cooking utensils should be several camp kettles made of copper and lined with tin, (made to fit in each other so they may be more easily packed,) a small Dutch oven, spade, axe, hatchet, coffee mill, knives, forks, spoons, tin plates and cups, a bread-pan, frying-pan, gridiron, whetstone, and two small iron bars to lay over the fire to set kettles on when cooking.

The bedding for each person should consist of four California blankets, a small pillow, a rubber Poncho, Buffalo robe, and half a wagon cover of canvas to cover the whole bed and protect it from the rain. If tents are used, the small dog tent is the best, and will be found very useful as a wrapper to roll the bedding in for packing. For hunting large game, use the Gove Rifle, of Denver, or the Sharps from Hartford. There should always be one good double-barreled shot gun in a party for the smaller game, and thus provided for, there is always an abundance of fresh meat to be had, which is a great addition and saving to the table. When a party is preparing to camp out it is a good plan to establish a depot camp for a few days near some town, (where there is good water and wood,) while fitting out, and become accustomed to camp life before striking out for the more wilder portions of the country. The experience thus gained proves a good guide for future operations. When starting out for a distant point do not travel too far the first few days, but make short marches until the animals' backs become hardened to the arrapahoe. Do not allow the arrapahoe or pack to become loose, but have them as tight as two men can draw them. A mule may grunt a little about being laced so tightly, but it is much better for them than to have a pack rocking from side to side, backward and forward, thus bruising the mule's back and ending in sores and a worthless animal.

—The Class of '75 of the Steven's Institute of Technology is about to issue the first number of a college periodical, to be known by the suggestive title of "Eccentric." This will be under the editorial and executive direction of each succeeding Junior Class.

THE ORIGIN OF A ROYAL HUNTING ORDER.

IN those warlike times, when much of northern France was held by the English, and skirmishes, surprises and ambuscades were of daily occurrence, when many a noble feat of arms was held, when good men died helm on head, and sword in hand, it happened in Aquitaine of a cheery autumn morning, that the Dauphin, son of Phillip III, called the Brave, accompanied by a few gentlemen, all true knights, went on his way, with goodly escort, to hold wassail and carousal at a neighboring castle.

"A bright morning, my Lord Prince," said Claude Potier, a young gentleman from Languedoc, as he rode up and gracefully lifted his plumed bonnet.

"A fair day, good Claude. It pleases me to have you in our company. A good horse thou ridest there. 'Tis true that thou art light weight. Has't not donned thy coat of mail? It is not safe that thou should'st ride without helm or corselet—even to save thy steed. These Englishmen shoot arrows from afar. 'Twere better to be on thy guard," said the Prince.

"Thanks, my lord, for counsel. In truth I heed it, for somewhere follows my esquire, who bears my coat of Milan. But of such a sweet morn' as this—save to take heed of passing deer or flying birds, 'twould seem to me to be out of place to think of sword thrusts or clang of arms."

"What geer hangs thou that thy saddle bow?" asked the Prince, smiling.

"'Tis my bird-bolt. 'Twas sent me from Italy. In Venice they are most cunning in matter of fashioning smaller arms. You see, my Prince, the old hunting fever still flushes through the blood, and should a good moor cock with whirring wing fly from yon thicket, why, by your gracious leave, I needs must bring him down."

"Art skillful that way?"

"'Twere ill fitting that I should vaunt a cunning, which all gentlemen in fair Languedoc possess—nor would I press my skill, fearful my Prince might think that he who is adroit with bird bolts, and cross bows, rather a foot soldier's arms, should have no prowess with the nobler weapons of knight, the lance, the sword, the mace."

"May we prove thee a staunch forester and true knight, my good Claude Potier. But see, yonder copse, mostly has a brood of moor cocks in it. Of sunny days, as passing this way, I have seen the brood rise, and the parent birds flutter and strut, warming themselves in the morning sun. Now, canst then try thy skill?"

Just then a goodly bird rose for a moment above the green fringe of thicket. The Languedoc gentlemen, deftly taking his cross bow from its sling, adjusted it and moved his horse quietly toward the covert. Up rose a noble bird, with afrighted wing skimming swiftly above the tops of the lower trees, but not more quickly twanged the string or flew a bolt, launched with unerring skill. The russet bird stood, poised for a moment in mid air, then stone dead, swaying about with out-stretched wings, slowly fell, and sank with scarce a feather ruffled on the green sward.

"By St. Hubert!" cried the Dauphin, "a brave shot and a true one, my gentleman from Languedoc."

Off sprang Claude from his horse, picked up the moor cock, and attaching the bird to a ring in his gorget, slung the game behind his back, then pricked his steed to join the Dauphin, who was now a bow shot in advance. Suddenly Claude saw his young leader rein in his horse and unsheath his sword. In an instant Claude was by his side.

"There is danger here, my gentleman. In yonder bosquet I see full a score armed men, with vizors down and pennons on lance. It is a trap for us. How far off ride our gentlemen?"

"My Prince, full half a league behind."

"Ride then for thy life! Thou art better mounted than I am, and bid them prick on."

"Never. It is thou who shalt ride back my Liege Lord. 'Tis my place to stay. Quickly, I pray, my Prince, for now are they on us."

"Thou wilt lose thy life and thy moor cock," said the Dauphin, smiling.

"I trow not," cried Paul, drawing his sword, and shouting, "St. Denis! St. Denis! a Rescue!" and covering the Dauphin with his person. With a rush on came the Englishmen at arms, crying, "St. George!" and the old chronicler tells how lustily they played the noble game of swords with *estoc* and *taille*. Paul fought like a lion in defence of the Dauphin. Foot by foot the ground was disputed, sometimes it was the Dauphin who was in the lead, then it was Paul; but whenever Paul went, fluttering from his back hung the moor cock.

"Eh, thou gallant," cried an English knight. "Art thou a good-wife, bringing her chicks to market, with thy goslings slung behind thee?"

"Have at thee, then, foul-mouthed man," cried Paul. "I make game of thee as of this bird;" as with his bird bolt he let fly a tiny shaft full in the visor slit of the opprobrious knight, which shot, says the story teller of the time, did so splinter the teeth of a knight, famed for his comeliness, likewise gash his lips and otherwise disfigure his fair face, that ever since that time he never held sway in lady's bower.

It might have, however, fared badly with the Dauphin and his single follower, if it had not been for the approach of the Prince's escort, who, in a twinkling, cleared the field of the enemy.

"Thou has't saved my life Claude Potier. Has't thou still the moor cock?"

"Yes, good Prince, and scarce a feather lost."

That night, midst revelry and song, the grand old Castle Hall sounding with joyous cries, healths were drank, and a noble banquet was served to the Dauphin and his gentlemen.

"Bring me Seneschal," cried the Prince, "Yon dish."

"'Tis a moor cock, so may it please you," cried the Seneschal; "Cooked Provençal fashion, with all his elegant plumage. In the sauce, my Prince, is choice wine. 'Tis a noble bird when prepared with skill."

"Rise, Sir Claude Potier. In thy honor—for thou did'st save my life—I make thee knight and create for thee the noble order of the Cock. Thou shalt be the first knight. I believe that thou wilt uphold its honor," and drawing his sword the Dauphin dubbed him knight, then carving the moor cock with his own hands, served the good knight Claude.

Such was the origin of this order of the Cock, founded in the year 1214. It existed for fully three hundred years, and was sought after by many a gallant Frenchman in times long past away.

TRESPASS AND GAME PROTECTION.

THE FOREST AND STREAM has been the recipient of innumerable letters from correspondents in regard to the game laws and the protection of game. We are afraid that in some instances we may have been considered indifferent or neglectful in not replying to or reproducing them, but we beg to assure our friends that not a single letter has been overlooked. Certainly, no person can be more directly interested in these important topics than ourselves, and we do not think it egotistic on our part to assume that the efforts which we have made and will continue to make in this direction will in time bear their fruit. But we regard the whole subject as one by no means easy of solution, or to be treated superficially, and we have preferred, instead of attempting to adjudicate upon intricate legal points ourselves, not being learned in the law, to turn the whole correspondence over to an eminent jurist, who for acumen and a thorough knowledge of the game laws of this and other countries, stands among the first in his profession. We take, then, great pleasure in directing the attention of all societies for the protection of game and of sportsmen in general to the article which follows, believing that it is the first time that this question has ever been exhaustively and comprehensively handled by a competent jurist:—

Believing that the FOREST AND STREAM "will pander to no depraved tastes, nor pervert the legitimate sports on land and water to those base uses which always tend to make them unpopular with the virtuous and the good," it seems now to be selected as the legitimate vehicle to convey some matured reflections on the necessity for and constitutionality of laws for the protection and preservation of game, and the views and opinion now presented will, it is to be hoped, quiet the fears and apprehensions of every law-abiding citizen, of every honorable sportsman, and be only distasteful to the pot-hunter and the poacher.

Game laws of one kind or another exist in all modern countries, and in recent times the tendency seems everywhere to be to render them more stringent. The game laws of England, Ireland and Scotland, although somewhat distinct, agree in their most important provisions. The English statutes now in force go back to commencement of the reign of William the Fourth and run along with various amendments to 25th Victoria. The common law is interwoven with those statutes. The old common law doctrine that the sole right of hunting and killing game belonged to the crown, has been shewn to be erroneous, and it is now settled that at common law the owner of the soil, or if he has granted a lease without reserving the right, then the lessee or occupier has the right to catch and kill every wild animal that comes on his lands, but the English, Irish and Scotch statutes have made it necessary that the owner or other person having the legal right, shall before exercising that right, take out a game license. Not only is a game license necessary in all cases, but there is a certain season called the close season, during which it is unlawful for any person, whether having the legal right or not, to catch or kill game. Those statutes embrace every species of game bird and game fish enumerated in the game laws of this State, and in addition, humanity and public policy, prompted an English parliament to extend the legal shield of protection over the eggs of all game birds and over the ova of all game fish. There is also in the United Kingdom a day-poaching act and a night-poaching act, which is described as too severe, but on the other hand it is answered that poaching is in reality only stealing under a milder name, and that the classes who poach are divided by a thin partition from thieves.

Vide Patterson's game laws, but this is not an appropriate occasion to waste time on those thieves and vagabonds, those pests of society who are deservedly abhorred by every honorable sportsman. To them may be aptly applied the calumniating apostrophe of Somerville in his illusion to coursing—

"The mean murderous crew
Intent on blood and spoil."

Having thus incidentally referred to the game laws of "Great Britain and Ireland" it may be proper to state that while those laws are represented to be far too stringent to be badly administered by interested justices and to be opposed to the moral sense of the lower classes, their constitutionality has not been questioned, and although Mr. Bright, the great advocate of the peoples' rights, obtained a committee of the House of Commons, who examined the subject, the game laws still remain in full force to adorn the statute books of Great Britain.

Game laws have been enacted, and appear in the statute books of twenty-four States of the United States. It is not here intended to point out the crudities and absurdities of many of those statutes or to show that they in some instances tend to defeat the very object intended to be accomplished; it is sufficient to state that the remedy lies in co-operative legislation and in a simplified code, a scheme thoughtfully considered and ably presented by Mr. Charles Hallock at the Convention of Fish Culturists in February, and by that scientific body of gentlemen unanimously approved and adopted. The subject is now before the "Game

Protective Society of New York," by whom the proposed remedy of co-operative legislation will in a short time be submitted to all the scientific and acclimating societies and sportsman's clubs in the Union.

The law of this State for the protection of game, although imperfect in some respects, being, it is believed, better adapted to meet the desired object, being more stringent in its provisions, and more strictly curtailing and infringing private rights than the laws of any other State, is selected as an appropriate theme in the hope of satisfactorily answering the numerous inquiries of friends and removing the objections of skeptics and enemies. The act is entitled, "An act to amend and consolidate the several acts relating to the preservation of moose, wild deer, birds and fish." The 7th and 20th sections are selected as the most prominent features of the statute which have excited the hostility of land and water proprietors. The sections are as follows:—

§ 7. No person shall kill, or expose for sale, or have in his or her possession, after the same has been killed, any quail, between the 1st day of January and the 20th day of October, under a penalty of twenty-five dollars for each bird.

§ 20. No person shall kill, or expose for sale, or have in his or her possession after the same has been killed any speckled trout, save only from the fifteenth day of March to the fifteenth day of September under a penalty of twenty-five dollars for each fish. But this person shall not prevent any person from catching trout in waters owned by them to stock other waters.

There can be no doubt that these legislative enactments actually prohibit and were intended to prohibit the killing of quail or the catching of trout by the proprietor on his own premises during certain months of the year.

1st. The very language of the statute does this. "No person shall, &c.," is the most comprehensive mode of expression which the law can make use of, and being in this case unqualified and unrestricted by any limitations whatsoever, must be taken to mean what it purports to be on its face, a general prohibition to all persons.

Besides the proviso in section 20 to the effect, "But this section shall not prevent any person from catching trout with nets in waters owned by them to stock other waters," clearly shows that the legislature intended to include such owners among those prohibited from doing the acts mentioned in previous parts of the section, otherwise there would have been no necessity for an express proviso in their favor. "*Expressum facit cessare tacitum.*"

2d. It is one of the cardinal rules of construction that the legislature in enacting a statute intended it to be valid and effectual. Hence, it was certainly intended to extend the general prohibition in the statute under consideration to acts done by proprietors on their own premises, for otherwise the purpose of the statute—the preservation of fish and game would not be attained. If every man could kill and destroy at his own option what the statute was intended to protect, what need would there be of any statute? If the statute does not apply to all, it is without the breath of life, it is then a still-born statute. The statute thus evidently applying to all alike, whether the proprietors of the premises where the prohibited acts are done or not, the only inquiry which remains is, Has the legislature the constitutional power to pass such a law; and is it not in conflict with the constitutional provision that no man shall be deprived of his life, liberty or property without due process of law?

In order to understand the bearing of this inquiry it will be necessary to examine into the nature of property in animals.

Blackstone, following closely the classification of the civilians, divides property in animals into "*absolute and qualified*," the former attaches to domestic, the latter to wild animals, or such as are *domitiae*, and such as are "*ferae naturae*."

Of the former, it is not necessary to speak in this connection. Animals "*ferae naturae*," become the subject of a qualified property when reclaimed by the art and power of man, (Kent 2, p. 348); or as Blackstone says, "*per industriam*," Blackstone 2, p. 391; but when they escape from his keeping and regain their natural liberty without the "*animus revertendi*," the property in them ceases, (*i. d.*) While this qualified property continues it enjoys, like any other kind of property, the full protection of the law. It is felony to steal animals "*ferae naturae*," provided they are confined or reduced to tameness, (East's, P. C., 16, § 44; Hawk, c. 1, c. 33, § 26.) Mere pursuit and being in view of the animal does not create a property, because no possession has been acquired, (Pierson vs. Post, 3 Caines, x75 and Berster vs. Newkirk, 20 Johns, 75.) So far does the common law go in protecting this qualified property in animals, "*ferae naturae*," that an action on the case will lie for wilfully frightening away the wild fowl from the decoy pond of another, for a person keeping up a decoy expends money and employs skill in taking that which is of use to the public. It was considered by Lord Holt as a description of trade, (Keeble vs. Hickeringill, 11 East, 574; 2 B. & C., 943.) But unless something is actually done to bring such animals within the power and control of man they are like air and light common to all by the law of nature, (Kent 2, p. 348.) Hence they are not grantable by the common law. "Such things as are '*ferae naturae*,' as conies, hares, deers and such like are not, (while in an unreclaimed state,) grantable at all," (Priston's Shepard's Touchstone, p. 241, "tit grant." Nor for the same reason can larceny be committed of such animals? (Blackstone 4, p. 235.)

From these considerations it follows that the statute in question invades no right of property. It relates to animals "*ferae naturae*," which are still at liberty and not in the keeping of any individual. It prescribes the mode of exercising a right of property not yet acquired. Its provisions become a condition precedent to the acquisition and exercise of any such right. "Nor does such a statute work any natural injustice; since the law does not hereby deprive any man of his present property, or what was already his own, but barely abridges him one means of acquiring a future property, that of occupancy, which indeed the law of nature would allow him, but of which the laws of society have in most instances very justly and reasonably deprived him," (Blackstone 2, p. 412.)

This, then, is the negative argument in favor of the constitutionality of the game law, as statutes like the one under consideration are called; the positive argument in favor of its expediency is, that it tends to the public good. It must be confessed that this consideration had little weight with those who framed the earlier English Game Laws, for the confessed object of these men was not to consult the good of the community but to protect the privilege of a class. The common law nowhere shews stronger traces of feudal

influence than in its rules and doctrines concerning such animals, "*ferae naturae*," as are known by the denomination of game. The property in these, with the right to pursue, capture, and destroy them, vested in the King alone, and in such of his subjects as had derived their rights from him by grant. In this it differed from the civil law, which recognized no distinction of animals into game, nor the right of property in them as belonging exclusively to any class or set of individuals. The provisions of the common law on this subject were, after the conquest, barbarous in their stringency, and the penalties attached to any, or even the slightest violation of them, were atrocious. This arose from the passion of the Norman kings for hunting, which was so strong that they often risked their crowns to preserve this prerogative intact. They enacted the renowned forest laws, by which a legal sanction was given to the most tyrannous cruelties, and which were among the chief grievances complained of by the Barons as well as the Commons. These stringent game laws, or forest laws as they were then called, played no insignificant part in the development of English constitutional government, for they were greatly instrumental in effecting that union of the aristocracy and the commons by which the absolute prerogatives of the Crown were limited, and the supremacy of Parliament was finally established. But for whatever reasons game laws may have been originally enacted, they can be supported in a free and republican government like our own only on the ground of a public benefit. Their object here in this country is to preserve those species of animals known as game which would soon be extirpated by general liberty. They protect from indiscriminate slaughter those animals which serve the public as a valuable article of food. They preserve that which is of use to the public, for such, in Lord Holt's opinion, is game, (Keeble vs. Hickeringill, 11 East, 574; 2 B. & C., 943.) Game laws are therefore enacted for the good of the community, and as such they should be upheld and carried into effect.

The absolute necessity of such laws has long been felt in all the eastern and many of the western States. In the former game may be said to have almost disappeared. The wild turkey is extinct, and quail and partridge are becoming scarcer every year. If the wholesale slaughter of deer continues for only a short time longer, the chapter on deer in the United States will be as suggestively brief as that on snakes in Ireland—"there are none." Under these circumstances it is not to be wondered at that game, as food, has become an expensive luxury, which the rich alone can afford, instead of a common article of food, within the means of all. It is said of Henry IV., of France, that the aim of his administration was to enable every peasant to have a fowl in his pot. It may be said with more truth that it is the object of the game laws to place game on plebeian as well as on aristocratic tables.

It remains to consider in detail the provisions of the statute as to the catching and killing of trout, and their effect upon the rights of owners of fisheries.

The subject of property in fish is discussed in Shultes on Aquatic Rights, where they are classed among "*ferae naturae*," and on the authority of Bracton are said to become the property of the first taker. Fishes are "*Animalia quae in mari nascuntur quae cum capiuntur captoris fiunt*" (Bract., 1 lib. c. 12, § 10; 2 lib. c. 1, § 2), and the rule of occupancy relates to fishing as well as hunting and other acts of acquiring ownership. But it must be remembered that the right to take is something distinct from the right of property in animals, (*ferae naturae*.) A man may have the sole right to hunt on his own land, and yet have no property in the game unlawfully killed on his premises by B. "It is clear that if a man pursue hares or other animals out of his lands, or the lands of another, into mine, and there take them, they are the hunter's, and not mine, because I never had any original property by inclosing them," (3 Bac. Abc. tit. Game.) A man may possess the exclusive right to catch fish, as in the case of riparian proprietors, who own in streams, not navigable, "*usque ad filum aquae*," or he may own the land on both sides of such a stream and thus, by the common law, become the owner of the water, and yet in either case he has no property in the fish till caught or brought under his control. They are "*ferae naturae*," and the circumstance that they live in the water which flows over his land no more confers a right of property than does the fact that partridges fly through the air over his premises. It was for this reason that by the common law no larceny could be committed of fish in an open river or pond, (Blackstone, 4, p. 235.) It is therefore apparent that the provisions of the game law, as to the catching of trout, deprive no man of his vested property, and are therefore constitutional. The Supreme Court of this State, in Hooker vs. Cummings, 20 Johns, 90, speaking of laws similar to the one in question, says:—"The legislature have, confessedly, the right of regulating the taking of fish in private rivers, and do every year pass laws for that purpose, as to rivers not navigable in any sense, and which are unquestionably private property." To the same effect see Kent 3, p. 418. For such laws are for the public benefit, to preserve the fish, and are public statutes, of which the courts must, *ex officio*, take notice, (Burnham vs. Webster, 5 Mass., 266; Commonwealth vs. McCready, 5 Mass., 324.)

There is one case mentioned by Blackstone where there is a property in fish, and that is of fishes found in a tank (Blackstone 4, p. 235), for in this instance they are so closely confined that they may be said to be reclaimed "*per industriam*." For the same reason a man owns the fishes in his fountain or in his aquarium. In such a case they are like deer in a park or pheasants in a mew, no longer "*ferae naturae*."

It is not strange that this subject is so little understood by the great majority of our citizens. We are a restive people. We live in a democratic region, under a form of government in which the supreme power is lodged in the hands of the people collectively; a form of representative democracy which de Tocqueville and Mill labored to prove as developing in the greatest degree the good mental qualities, both intellectual and moral, of the governed. This may all be true, but the daily violation of law, and the restive spirit shadowed forth in the pile of letters which encumber the editorial table of the FOREST AND STREAM, is not evidence of that development of mental and moral qualities of the governed predicted by the Frenchman and the Englishman.

In one of the letters referred to, an extract is given from the Manchester, Vermont, Journal, as follows:—"It was the opinion of the late Judge Steele, who spent some time investigating the subject, that the common law, which, in the absence of the statute law, governs our State, secures to

each landholder the control of the fishing upon his own enclosed land."

Judge Steele was an able, an upright, and an accomplished jurist. His death was lamented, and he was an irreparable loss to the judiciary of his State, and if space permitted, the letter of the intelligent gentleman, from which the above extract is taken, would be inserted. The language and opinion of Judge Steele is in perfect harmony with the common law and statute law of every State in the Union—"the landholder and the land owner controls the fishing upon his own enclosed land." Trespass is the technical as well as the popular name for that kind of injury which is done to a man's land or house by intruding upon it against his will. The maxim is familiar that every man's house is his castle, and he is entitled to regard as an enemy every person (with few exceptions) who attempts to enter without permission, and this general rule is applicable to a man's land as well as his house. Judge Steele was correct in vindicating the right of the land owner to the fishing upon his own enclosed land, but if the land owner had no right of property in the fish (as he had not if they were "*ferae naturae*") which lived in the water flowing through his land, he had just the same control over them as he had over the birds which flew over his premises, and the legislature had, and has, the constitutional right and power to protect every species of animal of fur, feather, or fin, in its nature "*ferae naturae*," from reckless or inconsiderate slaughter or capture.

The land owner has the control of the shooting and hunting on and over his own land. It is the land itself which gives the right, but a man who finds game on his own land cannot justify pursuing it into the land of another. If A starts a hare in the land of B, and hunts and kills it there, the property continues all the while in B, but if A starts a hare in the grounds of B, and hunts it into the ground of C, and kills it there, the property is in A, the hunter, but A is liable in an action of trespass for hunting on the grounds of B as well as C.

In the case of a private fresh water river, in which the tide does not ebb and flow, he who owns the soil has, *prima facie*, the right of fishing, and if the soil on both sides be owned by an individual he has the sole and exclusive right, but if there be different proprietors on each side, they own on their respective sides—"ad filum medii aquae"—subject, however, to the restrictions of law. It is impossible, within the limits of a newspaper article, to give a detailed account of the provisions which the legislatures of several States have introduced for the protection of game. It must suffice to say that from a very early period in the history of every civilized country statutes have been passed for the protection of game of all kinds, including the protection of the breeding of fish and preventing the destruction of the spawn or fry. A feeling of the interest which the whole community has in the development of the fisheries has led to the appointment of commissioners, and to a system of advancing public moneys to enable them to conduct and accomplish the good work in which they are engaged, and in the progress and accomplishment of it let every good citizen give a helping hand. Let every proprietor of the soil, every riparian owner, every sportsman, and every law-abiding citizen raise his voice, however weak, and exert his influence, however feeble, for the protection and preservation of game. The law is humane; it is a law of necessity, of public policy; it infringes no vested private right; it shields and protects "fur, fin, and feather" from destruction, and protects game during seasons of incubation and producing; it only directs its shafts against the unprincipled, disloyal, thievish poacher; it has stood the test of an English and American judiciary, and every man should support, sustain, and obey it. B.

THE NEW YORK STATE SPORTSMEN'S ASSOCIATION.—The Annual Meeting of this Association will be held in Oswego on or about the first week in June under the auspices of the Leatherstocking Club of Oswego County. An advertisement in this week's issue of FOREST AND STREAM contains the full programme of the exercises, which we should otherwise note editorially. The Leatherstocking Club has made full arrangements, not only for the convention, but for a most active season. At a meeting held last week the following letter from Mr. Bergh was read, in which the assurance was conveyed that the pigeon shooting matches at the convention will not be interfered with:

NEW YORK, April 27, 1874.

DEAR SIR:—

In reply to your telegram of yesterday, asking whether I intended interfering with the proposed "pigeon shooting" at the Sportsmen's Convention, to be held at Oswego, I have to say that I have learned that the Sportsmen's Club is a regular corporation, created by the laws of the State, for the express and avowed purpose of protecting and preserving game.

Furthermore, that on the occasion of its meetings the birds used are wild pigeons, untampered with, and in a state of nature; that also, outside marksmen are stationed by the Club where they can prevent the escape of mutilated birds, and finally, that the birds thus killed are used for "human food."

Now I see no legal parallel between that state of things and the shooting of tame pigeons, after the manner of certain individuals, in many parts of the State.

While, therefore, I regard the killing of these inoffending creatures under both circumstances as immoral, I do not purpose interfering with the Sportsmen's Club. I have the honor to be,

Your most obedient servant,

HENRY BERGH, Pres't.

We are pleased to acknowledge the courtesy of the Leatherstocking Club in receiving as its guest Mr. Wm. N. Griffith, the travelling representative of the FOREST AND STREAM, who was called to the floor at its last meeting, and very properly tendered the aid of the paper he represented in furthering the interests of the convention.

In this connection we take an opportunity to thank the editors of the Albany Journal, Syracuse Courier, Oswego Palladium, Utica Herald, Poughkeepsie Press, and others of the fraternity, not only for courtesies, but material aid and comfort extended to Mr. Griffith. His efforts through these and club members have been attended with marked success.

FORMOSA.—In a series of most interesting articles on Formosa, written for the FOREST AND STREAM by Piseco, the name of General Legendre, the pacifier of the Island of Formosa, was brought into notice. By the last accounts from Japan it seems that a Japanese fleet was ready to

start for the island, and we take the following from the despatches:

"Lieut. Cassell, late commanding the Ashuelot, and Lieut. Wasson, until recently engaged in the Yozo colonization department, are the naval and military advisers. Over political and general details Gen. Legendre, formerly United States Consul at Amoy, exercises supervision. The plan will occupy a long time in carrying out, and the Japanese do not expect to firmly establish themselves before the end of this year. The first detachment of the expedition will start on the 9th or 10th inst. The commander-in-chief will be Saigo Kiteosuke."

By the way, Mr. Bret Harte tells an admirable story of a Mexican officer who saved his life from the fact of his having a glass eye, which, while he sleeps, glares wide open on his murderer and so frightens off an assassin. It may be remembered that Piseco states that Gen. Legendre owed much of his influence over the people of Formosa from the fact of his having a glass eye, which he took out and put back again whenever he wanted to be particularly impressive. Gen. Legendre may then, to some, have seemed to be an apocryphal character, but all Piseco has said about Formosa and the General may be implicitly relied upon. So we see sometimes that truth is stranger than fiction.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

HIGH WATER, FOR THE WEEK.

—Mr. Daniel Edgar's large center-board sloop was recently launched from the yard of her builder, Mr. David Kirby, of Rye, Westchester County. She measures, by carpenter's rule, about 85 tons and is of the following dimensions:—Length over all 66 ft. 8 inches, length on water line 61 ft. 3 inches, beam 20 ft. 3 inches, depth of hold 6 ft. 8 inches, length of mast 77 ft., length of boom 63 ft., topmast 28 ft., gaff 33 ft., bowsprit outboard 31 ft. Her frame is of oak and chestnut and planking of yellow pine, except the garboard and upper strakes, which are of oak. Hatch coamings, sky-lights, and companion way, are of black walnut. Her cabin arrangements are well designed and will be neatly finished with pine panels edged in black walnut. We have not heard by what name she was christened. Mr. Kirby has been an unusually successful builder of our open racing sail boats like the "Meteor," "Lee" and "Maud," the latter, by the way, was one of his own boats. The "Addie," also built by Mr. Kirby, of the large class, was quite successful until eclipsed by the "Gracie," so the "Vision" will have to look to her laurels this season, for practically she will have two new antagonists in Mr. Edgar's new sloop and the "Gracie" so changed that her past record belongs only to her old self.

—The Brooklyn Yacht Club held its regular monthly meeting on the 29th of April at the new rooms of the club, corner of Montague and Court streets. The President, Mr. P. W. Ostrander, presided, and in calling the meeting to order congratulated the club on the acquisition of such comfortable quarters. The rooms are furnished handsomely and consist of a large audience room for club meetings, a smaller one adjoining for social gatherings, library, committee room, &c. After the general routine business Mr. Wm. F. Costen and Mr. Francis Burritt, owner of the new schooner yacht "Estelle," were elected members. Mr. Costen exhibited to the club a distinguishing night signal composed of various colored lights. On motion of Vice Commodore Dickerson, the signal was adopted. Mr. Costen said that the New York Yacht Club had gone to an expense of \$600 to perfect a code which should accompany the night signals so that yachts could have a complete method of communication by night, and that by resolution of that club members of either the Eastern or Brooklyn Yacht Clubs can be furnished with a copy of the code at merely the cost of printing by application to the Secretary of the New York Yacht Club.

—Mr. William Edgar Morris, who formerly owned the "Maud," is also having a sloop yacht built by Mr. Kirby, of Rye. She is to be called the "Wayward" and will probably be completed some time in June. Her dimensions are as follows:—Length on deck 48 ft. 2 in., beam 15 ft. 5 in., depth of hold 4 ft. 9 in., length on water line 43 ft., mast 54 ft., topmast 22 ft., boom 44 ft., gaff 23 ft. 6 in.

—Mr. Fowler has ordered from McGiehan, of Pamrapo, N. J., a center-board sloop which will probably be launched some time next month. She is to be 47 ft. over all, 39 ft. keel, 14 ft. 6 in. beam, and 4 ft. 11 in. deep. If intended for a racer, she will be apt to fulfil all expectations, for Mr. McGiehan has built some very fast vessels.

—The sloop yacht "Anna," Mr. Cumming, of the Atlantic Yacht Club, is in the hands of Kirby, of Rye, undergoing extensive alterations. Her top sides will be raised about 10 inches with a view to improving her heavy weather qualities.

—The boating season in Boston was inaugurated last Friday evening by two races, one for single sculls and the other for four-oared, both rowed in the harbor off Commercial wharf. The races were closely contested and afforded much gratification to the crowd which had assembled on the ends of the docks, in the rigging of the

shipping and in small boats near the start. The single scull race was pulled first and the boats started about six o'clock. The contestants were the well-known North End oarsmen J. N. Henry, J. J. Flynn and P. McGonnigle. The race was well contested, being two miles, turning a harbor buoy, and made in 15 minutes 3 seconds by Henry. McGonnigle was second, and Flynn a good third. A gold medal was the award of the Associates to the winner, and a silver one was taken by McGonnigle. Only three of the four boats entered completed the course in the four oared race. The order of their coming in was as follows:—

"Young America"—J. N. Henry, M. McDevitt, P. Duffee, Wm. Hennessey.

"Bonnie Blue"—E. McCarthy, J. Nagle, J. Gallagher, P. Campbell.

"Greenback"—J. J. Flynn, D. McGonnigle, M. Connors, J. McGravey.

The "Young Americas" pulled the race in 17½ minutes, the "Bonnie Blues" were in in 19 minutes and the "Greenbacks" one minute later. The Judges were M. Burns and J. Gallagher and the Referee was M. Driscoll. The prizes were awarded to the first and second named crews. This is the only annual regatta of the Associates, but "scrubs" are in order for the remainder of the season.

—To those of our aquatic readers who like to go dead to windward without tacking, we would recommend a visit to the office of the New York Safety Steam Power Company, who are paying particular attention to the construction of steam launches and will furnish them complete in every way, fitted and furnished with a view to the purpose for which they are intended.

—Messrs. Harvey and Pryer, the well known yacht builders at Wivenhoe, England, have invented a new sail called the shadow, which it is supposed will supplant the spinnaker. This sail might be used by our yachtsmen to advantage in cruising, but as it partakes of the character of a square sail it would be generally ruled out in regattas. The following is a description taken from the London Field:—

"The gaff is socketed to the masthead under the forestay, and as it has a universal joint, it will not require unshipping to be shifted from side to side. Several hoops will be seized to the head of the sail, and when the latter has to be hoisted the hoops will be passed over the gaff, and then the halliards (rove through a single block) will be hooked to the gaff. The sail will be kept in to the mast whilst it is being hoisted, and the tack will be hauled out to the boom end—the boom, by the way, is rigged as a spinnaker boom—and the sail sheeted. To keep the gaff from going forward a brace or vang will lead aft from the gaff end. The sail will contain more canvas than would a spinnaker of the same length in the foot. But beyond this it is intended in long runs in light winds to set a jib-headed top-sail above the gaff, so that an area of sail will be got equal to that of mainsail and topsail. There is no doubt that this will be a most effective sail when once set, and that there will be no strain on the top-mast."

BOSTON YACHT CLUB.—This flourishing organization held their annual meeting of 1874 at the rooms of its Treasurer, Augustus Russ, Esq., 15 Pemberton square, Boston, on Wednesday evening last, April 29th; Commodore Benjamin Dean, presided. The committee appointed at the previous meeting to confer with Dorchester Yacht Club, and arrange for the regatta in which this club had been invited to participate to take place on the 21st instant, reported progress, and that they awaited further action of the Dorchester Club in the matter of change of certain rules, so that the regulations of the two clubs regarding regattas should not conflict. Mr. Russ, the Treasurer, submitted his annual report, from which it appeared that \$9,665 had been raised and disbursed during the year, and that the permanent fund invested in the club house and improvements, exclusive of, and above a mortgage of \$5,000, amounted to about \$4,800. Nearly \$9,800 has been expended, and about \$1,000 more, which has been pledged by ten life-members, it is expected will be required to fully complete the structure and its appurtenances. The whole number of members is now 263. Deducting the life and honorary members, who are exempt from assessments, the income of the club from its annual assessments will exceed \$20,000 per annum, and from rent of wharf and lockers \$1,000 more. In consequence of the superior accommodations and attractions furnished to yachtsmen, the accessions of new members for the past few months number from twenty to thirty per month. The Commodore's report cited the above facts and congratulated the club on the prosperous condition. The annual election resulted in the choice of the following board of officers, which is with some slight variations the same as the past year:—Commodore, Benj. Dean; Vice Commodore, W. H. L. Smith; Rear Commodore, George B. Durfee; Secretary and Clerk, Thomas Dean; Measurer, D. J. Lawler; Trustees, S. D. Nickerson, J. Claxton Cary, Arthur Cheney; Regatta Committee, Charles E. Russ, Coolidge Barnard, W. F. Halsall, S. L. French; Membership Committee, A. C. Martin, C. E. Russ, Paul West; House Committee, Commodore Dean, D. B. Curtis, S. D. Nickerson. An attempt to amend Rule IV of the sailing regulations, which reads, "the third class shall comprise all yachts measuring eighteen feet, and under twenty-six feet," so as to allow the enrollment of yachts of sixteen feet, proved futile. The thanks of the club were tendered to FOREST AND STREAM for favors. Over thirty yachts were represented at the meeting.

—The Atalanta Boat Club have nearly finished the second story of their boat house. It is reported that Mr. Withers will not pull stroke this year in the club four.

—The Neptune Boat Club House, at Factoryville, Staten Island, which, it will be recollected, was destroyed by fire recently, has been commenced. The house will be the finest one of the kind in the country, and will cost when completed, exclusive of furniture, about \$10,000.

BOSTON BOAT CLUBS.

THE following list of clubs and officers will show how much interest that city takes in rowing and that there is material sufficient to retain laurels won, perhaps to achieve many more victories:—

THE UNION BOAT CLUB,
organized May 26th, 1851, is, with the exception of the Atlanta Boat Club of New York, the oldest and largest boating association in the United States, the number of active members being one hundred and thirty-one, and thirty-two honorary. Its officers are—President, Henry B. Rice; Vice-President, Edward N. Fenno; Secretary, Edward B. Robins; Treasurer, William M. Rice; Captain, Robert S. Russell; Lieutenant, Charles H. Williams; Directors, Albert G. Baxter, Daniel Sargent and George Roberts.

THE WEST END BOAT CLUB
has in addition to its floating boat houses at Craigie's Bridge, club rooms at the corner of Livingston and Charles streets, furnished in the most elaborate manner. This club numbers one hundred and thirty-three members, of which fifteen only are honorary, and has about sixty boats of all descriptions. It was organized in 1866 and is officered as follows:—President, J. J. McCarthy; Vice-President, C. V. Buntin; Secretary, E. J. De Coursey; Treasurer, John C. Smith; Captain, Thomas C. Butler; Lieutenants, J. H. Butler, and Frank Hosmer.

THE SHAWMUT BOAT CLUB,
founded January 30th, 1870, has on list twenty-five active and fifty honorary members, and is the possessor of nine club boats, besides giving room in its boat house at Dover Street Bridge to a number of private boats. At a recent meeting, the following officers were elected:—Captain, John F. Murphy; President, John M. Flynn; Secretary, Thomas J. Lynch; Treasurer, Thomas J. Flynn; Directors, E. J. Noonan, James Sullivan and M. Mahony.

THE BOSTON BOAT CLUB,
organized in January of the present year, have as yet no boat house, but will erect one at Cambridge Bridge as soon as permission is granted. They have six boats, all new and of various descriptions. They propose to send representatives to Saratoga, Philadelphia and Troy. The following is a list of the officers:—President, John Doherty; Secretary, P. Regan; Treasurer, James Fitzgerald; Captain, George Faulkner; Directors, C. V. Buntin, Andrew Connor, and James W. Frazer.

THE HOWARD ASSOCIATES,
founded in January, 1868, as an Athletic Club and numbering thirty members, have done creditable work with the oar. They own no boats but hire them as required. The officers are:—President, P. Carlton; Vice-President, Daniel Davidson; Secretary, J. J. English; Treasurer, P. Gill; Directors, Edward F. McAvoy, G. McLean, T. McCarty.

THE LAFAYETTE BOAT CLUB,
strictly speaking, is social and athletic, organized in the summer of 1870. They bear the name boat club, however, and each year have a regatta.

THE CITY POINT ROWING ASSOCIATION,
organized in January last, has on its roll twenty active members and has elected the following officers:—President, F. F. Bibber; Vice-President, Edgar Eveling; Secretary, E. T. Atwood; Treasurer, F. F. Bibber; Captain, T. J. Higgins; Lieutenant, T. Scanlon. Arrangements are being made for the erection of a suitable house near the foot of Sixth street.

THE STAR LIGHT BOAT CLUB
has its rooms in the Dorchester district. The club was formed in 1873 and its present officers are:—President, J. McIntire; Vice-President, W. Hennessy; Secretary, J. Howard; Treasurer, F. Lennon; Captain, J. Rockwood; Directors, C. Rockwood, M. Mahan, T. Shean, E. Devine.

THE JAMAICA BOAT CLUB
dates from August 2, 1869, and numbers forty-five active members. In the boat house, which is at the foot of Pond street, on the west side of Jamaica Pond, are nearly twenty boats. The officers are:—President, A. G. Gorham; Secretary, E. L. Lincoln; Treasurer, F. B. Reynolds; Directors, Joseph Curtis, W. P. A. Brewer, H. G. Balch.

THE ELIOT BOAT CLUB,
organized last August, is located next door to the Jamaicas, and will take part in their regatta. This Club has a good boat house and numbers ten active members. The following officers have been elected:—President, J. W. Mackintosh; Secretary, H. D. Kious; Treasurer, G. C. Hagar; Captain, H. Wainwright.

THE HARVARD UNIVERSITY BOAT CLUB,
of Cambridge, is the first on the list, and has probably done more than any other to build and keep up the interest in amateur rowing, not only in the neighborhood of Boston, but throughout the entire country. The record of this club is so well known that it would be useless to reprint it here. As early as 1855 class clubs were in vogue at Harvard, but it was not until 1869 that the present organization was effected. In the boat house of this club are between fifty and sixty boats all in good condition and on the books are the names of one hundred and ninety-six members. The following is a list of the officers:—President, Wendell Goodwin; Vice-President, Frank S. Watson; Secretary, Walter J. Otis; Treasurer, George F. Roberts; Assistant Treasurer, Henry S. Van Duzer; Captain of the university crew, Wendell Goodwin.

THE CRYSTAL LAKE BOAT CLUB,
of Melrose, was formed February 5, 1872, by the consolidation of the Ripple and Enid boat clubs. The number of members is forty-three, five of whom are honorary. The

club purpose erecting a suitable boat house on a tract of land bordering on Crystal Lake. The officers are as follows:—President, Hobart Clark; Vice-President, George E. Munroe; Secretary, George M. Ray; Treasurer, Charles B. Hill; Commodore, Sidney H. Buttrick; Vice-Commodore, William D. Serrat; Directors, Charles C. Barry, William R. Lavender, Charles B. Hill; Trustees, Charles C. Barry, J. Warren Sanders, Walter I. Nickerson.

THE THETIS BOAT CLUB,
of Medford, was organized March 1, 1870, and has twenty-one active and nine honorary members. Their boat house, on the Mystic River, is a handsome building containing, in addition to their thirteen boats, billiard tables for the use of the members. The following is a list of officers:—President Warren J. Manning; Vice-President, George M. Coburn; Secretary, Samuel Lapham, Jr.; Treasurer, Geo. F. Manning; Directors, Edmund Bridge, F. A. Morse, Henry Bradlee.

THE WINNISIMMET BOAT CLUB,
of Chelsea, was founded in 1863 and re-organized March 31, 1866. There are forty-six members at present. The club boat house contains twenty-nine boats of all kinds. The officers are:—President, E. S. Harris; Secretary, W. R. Baynal, Jr.; Treasurer, E. A. Fellows; Captain, F. W. Snow; Lieutenant, Geo. Ballsdon, Jr.

THE BROOKLINE ROWING CLUB,
dates from April 6, 1870, and has a membership of fifty. The boat house is a floating one and contains twenty boats exclusive of two Rob Roy canoes. This club has for its officers:—President, Henry M. Martin; Secretary and Treasurer, Frank Dupee; Directors, S. P. Train, W. S. Cutler, S. G. Train; Regatta Committee, Frank Dupee, S. P. Train, E. P. Kennard.

THE DON QUIXOTE BOAT CLUB,
of East Somerville, was organized in the spring of 1872, and numbers twenty-one active members. They merely row for pleasure and take no part in any of the racing. The officers are:—President, Thomas I. Delano, Jr.; Secretary, Fred. G. Tuttle; Treasurer, A. A. Smith; Captain, H. A. Cole.

For Forest and Stream.
CANOE CRUISING.
NUMBER TWO.

THE canoe "Passenger Bird," a drawing of which accompanies this article, was built for me in 1871 by Mr. William Biffen, of Hammersmith, who has invented a portable boat from which the design of the canoe is partly taken. She resembles the Ringleader type of canoe, with greater beam and not quite so much depth; her model is a good one, and she has proved a good sea boat in rough waters. She is remarkably stiff, and we can fish or shoot from her without any danger of an upset. Her peculiarity is that she can be separated into three pieces, the stem and stern sections being fitted to the centre compartment by screws, one at each gunwale and one over the keelson; the stern can be unscrewed and the two ends packed into the cockpit as shown in the drawing. By this means the length of the boat can be reduced from seventeen feet six inches to ten feet, which makes her more convenient for carriage by rail or wagon, and diminishes the danger of her being strained or broken. There is no danger of the boat leaking at the joints when she is properly built. The "Passenger Bird" has travelled some thousands of miles by steamship and rail, has been taken to pieces and put together a great many times, and there are no signs of the joints becoming loose or shaky now.

A shorter canoe might be built on the same principle which would pack into a smaller compass, and could be transported as easily as an ordinary box.

She is built of Spanish cedar with oak garboards, and now weighs, without gear, about one hundred pounds, having gained considerable in weight since she was built, as most wooden boats will do; nevertheless by the help of a strap passed through the copper ear shown on each side of gunwale amidships, I can portage her after the Indian fashion of carrying a birch bark canoe without much difficulty for some distance. Her chief defect is that she is too heavy, I think unnecessarily so, and that a canoe of her dimensions could be built on the same principle that would not weigh more than eighty pounds without gear, after use. She would also be improved by having more "camber" and a rounder deck. The stem and stern compartments are, of course, quite water tight, as bulkheads are fitted between the joints. She is rigged with a lateen sail for running before the wind chiefly; this is too much for her except in strong breezes.

To capitulate then: The sort of canoe I would recommend for cruising purposes is the "Ringleader" type, and would be one of the following description: The dimensions are given approximately to suit a man up to about one hundred and eighty pounds in weight, and to carry besides about forty or fifty pounds of "gear" (provisions, light tent d'abri, clothes, etc.) Length, seventeen feet; width, twenty-six or twenty-eight inches; depth, from keelson to line drawn between the gunwales amidships, ten inches, rising at stem and stern so as to give about three inches sheer. She should have about one and one-fourth inches "camber," by this term I mean the rise of the keel fore and aft above a level line (I believe this is the usual definition of the term "camber" amongst boat builders). The model is an important consideration, and a great deal must be left to the builder as a general rule; fine entrance, flat floor, full after body, good shoulders, the top sides tumbling home a little. The deck ought to be well rounded, cover-

ing in the whole boat, with the exception of the cockpit where the paddler sits, which is provided with a movable hatch. She should have an inch of keel, and light bilge pieces will, I think, be found an improvement. The greatest beam should be at or a little abaft the midship section, and water-tight compartments may be placed at each end. The arrangement of the cockpit should be as simple as possible. That of the "Nautilus" shown in FOREST AND STREAM of March 26th is a very good one. The plan of a water-proof apron adopted by "Rob Roy" has its drawbacks, the chief of which are that the legs and knees of the canoeist are generally damp, and it is not stiff enough to keep out a sea breaking over the boat. I beg to submit a design for a hatch which I think would be found a good one. The cockpit to be of an elongated oval shape, length about three feet eight inches, width sixteen or eighteen inches, coaming about three-fourths of an inch above the level of the deck, the fore part of the cockpit to be decked over for eight inches, where the stretcher and the paddler's feet are, the after part decked over for about a foot, where the locker for provisions may be placed, between these the movable hatch, two feet long, with a broad band of india rubber passing from one side to the other round the fore part of the coaming to keep it in its place; the hatch could thus easily be shipped forward, and would not hamper the canoeist in the event of an upset.

A light lateen sail as shown in the drawing of the "Passenger Bird" will be found a good, handy sail for running or reaching; a standing lug is also a good sail for a canoe, and might be preferred to the other.

The paddle should be about eight feet in length with oval blades for cruising. If desired the paddle can be made in two pieces, joined by a copper ferule, so that one blade can be set at right angles to the other, producing a "feathering paddle."

The material of which the canoe is to be built may be of some light wood, as described in FOREST AND STREAM for March 19th.

A canoe of the above description ought not to weigh more than eighty-five pounds with sail and paddle. She should be well varnished inside and out with shellac and copal varnish.

Since I have been at Halifax I have read a description of the "paper boats" built by Messrs. Walters and Balch, of Troy, New York, which has so strongly impressed me with their advantages that were I ordering another canoe I should get one built of paper by Messrs. Walters and Co. and give it a fair trial. I speak with great deference on the subject however, as I have never seen one of these boats. If they are at all like the description given of them they possess many advantages over wooden ones—strength, lightness, capability of being easily repaired, all of which are important considerations in the construction of a canoe.

"Passenger Bird" with hatch on and sail set.

1. Cover of locker.
2. Stern extremity.
3. Bow extremity.
- 4, 5, 7, 8, Opening in deck where screws are arranged.
6. Tube for mast.

In this cut the canoe "Passenger Bird" is shown taken to pieces and arranged for packing. The hatch is left off that the manner in which the end compartments are stowed may be seen.

As all the measurements have been given, the scale in the case of drawing No. 2 has been enlarged for the purpose of showing more detail.

C. M. D.

HALIFAX, Nova Scotia, April, 1874.

THE CANOE QUESTION.

New York, April 28, 1874.

EDITOR FOREST AND STREAM:—

C. M. D., in your issue of March 23, takes exception to the Nautilus type of canoe. First, because they are too heavy, and secondly, because they draw too much water. Weight is certainly a most important consideration, but I think he must be misinformed in this respect, or else have seen only exceptionally heavy canoes. In the New York Canoe Club are several Baden-Powell canoes of the ordinary size; length, 14 ft.; beam, 28 in., which on leaving their builder's hand weighed, including flooring boards, bulkhead, hatches, rudder and paddle, only 56 pounds. Personally I think this is too light, for I do not believe, when so constructed, that they will take the strain of sleeping in them without leaking eventually. My own canoe weighs in the neighborhood of seventy pounds, and has been perfectly satisfactory as a canoe, paddling easily, and sailing remarkably fast. Nor have I found the gear necessarily attaching to the three sails half so cumbersome as I should imagine the want of it would have been when blessed with fair and leading winds. If C. M. D. desires to explore many narrow and shoal creeks, and make frequent portages, no doubt a better boat might be found than the Nautilus type; but for ordinary cruising in lakes, rivers and canals, I like them very much indeed. As to draft of water, the Nautilus canoe does not, as a rule, draw more water than the Rob Boys. I have seen (one of

Searl's and several others, all English)—for although they have generally an inch more keel than the Rob Roy—their greater displacement prevents the body of the boat going quite so deep. That they are better sailing canoes than the Rob Roys is, in my opinion, not owing to weatherly qualities from greater draft of water, but from a greater sail-carrying power. The Nautilus canoe with owner, stores and all essentials rarely draws over six inches. K. NEWMAN.

WASHINGTON, D. C., April 12, 1874.

EDITOR FOREST AND STREAM:—

Invention seems to have reached its limits in life-saving apparatus, or nearly so. Holmes' life-boat will live at sea when anything will, but there are times when no boat can be forced over the breakers against a severe gale. The heavy English life-boats will not do for our shelving coast and even they sometimes founder. Ships occasionally strand beyond the range of a mortar, and then the life car is useless. In fact, there occasionally comes a time when no boat can go to sea and no line can be thrown to a wreck, and the result is death to all on board. The reasons—the breakers and the wind. The line of breakers extends sometimes half a mile seaward, and it is impossible to force a way across them from the fact that the top coils over the base and opposes a perpendicular wall which the boat cannot mount and which also fills her or upsets her. The wind alone (save in a cyclone) would not oppose the progress of a boat properly constructed and manned; but the wind and the breakers occasionally do. Therefore, since we cannot construct better boats nor get better crews, it would seem that we should begin at the other end of the skein to unravel the thread. To pour oil upon the troubled waters is a mandate as old as the Scriptures. Every sailor knows that pouring oil upon the water prevents it from capping. Now, if breakers could in this way be converted into rollers, would not the difficulty be partially overcome? A boat could easily go over a smooth roller that would swamp among the breakers, and there are many ways in which a large area of water could be oiled. For instance, let shells filled with oil, so constructed as to burst after a given interval of time, be fired from a mortar. A small quantity of oil will spread over a vast surface. Or, if the ship be within reach of the mortar, let a suitably prepared vessel filled with oil be attached to the shore end of the line, and when the crew of the vessel would haul in the line the way would be oiled for the passage of the life-boat. In fact, the main idea is to oil the water. Any ingenious person could arrange the details. It is a plan which can easily be tested by a life-boat's crew in fair weather, and should it prove moderately successful only, it will be of some benefit. Now let ye yachtsmen speak words of wisdom. Yours truly, D. T. TOWNSEND.

BOND'S IMPROVED SECTION BOATS.—There is now on exhibition at the office of the FOREST AND STREAM one of Mr. Bond's Sectional Boats which has attracted a great deal of attention. The sides are made of the best galvanized iron, securely joined to a wooden bottom. The boat is divided into two sections, with an air-tight compartment, and one portion of the boat fits securely in the other, offering great advantages for transportation. With a whole weight of from sixty-five to ninety-five pounds, on a portage, a party of two or four could easily carry the boat when divided into its two parts. All sizes are made, from twelve feet long to sixteen feet; the twelve feet boats carrying two persons, the sixteen feet four. Various models are made by Mr. Bond, either for fresh or salt water, as they may be required by the sportsman, the trapper, or the explorer. It may be, perhaps, very desirable to have a light boat, but there is no doubt but that lightness is very often obtained at the sacrifice of durability. It should be recollected, too, that the life of a boat is not always a purely aquatic one, but rather of an amphibious character. Who has not in hunting, or when voyaging, remembered the staunch, tidy boat that took not in one drop of water at first, but when she laid in the hot sun a day or so, or got bumped and banged on rocks, and then had to be hauled over a marsh or so, or through a sedge shallow place, just deep enough to float her, how she gapped after a while at every seam and let in water faster than it could be bailed out. The models Mr. Bond has adopted are pretty to a degree, and there is no doubt but that his neat little crafts are both speedy, comfortable, durable, and above all, safe. Mr. Bond makes canoes on the same principle with centre boards, and states to us that in the West the canoeists prefer them as to ease of working, speed and safety to any others. We have no hesitation then in recommending Mr. Bond's sectional boats, believing that they will supply a want either for purposes of pleasure or for exploration. Complete in every way, they are quite reasonable in price, and we do not see why Mr. W. E. Bond's boats, made in Cleveland, Ohio, should not be used quite as much in the East as they are in the West.

—The New York Athletic Club rowing men are practicing daily on the Harlem River. Al. Curtis will pull stroke in the four, with Rathborne bow, and H. C. West and Charles Cone in the waist. They will be about the lightest crew on the river, not averaging more than 150 pounds. Mr. Rathborne of this club has been successful in the two last contests for the monthly single scull subscription medal; if he wins on Saturday next the medal becomes his property.

—The Harlem Rowing Club and the Nassau Boat Club have arranged a race to be rowed on the Harlem River, Monday May 11th, for the championship of the river and a set of colors. This will be the first boat race of the season in this vicinity.

—The Buffalo Rowing Club have agreed to row a three-mile race in four oared shells with the Argonauta Rowing Association, of Bergen Point, N. J. The race is to take place on the Kill Von Kull, June the 10th. The Argonautas are the champions of the Kills.

—The Atalanta Club has received three challenges for the coming season. The first is from the Yale University Boat Club, to row a three-mile race in six-oared shells, in June, on Lake Saltonstall. The second is from the Baltimore Rowing Club, to row a four-oared race on the Harlem River, and the other is from the Argonautas.

—The Regatta of the Harlem Rowing Association is fixed for June 8. A liberal programme will be offered, including a four-oar, pair-oar, and single scull races.

—Ellis Ward of New York challenges William Scharff to row a five-mile race for \$1,000 a side.

Sea and River Fishing.

FISH IN SEASON IN MAY.

Salmon, *Salmo Salar*. Salmon trout, *Salmo confinis*.
Trout, *Salmo fontinalis*. Shad, *Alosa*.
Land-locked Salmon, *Salmo gloveri*. Michigan Grayling, *Thymallus tricolor*.
Black Bass, *gristes salmoides*, *gristes nigricans*.
The amended fish law of New Jersey prohibits the taking of black bass within the State before the 1st of June.

—The first mackerel of the season were sold on Tuesday last in Fulton market. They were caught some 100 miles south of Sandy Hook. They generally make their appearance about the first or second of May. Fishermen say this first catch of mackerel is finer and larger than has been seen for many years. If it were possible to use quicksilver and mother-of-pearl as pigments, an artist might paint their beautiful colors.

THE ART OF FLY MAKING—Second Cast.—Let me imagine, my reader, that you have taken a seat by my side at the table where I tie my flies. Before us are two paper boxes, each about sixteen inches long, four deep, and five wide. On removing the top the sides towards us fall by little muslin hinges, on the table. The boxes are divided by little pasteboard uprights, each into five apartments of equal width. In the first apartment of the box on our left are bits of feather used for the tails of flies, viz., the tail coverts of mallard, teal, sheldrake, and woodduck; feathers from the crest, ruff, back, and breast of the golden pheasant; red ibis, parrot, maccaw, and a few dyed feathers. The second, third, and fourth apartments are for the feathers for wings, described in my first cast, and the fifth contains my hackles. These feathers are neatly folded in slips of paper, and placed in large sized envelopes, which have the names written at the top of the back. They set edgewise in the box, with the inscriptions all facing the same way, so that by passing my fingers over them I can easily find the feathers I am about to use. The box

to my right contains, each in its proper apartment, hooks in little boxes, the size marked on top and bottom, hand vise, spring pliers, picker, wax, a pair of sharp scissors, three and a quarter inches long, with blades an inch long and one quarter inch wide, a small flat piece of India rubber for straightening gut, wrapping silk of various colors and degrees of fineness, floss silk, peacock and ostrich hurl, and the different kinds of dubbing as enumerated in my last paper. I do not imply by the foregoing that so methodical an arrangement is necessary for an amateur, but something of the kind would prevent confusion.

Suppose, first, we tie the simplest hackle, say a ginger on a No. 6 hook. If you use the vise, fasten the hook between the jaws, then take a piece of wrapping silk of the required length, say a foot or fourteen inches, and rolling a mite of wax as large as a BB shot between forefinger and thumb, draw the silk through twice. With the hook in the position shown on the annexed illustration, whether held by vise or between the thumb and forefinger of the left hand, take five or six turns around the shank of the hook, as shown in figure 1. Then, laying on the gut, commence quite close to the head and wrap down to A, figure 2. Here, with three turns of your wrapping silk, fasten in the floss, A B, and laying the wrapping silk along the shank, tuck it in between the gut and the head of the hook, and throw a few loose coils around the gut to keep it out of the way. Now wind on your floss as far as C, figure 3, increasing the bulk of the body somewhat as you proceed; then throw the loose coils of wrapping silk free from the gut, and take three turns over the floss and clip off the end. You next take your ginger hackle, about the length figured, and stroking back a few fibres at the point and clipping off the end, lay it against the hook and fasten in with four or five turns and wrapping up to within a sixteenth of an inch or so of the head, throw a few loose coils around the gut as before. Now wrap on your hackle closely, pressing back the fibres as you go to avoid over, lapping them. On getting as near the head of the hook as shown in the illustration, fasten the hackle with two or three turns, clip off the ends and throwing the wrapping into coil D F D, seize it at F and take as many turns as will come to the very end of the shank. Now reversing the turns, with the gut through the coil, you draw on the end D until the wrapping forming the coil is drawn tight. Your fly now after clipping off the surplus wrapping is complete, needing only a touch of copal varnish, with a small camels hair brush at the head to make it secure.

"Let me tell you, scholar," as Father Isaac so frequently remarked to his pupil Venator, the tying of this simple hackle is the all-important rudiment of the art. If you learn to make it neatly all else will become "just as natural

as falling off a log." But let us tie another hackle and beautify the lower part of the body with a little tinsel. So we go back to figure 2 and suppose A B a strip of flat gold tinsel which we have fastened in with three turns of the wrapping and thrown the latter in a few loose coils around the gut. We take three turns of the tinsel, perhaps four, or even five if the hook is large, down the shank closely, so as to hide the hook, and then as many turns back, and after fastening with two or three turns of the wrapping cut off the end of the tinsel. We will vary the body of this hackle by having it of peacock's hurl. We accordingly take four or five hurls between the thumb and finger of the left hand and clipping them off evenly, lay them on where you have just clipped off the tinsel, and take two or three turns over the ends which project toward the head of the hook. Now laying your wrapping silk slightly, winding in the meanwhile as far up the shank of the hook as you intend the body to extend, then fastening in your hackle you proceed as already described.

Fur, mohair, pig's wool and seal's wool are spun on in the same way. A ravelling of any fabric, for instance moorhen, may be fastened and wound on as floss silk. In making a very large body to a fly it is a matter of economy when using floss silk, to wrap first with daring cotton, or similar material. It matters but little as to the color, as the floss covers it.

To make a palmer hackle proceed as instructed as far as A figure 2; and after putting on the tinsel, if it is required, fasten in the tip end of the hackle, then the material of which the body is composed. Now you have tinsel, hackle, and dubbing tied in, and the rule is that the material fastened in last is wound on first, so you wind on your dubbing, fasten it a little below the head of the hook, and then taking three, four or five turns of the tinsel in the same direction you fasten it also. Now you wind on your hackle just behind and close to the tinsel, and as you get near the head of the hook disregard the tinsel and take a few close turns of the hackle, fastening it, clipping it off and finishing as already directed. In a palmer the fibres of the hackle should stand out much thicker at the shoulders and head of the fly than along the body.

I hope the reader, who has patience enough to read and experiment a little, will understand the directions I have given for tying hackles and palmers, for they are pertinent, as far as they go, to making winged flies, which I will treat of in my next lesson or "cast," as our editor suggests I should call it. Those who are interested in the matter will, of course, keep the back numbers of FOREST AND STREAM, as I shall likely have occasion to refer to the illustrations again.

The most celebrated fly makers use only their fingers, but a small hand, or as some call it a pin vise, is exceedingly convenient when one wishes to lay down his work for a while. By twirling it with the left hand and holding the material with the right you can wind on the most delicate floss without soiling it with wax, which it is almost impossible to have your fingers entirely free from. In fact it is necessary sometimes to dissolve whatever of it adheres to the fingers with a little oil and then wash your hands with soap and water to get rid of the oil.

THADDEUS NORRIS.

—The Greenport Watchman gives us some idea of what the trout fishing on Long Island used to be forty years ago. It says that "in the spring of 1834 Thomas Floyd Jones and Dr. Kortright, of South Oyster Bay, visited Yaphank for a day's trout fishing, and in a few hours took from the mill pond seventeen trout, weighing thirty-four pounds, fifteen of which weighed thirty-two pounds! These were not nursery trout, but magnificent and untamed natives of the brook. The Yaphank mill pond was then noted for the great size of its trout—individuals of which, weighing two pounds and over, being common. A few years subsequent to the above date, the late Henry Osborn of Bellport, and Mr. Cox of New York, caught in the same pond after about an hour's fishing, seven trout weighing ten pounds, one of which weighed nearly three pounds. The opportunity of such fishing here will probably never recur. The race of trout in the mill pond here is nearly or quite extinct."

—Anglers in the Umbagog district who have been entertained in past seasons by mine host, E. W. Gregg, at Andover, Maine, will be pained to hear of his death, which took place some weeks ago. His house will, however, be carried on this summer by Charles Cushman, his nephew, better known perhaps, as one of the best guides in Andover.

—W. C. Egan, Esq., of Chicago, tells us of a monster mascalonge that was taken at Alexandria Bay, August 15th 1872, by Geo. H. Marvin, of Brooklyn, with an eight ounce fly rod and No. 7 Limerick hood. It weighed thirty-two pounds and measured four feet and one inch in length. A full account of his capture was printed in the Brooklyn Eagle at the time. After playing the fish a couple of hours without much diminishing his vigor, he was brought to gaff by shooting him through the head. There were two others in the party besides those mentioned that witnessed the capture, which was certainly a most remarkable feat. They were A. E. Masters, of Brooklyn, and H. G. Van Wyck, of New York.

—The Murdock Lake Fishing Club have given up their former lake in Illinois, and under a charter from the State of Missouri have organized a new club, leasing for its use Kings Lake in Pike county, Missouri. The club house, a substantial and comfortable building will be finished by June. Kings Lake has an inflow and outflow from the Mississippi River, consequently is renovated every spring, with fresh fish and water.

—The question as to who discovered the first grayling in Michigan, who took the first with fly, and who identified the fish, is becoming somewhat complicated. We begin to think it time to call the "honors easy," and take the game as we find it. We append the following note from our regular correspondent: "As I supposed, my friend D. H. Fitzhugh, Jr., would disclaim being the first angler to bring

the Michigan grayling into notice as a sporting fish. Mr. John V. LeMoyné of Chicago, preceded him some two or three years in taking them with the fly. This was, "*Mirabile dictu*," in the river Jordan, (I always had faith as a Methodist that there *was* fishing in Jordan,) a stream connecting some small lakes east of Little Traverse, and accessible partly by small steam tugs towing rafts of lumber and then by canoes. With a seven ounce Norris rod Mr. LeMoyné killed them there "*ad nauseum*" about five years ago.

THAD'S NORRIS.

—Dr. T. J. Curle, of Walnut Hill, Kentucky, has kindly submitted for our examination a mechanical contrivance of his own, which he regards as an improvement upon any of the present modes of splicing or connecting the several parts of a fishing rod for use. It is a combination of a ferrule and hinge-joint. The joints very much resemble the joints of the old-fashioned sun-shades that ladies used to carry, sometimes before the face, sometimes over the head, and the joined parts of the rod are kept in place just as the parasol handle was, by a sliding ferrule, which can be passed over them. The principle advantages claimed for this invention are that it unites the parts firmly and prevents them ever being thrown apart while making a cast, inasmuch as the hinge joint holds them inseparable. Frankly, we have not been captivated by the invention. Mechanically, the uniform elasticity of the rod (in light rods) is totally destroyed, and its usefulness as a fly-rod made *nil*. As a "*pole*" it is an undoubted success. Our judgment may be at fault, but our criticism is honest.

—A member of the Scorpion Club, of Cedar Rapids, Iowa tells us there is good fishing there of all kinds, especially of black bass. He says:—

"Our fish in this season are black bass, (salmon I call them,) wall-eyed pike, pickerel, which they call pike, monster eat fish, channel, yellow, and white perch, and muscalonge; one caught on the 27th, weighed twenty-seven pounds, caught with a spoon hook. In the spring they go north, and when in the fall they go south, then is the fisherman's opportunity. One gentleman, President of the Scorpion Club, caught ninety-two pounds in two hours. Our bait is black suckers, and a minnow called a yellow fin, marked like a yellow perch, on the sides blue. They stay till about 10th to the 20th of July and then totally disappear. How bass will go for them in the spring! You can count minnows by the tens of thousands.

In the following letter our correspondent S. D. E. extols the attractions of the north shore of Lake Superior, which have received frequent mention in this journal. He says truly:—

The scenery on the north shore of Lake Superior is hardly surpassed on this continent. In some places the rocks rise to the height of from five to twelve hundred feet. A great number of rivers, large and small, seek an outlet in this lake, and all are alive with trout. The very names—Garden, Goula, Agawam, Steele and Nipegon—set my heart beating with memories of the speckled beauties. For good sport in the rivers it requires just the right height of water. If too high, the pools are deep and the fish scattered; if too low the fish leave the rivers for the lakes. The surest time for success is between the 1st of July and the 15th of August. For twenty seasons I have cast my "lines" in these pleasant places. I much prefer what is termed rock fishing, sometimes from the shore, but usually from a boat. The fish thus caught often weigh 5 lbs. or more, in good condition, strong, and game to the last. They always mean business when they take the fly, and rarely fail of being well hooked. We can, if we desire (and I always do desire), have rare sport with a four pound fish for twenty minutes at least, and in the poor fellow's struggles he will often dart away with fifty yards of line. I have taken hundreds of pounds of brook trout in this wild unfrequented region. I have no recollection of ever getting a "rise" at midday when the sun was bright. Take a cloudy day with the surface of water slightly broken, and with an alluring fly the largest, liveliest trout one ever beheld will make the enthusiastic fisherman actually dance and shout with joy. The most reliable fly for these waters is the "brown hackle" with a large body; strong leaders are necessary. Judson Bro. rods are unequalled. I have a four-jointed rod (their make), which I have used fifteen years and it is now in working order. I have another, weighing ten ounces, which I have used five seasons. With it I have safely handled two trout weighing together eight pounds. In my opinion the only reel worth having is made in Frankfort, Ky. The "copper-colored native" does not require such an elaborate outfit. With a rude pole which has no joints, a short twine and full of knots, and red flannel for bait, he muffs something, which being interpreted, means "come hither," and they immediately rise. Last season I made my annual pilgrimage to my favorite haunts. Left Detroit on the evening of the 5th of July; arrived at Lake St. Clair on the morning of the 7th; fished the Rapids as usual two or three days. Then old George (who has been my faithful half-breed for fifteen years) put camp equipage and one week's supplies on board a Mackinaw boat and we started for Gros Cap. We were absent five days, and then returned to the Sault with 190 pounds of brook trout, not one weighing less than 2½ pounds. We took three hundred pounds of ice, so the fish were in splendid condition. I avail myself of this opportunity to inform the fraternity that whoever goes the way I go will find at the Sault all kinds of provisions for camping, but no tents and no suitable fishing tackle. En route take rest and lodging at the "Chippewa," Sault St. Marie. Everything neat and wholesome, and mine host and hostess Smith ready and willing to serve. S. D. E.

—The position of a Commissioner of Fisheries, is one which entails no small amount of trouble. Aside from the details, of a strictly official character, the amount of active work required in policing the various rivers and streams, is immense. One great source of annoyance to an efficient and honest officer, desirous of doing his work thoroughly, is derived from the complaints of well meaning persons, who too frequently bring forward charges of infringements of the fishery laws, which cannot be substantiated. Some time ago we gave in the FOREST AND STREAM notice of certain complaints directed towards the condition of certain rivers in Nova Scotia. We believe now that such complaints were altogether of too sweeping and general a character, and we publish herewith a letter from the Commissioner of Fisheries of Canada in regard to the character of such complaint, which we thoroughly endorse. We would the more particularly call the attention of our readers to Mr. W. F. Whiteher's letter, because, as our own rivers, we trust, will shortly be under proper surveillance, it may be wise to inform all the friends of protection that when charges of infringement of the laws are made, all the facts

should be clearly and perfectly stated. Sending in charges based only upon hearsay, must tend not only to embarrass the actions of the commissioners, but may in many ways hamper their future efforts:

EDITOR FOREST AND STREAM:—

Accept thanks for useful information respecting the Margaree River. There are peculiarities of a local nature connected with this stream which render it very difficult to deal vigorously with any matter affecting control of the salmon fishery. Hasty or inconsiderate action might really produce more harm than good. But it may be possible, by judicious enforcement of the fishery laws, to remedy the evils complained of at an early date. The department took immediate steps with a view to ascertaining certain facts and understanding the exact condition of things.

Occasion is taken to remark that any definite information of neglect of duty, or violation of the fishery laws, within the knowledge of readers and correspondents of FOREST AND STREAM will be thankfully received by me, and will meet with courteous and discreet attention. Specific statements in such cases promote the public interests and are serviceable to officials. But vague stories and random assertions can serve no practical purpose.

It would be preferable if persons knowing of circumstances which demand official notice should promptly inform me, instead of hurrying into print. Experience teaches me that these reports usually prove exaggerations, and being inaccurate in some particulars, afford a plausible pretext for general denial.

Unlike Dr. Richardson's narrative respecting the Margaree, which relates facts, the "resolutions" of the Halifax Fishery Protection Society, printed in your last issue, ignore such vulgar materials. If, instead of a general allegation about neglected inland fisheries, the society would inform this department of the "many of our streams and rivers" which "are illicitly netted and speared," and of the "numbers of mill-dams unprovided with fishways, and many others with quite inefficient contrivances for the free passage of fish," it would be easy to investigate each instance and remedy the abuses specified. But as it is, nothing further is accomplished than to sow broadcast through the press intangible charges, calculated only to annoy, and to discredit among strangers a public service of domestic character without affording the slightest assistance to those concerned, or benefiting any person at home or abroad. I hope these sportsmen shoot more accurately with their guns than they do with their society pen. They remind me of the reckless fowler, who fires wildly at the flight and wounds several birds without touching the one at which he should have aimed—feathers the net result.

Yours,

OTTAWA, Canada, 14th April, 1894.

W. F. WHITEHER.

TROUT-BAITING WITH MICE.

EDITOR FOREST AND STREAM:—

I was talking one day this week on the subject of fly fishing with Mr. Brainerd Howell, the genial and gentlemanly Deputy Surveyor of the Port, (and by the way Mr. H. is a very enthusiastic as well as successful disciple of Walton, and has one of the most complete and extensive fly-books, with other fixtures to match, I ever saw) and he spoke to me in regard to a letter he had recently received from a friend, and as it contained an item that might be of interest to your readers, and the same being your opinion, you will "make a note on."

Doctor Dart, of Highland, while fishing in a stream last season in Ulster county (or Sullivan, I do not remember which) was fortunate enough to secure a large trout in which, upon opening, he found the body of a field mouse. This, to an inventive and wide awake sportsman, was sufficient to start a train of ideas that would eventually lead to a certain result. The Dr. knew that in this pool or deep hole of the stream there were some large trout, for he had secured one; but no fly, however well he might cast it, would tempt another. Upon reaching home that evening he set his traps and caught three field mice, and on repairing to the stream the next day he hooked one through the skin of the small of the back to his fly line and gave a cast towards the middle of the pool. The line being light gave the little fellow pretty free scope, and he swam lively for the shore. But behold! Almost immediately there were several grand rushes from different directions. Poor mousey disappeared, and the delighted Dr. fastened to, and after scientific play, successfully landed a two-pounder. This was repeated with the other two mice, the Dr. capturing in a very short time with this unique bait three of the largest and finest specimens of the *salmo fontinalis* that had been seen in that region for years.

What think you of *ridiculus mus* as a killing bait? And would it not be advisable for us to take along a small cage of *Muridae* on our extensive trips to those regions where the big ones are that you so glowingly describe in your book, the "Fishing Tourist?" Hope some one will try it.

JACOB STAFF.

MEACHAM LAKE, DUANE, N. Y., April 27, 1874.

EDITOR FOREST AND STREAM:—

Our mutual friend "Haviland" has often requested me to give you a few lines from this, "my home."

Since Nov. 25th I have been entirely alone, and have had a fine chance to note the condition of the game. During this remarkable winter the deer have not been obliged to yard it at all; have been roaming the woods as in summer, and everything in the way of small game has been in sight almost every day. In March I found and killed two woodchucks. I never saw them in this country before the middle of April. Partridge are very plenty, and unless we have long continued rains to kill the young broods we will have fine shooting this coming season. The deer are fat. You may wish to know how I know it. Three weeks ago a pack of wolves drove a fine doe on to the lake, about two miles from the house, and killed it. I saw one of them at it and thinking it was a dog, drove over to it and found they had eaten all but one hind-quarter, and that showed more fat than many killed in October. The wolves have since killed two sheep for one of my nearest neighbors, six miles away. My nearest neighbor is five miles away. And here let me say I have known of but one deer being killed in this town since the close season began. The game laws have been pretty generally respected in this section during the past year, although everybody grumbles at them, as made by men who know nothing of wild game or the necessities of the people living in these game regions, some of whom must starve but for the deer and fish. There has been very little fishing through the ice. I tried it one day and caught twenty-six pounds of speckled trout, and one salmon trout weighing five pounds. The prospects for the season are very good. The ice has been so light and free from snow that the fish have been better able to feed, and are in fine condition for this season of the year.

I have had reports from the Raquette River and Saranac Lakes. They have been taking great numbers of pickerel during the winter. These sharks were put into Long Lake in the year 1866, and have increased and wandered out into every water they could reach, and have been carried into other waters by guides who are too lazy to work, but who can sit and haul these worthless fish from waters once filled with trout. We do not know that they are in any of the St. Regis waters now, but expect they will be soon. In conversation with Paul Smith, a few days ago, I told him the only thing we could do was to fight the pickerel with black bass. As soon as I am sure the pickerel are in St. Regis waters I will put bass into this lake, but dislike to anticipate them by putting in bass before they are needed.

Two years ago I hatched and turned into the lake about forty thousand young salmon trout. Last season I put into my hatching boxes about two hundred thousand eggs; think I saved at least three-fourths of them, and I am now under obligations to my patrons to hatch and turn into the lake at least fifty thousand each year. I may be obliged to put in an extra fifty thousand for the pickerel, but hope not.

The "sporting season" promises to be an early one, and from all sides I hear the questions: When can we come? When will the fishing begin? I can only answer, as soon as the ice is out. From October to May seems a long time to hang up the rod and gun. And to us in the woods it seems

a long time to be let alone. But we are expecting to see the ice leaving us now any day. It has been very poor all winter, but the first day of April gave it a new hold, the thermometer at 6 in the morning indicated 9 deg., and did not get above 13 deg. during the day. The spring birds have been here some time. The song sparrows were singing very lively yesterday morning, but before noon it began one of our worst snowstorms; since last November a fall of six inches of snow; to day has been bright and warm.

To all over-anxious hunters and fishermen I can only say, Don't get excited; get your guns and tackle in good order, come prepared to kill the "big buck" and to catch the "big trout;" they are waiting. I once caught the "big trout." Haviland once asked me to try his new rod. I did, and caught a speckled trout weighing 4½ pounds. I gave it to H., who sent it to the maker of the rod—Wm. Reed, Boston.

A. R. F.

TOLEDO, OHIO, April 29 1874.

EDITOR FOREST AND STREAM:—

I enclose our new game law for this State, thinking it may be of use to you. I was very much pleased with the article on the Grayling in your last issue, and would say that you can find the trout and grayling in the Jordan, a stream twenty yards wide in Antrim county, Mich. I caught a grayling and trout at once, having a bobber and dropper on my line. The grayling weighed a pound and the trout a pound and a quarter on the scales. The grayling is as gamey as the trout, and, so far as my experience goes, is not so easily handled as the trout, being very active and strong in the water.

S. H. S.

71 BROADWAY, N. Y., May 2, 1874.

EDITOR FOREST AND STREAM:—

I see one of your correspondents wishes information on the subject of chub fishing. I have caught the Silver Chub or Fall Fish in great numbers in Canandaigua outlet, where they, as well as the black bass, are very plentiful. They are not as gamey as the trout or bass, but still on a light trout rod they are very active and not to be despised. There is but one way of catching them worth speaking of, and that is with a fly; any fly will do, such as the professor or grizzly king. Canandaigua was once a salmon and trout stream, but now the water is too cold and dams to many for either of the above fish, but as I said before the chub and black bass are very numerous and afford excellent sport to the fly fisher. The chub rarely exceed a pound and the bass two pounds in weight, though in Canandaigua Lake I have often taken the black bass weighing 3 and 4 pounds on a light rod. Yours truly,

W. C.

New Publications.

ANNOUNCEMENTS.

Woman, Love and Marriage. By F. Saunders. N. Y. G. W. Carleton & Co. 1874.

Chadwick's American Cricket Manual for 1874. Robt. M. DeWitt. New York.

THE AMERICAN ROWING ALMANAC AND OARSMAN'S POCKET COMPANION. By Fred J. Englehardt, boating editor of the *Turf, Field and Farm*.

The second edition of this work comes to us at rather late date. It contains an immense amount of useful and practical information to boating men, also a series of maps showing the rowing courses at Saratoga, the Upper Hudson at Troy, and the Harlem River.

WINEFRED'S JEWELS. By Mary Atherstone Bird. Philadelphia. H. W. McKinney & Co.

Somewhat sensational in character, but nevertheless written in a very forcible and highly entertaining style. One does not tire in the reading of Miss Bird's novels; they are full of incident, lively in character, and upon the whole improving and reformatory.

CLOUDED IN MYSTERY. By M. A. A. B. Philadelphia. H. W. McKinney & Co.

This is a tale of English life in which there is a "mystery," the solving of which makes up this pleasant story. The subject is quite ably handled, and we sincerely hope the author will again take the pen and give us another work as interesting as is the story, once "Clouded in Mystery." In this work there is a sprinkling of good and bad. Villainy is here vividly portrayed in all its natural deformity; but it is of an entirely different character from that we find in "Winefred's Jewels." It is very readable.

THE LIFE OF EDWIN FORREST. With personal recollections. By James Rees (Colly Cibber). Philadelphia. T. B. Peterson & Bro.

The public, since the first announcement of this accurate and highly interesting reminiscence of the great actor, have been looking for its appearance with much interest. Edwin Forrest, the great delineator of life and its varying passions, has for years held a firm place in the esteem and affection, not only of the friends of the legitimate drama, but also of others in the public and private walks of life. Mr. Rees is perhaps better qualified to write a true, impartial life of his friend Forrest than any other man, from the fact that his acquaintance with the great actor commenced with the days of his early boyhood. Enjoying, as he did, the closest intimacy for the long period of fifty years, he knew well the man of whom he writes, and we are gratified to take up a work, not only very reliable for its accuracy, but which is to be regarded, as we believe and trust, as a true and veritable transcript of the inner as well as professional life of a truly great man. This work contains a fine statutory likeness of Edwin Forrest, makes a volume of over 500 pages, is printed on good paper, and will find a ready sale to every one who was the friend of Edwin Forrest.

Popular Science Monthly. N. Y. D. Appleton & Co.

The lovers of science, of reliable and philosophical research, have in the number for May one of the best for the season. It contains thirteen articles, and where every article deserves a separate notice we can do no better than heartily commend the whole.

PEN PICTURES OF EUROPE. By Elizabeth Peake. J. B. Lippincott & Co.

Although written as a series of pen pictures or sketches, and observations of travels, many of the scenes described by her having previously been viewed and written upon by other tourists and travelers, are nevertheless fresh and entertaining. Freely illustrated by 66 full-page plates of places seen, some of them are very good indeed, while in others we find less merit, and though somewhat striking in themselves, we are not well pleased with them. We love the bright, sparkling freshness of tone that pervades this work, and a racy picture-escapeness not found in the descriptions of guide books for travelers; and this is a book no traveler over these places of note should be without. It is a pleasant companion for an hour. We commend it to our European tourists.

PET; or, Pastimes and Penalties. By H. R. Haweis, M. A. N. Y. Harper & Bros.

Our friends will remember Mr. Haweis as the author of one of the most genial, as well as pleasant books of the day, under the title of "Music and Morals." His new "Pet" will be found one of those pleasant, improving compositions, in which the duty of doing right in preference to wrong is forcibly illustrated in the autobiography of Ben, the boy-lover of "Pet" with much freshness. These "pastimes and penalties" run along together with a judicious commingling and a childish simplicity not lost sight of during the entire narration. A rare and fact noting book.

ADVENTURES OF AN ATTORNEY. By Sir George Stephen. Boston. Estes & Laureate.

We welcome this re-publication as one of the many entertaining volumes of the day. The "Adventures of an Attorney" in search of practice has already taken a deservedly high position in the literary world, and its graceful, genial humor, and quaint professional style will secure it favor, particularly among law students and young barristers.

PRIZE LIST.

FOREST AND STREAM

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.

It is the OFFICIAL ORGAN of the

FISH CULTURISTS' ASSOCIATION OF AMERICA.

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport of Indian Skins, two pounds "Vanity Fair," which I declare to be the best Tobacco I ever smoked. We have very good tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair" is the King of all, by its aromatic flavor and the right sort of strength. My friend in New York got an appointment in California, by that reason I apply immediately to you, begging you to send me for the enclosed ten dollars, a supply of "Vanity Fair," and send with the next steamer to Germany. If there is a German firm that sells your excellent "Vanity Fair," I beg you to enclose me the address.

FISHERIES...MADE TO ORDER

for the trade. Every

variety of Net, Seine, Dredge, &c. suited to Sea, Lake Pond or River. AMERICAN NET AND TWINE CO., Boston. \$5-6m

HAVANA LOTTERY.

Important Notice.

For the coming drawings, commencing January 8th, we have reduced the price of tickets as follows:

Wholes \$20, \$10, \$5, 1-5 \$4, 1-10 \$2, 1-20 \$1

We are prepared to fill all orders. Circulars sent upon application. Highest price paid for Spanish Bank Bills, Governments, Etc.

TAYLOR & CO., Bankers,

11 Wall Street, N. Y.

HOME! HOME!! HOME!!!

At Flushing, six miles from New York; 103 trains daily from 6 A. M. to 12 at night; a yearly commutation ticket free.

(Fare 8c. by package tickets.)

For sale, a French slate roof House, filled in with brick; gas, water, marble mantle; good closets; sewer connections, with double plot of ground, guttered and flagged.

Price \$4,000.

The owner intends to sell, and any party who can invest in a home, from \$500 to \$2,500, will address Box No. 142 Post Office, obtain a free pass to Flushing and full particulars.

Feb-2

Miscellaneous.

For Forest and Stream.
THE ROYSTERER'S PARADOX.

BY A. J. M'GINKS.

[Late Dialect Professor in St. X's College, and now Resident Director of
a Street Crossing Company.]

MUSING near a Limestone Quarry,
Micaceous lava by my side,
Wrapt in melancholy—sorry,
I watched the trapezoidal tide.

The Tmesis singing in the skies
With stereoscopic euphony,
The harsh Ophidian's towering cries,
Ne'er roused my deep cacophony.

At length I woke in climax wild
And peering thro' the glimmering sheen,
Upstart, wondering how beguiled
Had sulphuretted cynics been;

For, right before me stood a form
Arrayed in cataplastic guise,
And in his hand, from murder warm,
A syncope of hugest size.

He waved his sarabund on high,
His catapultic visage frowned,
While flashed his therapeutic eye
On fossil bivalves crusted round.

"Thou subterfuge!" I hoarsely cried,
"What pericardium brought thee here?
Thou diatribe of perchloride!
Prepare to meet thy lager beer!"

The beetling cliff incumbent reared
Behind the Roysterer's paradox,
And soon his concrete head appeared
Infinitesimal on the rocks.

MORAL:

When prophylactics raise their heads,
Or Legislative lenses frown,
Ne'er pause where plastic folly weds,
But strive at once to knock them down.

For Forest and Stream.
The Yellowstone Valley.

ITS CHARMS FOR SPORTSMEN.

MANY of the journals and periodicals have occasionally made mention of the famous Yellowstone Valley of Montana, and have spoken of its many natural wonders and curiosities, but few, if any, have made any reference to its advantages as a field for the sportsman. Of its famous geysers, its curious mud fountains, its frost-like incrustations of every hue and shade, its magnificent lakes, its thermal springs and varied scenery, accurate accounts have been given by Donne, Hayden, and others. But that it is the favorite summer resort, the Newport and Saratoga of the grizzly bear, the California lion, and innumerable varieties of fur-bearing animals, and of the feathered tribes; that the lakes, both large and small, fairly teem with trout, and, as one writer says, "there are no small trout there, few if any weighing less than a pound," almost no one has heard.

This natural basin was once the crater of an immense volcano, the smothered fires of which still burn far below, showing their power by the immense jets of water, sometimes three hundred feet in height and ten in diameter, which they force up. At present it appears as a sheltered valley, from twenty to forty miles in diameter, at an altitude of some 6,500 feet above the level of the sea, well wooded and watered, and surrounded by mountains whose tops are covered with eternal snow. Entrance to this valley is through the cañon of the Yellowstone, and this can be gained only during the months of June, July, August, and September. There is also a trail over the mountains, touching the upper end of the valley leading from the great Shoshone Falls and head of the Snake River, via the head waters of the Madison and Gallatin rivers—both of which have valleys similar to, but much smaller than the Yellowstone—to the great buffalo range between this district and the Missouri. This is known as the Bannock trail.

The sportsman will go by the Pacific Railroad to Evans-

ton or Cheyenne, and thence to Fort Ellis, Montana, which last place is but five or six days from the Great Basin, with fine hunting and fishing all the way. He will require heavy clothing, and all the requisites for camping out. The travel will not be found especially difficult, nor will the danger be great, as the Indians, having a superstitious reverence for the valley, believing it to be the abode of the Great Spirit, never enter it. Says one writer:—"The only traces of Indians we had seen were some shelters of logs, rotten and tumbling down from age, together with a few poles standing in former summer camps; there were no fresh trails whatever. Appearances indicated that the basin had been almost entirely abandoned by the sons of the forest. A few lodges of Sheepstealers—a branch remnant of the Snake tribe, wretched beasts who run from the sight of the white man, or any other tribe of Indians—are said to inhabit the fastnesses of the mountains around the lakes, poorly armed and mounted, obtaining a precarious subsistence, and in a defenceless condition. We saw, however, no recent traces of them. The larger tribes never enter the basin, restrained by superstitious ideas in connection with the thermal springs. A party of three can travel with perfect safety, so far as Indians are concerned, in any part of this district by keeping watch upon their horses at night, as the lions would make short work with them if an opportunity was afforded, horseflesh being their favorite diet." Whether the present Sioux imbroglio will make any difference in this respect I am unable to state, but in so far as the Great Basin itself is concerned I presume it will be little or none.

To give an idea of the abundance and variety of game I append a few paragraphs taken from the official report of Lieut. Doane, Second United States Cavalry, who visited this valley in 1870. This officer started from Fort Ellis, Montana, on the 22d of August, struck the Yellowstone in about eight hours; entering the valley through the great cañon of the Yellowstone. The Yellowstone abounds in trout; the writer says:—"The Yellowstone trout are peculiar, being the largest variety of the genus caught in waters flowing east. Their numbers are perfectly fabulous, but their appetites extremely dainty. One may fish with the finest tackle of eastern sportsmen, when the water appears to be alive with them, all day long, without a bite. Grasshoppers are their peculiar weakness, and, using them for bait, the most awkward angler can fill a champagne basket in an hour or two. They do not bite with the spiteful greediness of the eastern brook trout, but amount to much more in the way of subsistence when caught. The flesh is of a bright yellow color on the inside of the body, and of a flavor unsurpassed."

I think all the Yellowstone trout are salmon trout, though the brook trout is, I believe, caught in most of the mountain streams of this region.

"Our mess table was here supplied with antelope, hare, ducks and grouse killed during the day (on the march), and with fish caught *ad libitum* in the afternoon."

Passing through the cañon, and arriving at the mouth of Gardiner's River, the Yellowstone "at this point shrinks to half its usual size, lost among boulders of the drift, innumerable masses of which choke up the stream in many places, forming alternate pools and rapids, which afforded great delight to the fishermen of our party. Coming into camp in advance, passing through a grove of pine on the margin of a little creek, I was met face to face in the path by two magnificent buck elk, one of which I wounded, but lost in the woods. Shortly afterwards Mr. S— started up a small bear, which also got away. The ground was everywhere tracked by the passage of elk and mountain sheep, and bear signs were everywhere visible."

Three miles below the Yellowstone Falls the chasm is 1,050 feet deep; on the "caps of the dizzy heights above the mountain sheep and elk rest during the night."

Entering the Great Basin over the high ridges, as they descended they "found a large flock of mountain sheep, very tame, and greatly astonished, no doubt, at our sudden appearance. Elk were feeding in small bands on the other side of the valley, and large flocks of water fowl were fre-

quently seen sporting in the river channel. Here trout were caught in abundance."

At the Great Yellowstone Lake, at the mouth of creeks emptying therein, are "large, swampy districts, flooded, and the resort of myriads of water fowl. The waters of the lake "abound with trout to such an extent that the fish at this season are in poor condition for want of food. No other fish are seen; no minnows, *no small trout*. There are also no clams, crabs, nor turtles—*nothing but full grown trout*. These could be caught in mule loads by wading out a few feet in the open waters at any point, with a grasshopper bait. Two men could catch them faster than half a dozen could clean and get them ready for the frying pan. Caught in the open lake, their flesh was yellow; but in bays where the water was strongly impregnated with chemicals, it was blood red."

"The whole valley is filled with pools of water, a resort for great numbers of waterfowl. The ground was trodden by thousands of elk and sheep. Bear tracks and beaver trails were also numerous, and occasionally was seen the footsteps of a California lion. During the night we were several times disturbed by the dismal screaming of California lions, and in the morning found their huge tracks close around the camp. In the evening a grizzly bear, with cubs, was roused by some of the party, but as they had not lost any bears she got away with her interesting family undisturbed. These animals are very numerous in the basin, the green grasses, berries, and pine nuts affording them abundant supplies of food. The small lakes are perfectly alive with otter, which may be seen playing upon their surfaces at nightfall by hundreds. Beaver, mink, and muskrat are also abundant.

"In the evening large numbers of fish were caught, Private — catching *fifty-two large trout*, all that two men could carry, in less than an hour. In the early morning we were serenaded by a couple of lions, their melancholy voices echoing through the heavy forest with a peculiarly wild, mournful sound.

"The water fowl on the lake deserve a passing notice. These include swans, pelicans, gulls, Canada geese, brant, and many varieties of ducks and dippers. There are also herons and sand hill cranes. Of pelicans, immense numbers sail in fleets along the lake, in company with the majestic swan. The gulls are of the same variety as those found in San Francisco harbor. I think the pelicans are identical with those found in the great lakes on our northern border, but am not sure, as we did not get a specimen. There are several low, flat islands in the lake, which are always white with them at the close of the day. Of the birds and animals of the forest, I have seen of each several not down in the books—comprising, of birds, a sort of large mocking bird, two varieties, belonging, I think, to the genus '*corvus*,' two kinds of woodpeckers; two or three specimens of grouse; also a guide bird, resembling a black bird, but larger. I saw but one of these, the day I went to the bottom of the Great Cañon; it hopped and flew along from rock to rock ahead of us during the whole trip down, waited perched upon a rock while we were resting, and led us clear to the summit again in the same manner, making innumerable sounds and gestures constantly to attract attention. Others of the party remarked birds of the same kind, and acting in the same manner. The common birds of the basin are eagles, hawks, ravens, ospreys, prairie chickens, and grouse. Of animals, I saw several species of squirrels and weasels, which do not appear in the books. We saw no snakes of any kind in the basin.

"Crossing the river we moved down to a central point of the valley, and camped in a little grove of pine timber near the margin of a small marshy lake, around which were to be seen numerous fresh signs of buffalo, driven out by the noise of our hasty intrusion."

It will thus be seen that the abundance and variety of game is not exceeded in any other part of the country, and from its being undisturbed by Indians is comparatively tame, so that no difficulty would be found in "making a large bag."

Lieut. Doane made the entire trip from Fort Ellis and return in thirty-four days, and part of that time was unable to travel on account of a severe "whitlow." He adds:—"The difficulties of the journey amount to but little after the various routes have been laid down correctly. From the 1st of June to the 1st of October the climate is very mild considering the location. Both the climate and vegetable growths of the Great Basin are strikingly different from those of the surrounding country. The summer, though short, is quite warm, notwithstanding the elevation of the district. Rains are frequent in the spring months, and the atmosphere is comparatively moist. All the grasses grow rank, and are not of the seeded varieties common to the country, being green and luxuriant when the lower valleys are parched by the sun. Ferns, huckleberries, thimble-berries, and other products of a damp climate abound, all being of diminutive growth. It is a miniature Oregon in vegetable productions, the pines being about the height of those on the East Virginia shore, and other growths lessened in proportion. Mosquitoes and gnats are said to be numerous in the early summer, but we saw none at all. The snows of winter are very heavy, but the cold is not severe for such an altitude. Doubtless the intense heat and immense amount of hot vapor evolved exert a powerful agency in moderating the rigor of the climate. The basin would not be a desirable place for winter residence. As a country for sight-seers and sportsmen, it is without parallel; as a field for scientific research it promises great results; in the branches of geology, mineralogy, botany, zoology, and ornithology, it is probably the greatest laboratory that Nature furnishes on the surface of the globe."

All of the above is corroborated by Hayden and others who have since visited the valleys and classified its flora and fauna. What a magnificent field for the sportsman! Who is bound for the Great Yellowstone Valley this summer?

MONMOUTH.

For Forest and Stream.

HUNTING THE WILD TURKEY.

THE wild turkey (*Meleagris gallopavo*) is, without doubt, the finest game bird on this continent. Large, with burnished plumage, spurred and bearded, he is a magnificent fowl. The flesh is tender and juicy, and as gamey in flavor as a partridge. His endless variety of food makes it always procurable, and in season he is never found thin in flesh. To hunt him successfully in regions where he is much sought after and shot at, requires the utmost skill and tact on the part of the hunter, and an intimate knowledge of all the habits of the bird. Exceedingly shy, with a keen eye, an acute sense of hearing, a quick flight and a fleet foot, he is extremely hard to get within range of. After many hours spent in calling or stalking him, just at the moment you think he is safe for a "bag" a slight movement or exposure of part of the body of the hunter, the breaking of a dry twig or the cocking of your gun, is sufficient to alarm him, and he is off instantly.

In the spring, when they "pair off," is perhaps the most favorable season for hunting them. The voice of the gobbler is now heard in the land, and a few evenings since the 7:30 train bore away to the "Pine Hills," on the borders of a quiet stream fifteen miles east of this place, two mighty slayers of the *gallopavo*. They were armed and equipped as the law directs—each with a mighty ten bore, cooked rations, and some that were not cooked, a tin coffee pot, etc. The next dawn found them in the woods, with listening ears and cautious footsteps. Occasionally they gave a yelp on their well tried callers, but no response. They hooted in imitation of the night owl; all was silent. They then separated, "Senior" taking a route along the foot hills, and "Junior" striking down a narrow beech ridge that ran parallel with the creek. After walking until the sun was rising, the weary "Senior" sat down to rest and refresh himself. He had gained the summit of a steep hill, and his seat was a step-like rock. Behind him, a little higher than his head, as he sat, was another rock that reached to the level summit of the hill, and hid him from view from that direction. In the valley below wandered the placid stream. The "sweet south wind" sighed softly through the tops of the lofty pines, and swayed the branches of the forest trees just budding into leaf. All nature was putting on her spring garments. The woods were vocal with the songs of the birds; the squirrels frisked about, looked inquisitively at the hunter, and then ran off to practice gymnastics on the swinging boughs.

All this beauty and freshness and gladness was enjoyed by the mighty hunter. After resting awhile, he gave a few call notes in imitation of Madame Gallo. Instantly there came a gobble in response that made his heart bound, and sent the blood tingling through his veins. It almost made the old ten bore vibrate, it was so near and so sudden. This gobble was followed by one from a turkey a little farther off. The nature of the ground prevented either hunter or hunted from seeing each other. The nearest turkey was not more than thirty feet off; the other as many yards. The hammer was drawn back without a click, and as the turkey was right behind him "Senior" had to turn round to shoot. Cautiously he turned, but his foot touched a loose stone and sent it rolling down the declivity. This was enough for Gallo. Instantly, with a loud "cluck, cluck," a rush, and flapping that stirred the dry leaves like a whirlwind, he took wing, but in vain. For an instant "Senior" followed him with his gun, covered him, and pressed the trigger; there was a cloud of smoke, a report that shook the everlasting hills, and the immense bird fell with a thud, cut down like a bob white in mid air. At the report the other turkey took wing, and, well for him, got a tree between himself and the enemy. Thus he flew until almost beyond shot. The old ten sent a whistling shower of lead after him, but he was in a hurry to go, and only left his card.

Meanwhile, "Junior" had not been idle. He had called up and killed a fine hen, and after waiting half an hour heard a gobble in answer to a call. This old fellow was so near that "Junior" had barely time to flatten himself on the ground before he came in sight. He was a splendid bird, with blue head, shining feathers, and sweeping beard. But he had heard the sound of battle from afar off, and was on the alert. He moved round on the left flank, cautiously scanning every object. It was impossible for "Junior" to move without being instantly seen. He watched the turkey from the corners of his eyes, scarcely daring to breathe, his gun lying cocked in his grasp. To lie still till the turkey comes within range, and then spring up and fire is his only chance. Nearer comes the turkey, almost in shot. Then suddenly, as if he had discovered the enemy, he gave two loud clucks, *qui-va-la*, and commenced moving

off. A quick shot, and he falls, but is up again; another shot, and he cannot fly, but still keeps running. "Junior" lays down his gun and gives chase, but the swamp into which the turkey runs is too soft to support the weight of the hunter, and the mighty gobble passes out of sight. "You will have to roost lower for the balance of your days, old fellow," is the soliloquy of "Junior," as he sat down to get his breath. "If I could only have found a log to hide behind I would have bagged you."

After returning to the bivouac, making an immense hole in the commissariat, and killing their birds over again about three times each, and resting their weary limbs for a while, they again took the war path. "Junior," while sitting on the summit of a steep hill, heard a low yelp. He laid flat on the ground, and answered the call. The turkey—a young hen—came up within close shot, but was concealed below the hill. Fearing she would get around on the flank, he gave a call, and in doing so made a false note, at which she rose with a cluck and perched in a tree just overhead; but her feet had scarcely touched the limb when she fell backward, her head riddled with a charge of shot.

"Senior" was in the bottom, and seeing fresh "sign" sat down by a fallen tree and commenced calling. Soon there came an answer right in front, and with cocked weapon he awaited the coming. After a little time the yelp was heard close behind him; the turkey had made a detour and had got in his rear. First a young gobble came in view, then a hen, then another and another until eight were in view. The hunter was on "the wrong side of his works," and in a perfectly open place. He could not move, and the birds were not quite within range. They came a little nearer and stood with heads up, looking intently around. At last they made out the enemy, and with many clucks made slowly off. 'Twas a long shot, but the only chance, so he let drive at the nearest one, a hen. She fell, fluttered an instant, and then took wing; but, partially stunned by the shot, she flew nearly towards the hunter, who dropped her neatly with his left. In an hour another hen was called up, and as she stuck her head from behind a tree to get a look at the foe, had it filled with shot, and fell with many a flirt and flutter. "The sweet south wind" had by this time risen almost to a gale, and, roaring through the trees, made it impossible to call any more, or the whole flock might have been bagged, as they were well scattered, and came readily to the call.

Late in the afternoon, as the hunters were returning to the station, while sitting down to rest, they heard a "gobble," but could not make out the point from which it came, and could not get an answer to a yelp. The turkeys came on however—an immense cock and a hen—but passed by out of range, and disappeared in an impenetrable cypress "brake."

The birds bagged—five in number—were all in fine flesh, the cock weighing twenty-two pounds, and your humble servant managed—as the old woman said about the rye, after they got it made into whiskey, "to worry down a little"—of one of them, although he was not stuffed with *foi gras*.

Corinth, Mississippi, May 25th, 1874.

For Forest and Stream.

FARMERS vs. SPORTSMEN.

THE question whether game is the property of the owner of the land on which it may have been bred, and the right of the sportsman to go there for the purpose of shooting it, is causing much discussion, and an issue is created which the sportsmen will have to meet before long. Already has the war-cry been sounded by the farmers in Ohio, and there the first battle is being fought, but with what result it is at present difficult to surmise; but perhaps it will be decided before this reaches you. No matter which party may succeed, that will not be the end of it, for if defeated the farmers will try it again, and if the sportsmen should be the beaten ones, most assuredly will they try next year to have the law repealed. And now that the ball has been started rolling, the farmers in other States will give it a kick and keep it rolling.

As usual, there are two sides to this question, and at the risk of being decried by my brother sportsmen, I take the side of the farmer. I know it is usual to picture the farmer as a gouty, unaccommodating individual, actuated by mercenary motives in not allowing shooting on his land. That this is the case in some instances I will not deny, as I have known instances where farmers prohibited shooting on their land because they desired to trap the game for market. But these, I think, are the exception; and where is the rule without it? A whole body of men must not be judged by a few. My experience and sense of justice to all compels me to say that in the majority of instances I have found farmers clever and accommodating; but like every other class of persons they like to have their rights and property respected. And who is there that does not? No man likes to see his rights ignored, and therefore why should a farmer be expected to sit quietly down and hold his tongue because a party of men—strangers to him—desire for their gratification to tramp over his property? And has not the farmer good cause for his objection? Is he not often absolutely damaged by these forays on his property? and not only that, but, besides, gets cursed and abused because he objects to this injury, and dares to assert that his rights to his property are to be respected.

I know whereof I speak, for I have seen it. One instance of many similar will suffice to substantiate my statement. Not very long ago, when out shooting, I drove up to a farmer's to ask permission to shoot on his land, when I found quite an altercation going on between him and some four or five men. They were abusing him in a most disagreeable manner. Every low, vulgar epithet that could be thought of they applied to him, and one went so far as to threaten to blow the top of his head off. And all this, as I afterwards found out, was because he ordered them off his place, for the reason that they had gone on without his permission, and had left the bars down and let his cattle out. I asked and obtained his permission to shoot; all he asked, he said, was to put the bars up and not break the fences down. He said no gentleman would go on his property without asking his permission, and he would not allow any but gentlemen to shoot on it.

Now, had that man not just cause for complaint, and was he not right in demanding that permission he asked of him to shoot on his land? I know of one instance where a farmer and his son on Long Island had to go over twenty miles to get their cattle back that had been let out by "shooters" leaving the bars down, and of another where a farmer's wife, while sitting at dinner opposite the open

door, received some pellets of shot in her neck from the guns of some men who, having come on a bevy of quail in the orchard, regardless of their close proximity to the house, blazed away.

These were in neither instance country loafers, but New York "shooters." It must be borne in mind that every man that shoots is not a sportsman, and therefore this unsportsmanlike class must be legislated for, and consequently the innocent, as in all other cases, must suffer for the guilty. Don't be angry, gentlemen, but unfortunately we are as yet only novices as sportsmen in this country. We may be good shots, but being a good shot is not of necessity being a sportsman. What constitutes a sportsman is more than that, and certainly he should be a gentleman. There are of course many exceptions, and therefore let it be understood that I do not include all in this statement, but am drawing the line between a sportsman and a "shooter."

In consequence of the great abundance of game heretofore, and the wanton destruction of it, the effect has been more to rear up pot hunters than sportsmen. It is to-day that we are developing the sportsman.

That game, because it lives on a man's land, is not his property—that is, not his to do with as he likes, shoot it in or out of season as he pleases, or snare it, I most fully believe. It is under the protection of the law, and therefore he is amenable to the law, and bound to observe its provisions in regard to it. But no one can deny that the land is his, and that he has the right to say who shall or who shall not go on it to shoot. A man's house is his castle, and his land his domain, and is not the domain entitled as much to protection as the castle?

Supposing any gentleman should purchase a tract of land and go to the expense of stocking it with game, will any one say that he has not the right to prohibit persons from going on it and shooting? Would it not be a trespass, and ought not the law to afford him redress? Such an idea is absurd, and would entirely subvert all personal right in property. Then, is not the farmer entitled to the same protection?

Increase the penalties for violating the game laws, and bring the farmer under restraint from snaring the game, and at the same time pass a good trespass law, protecting the owner of the land and his property from ruffian shooters. Do this, and I am satisfied that the real sportsmen will be better off for it.

I am sure if owners of property were asked permission to shoot on their land, instead of trespassing without it, in nine cases out of every ten there would be no objection, for the very act of asking would show that the owner's rights were respected, and his authority over his property acknowledged.

In fact, if sportsmen are not more careful of the farmer's interests, game shooting on residential property and leased lands will have to be hired by the sportsman, and eventually become a matter of purchase.

The question need not be one of war between farmers and sportsmen if wise counsels and conciliatory measures prevail on both sides, but can be settled satisfactorily to both parties. And this is another of the many things to be settled by the National convention.

FOX HUNTING IN ENGLAND.

THE COUNTRY OF SHAKESPEARE—NOTES OF TRAVEL.

I AM making a short sojourn at this inland watering place, which will be well known to all American tourists who have paid a visit to the country of Shakspeare. It takes its name from the river Leam, which flows lazily through the town, two miles further on to join the Avon, when, gliding under the walls of Warwick Castle, by world famed Stratford, and battle plain of Tewkesbury, it mingles its waters with the Severn and so to the sea. On one side of the river the ground rises gently, and on the other it is level, and the open country stretches before the eye for miles—a country of pleasant mansions standing in wooded parks, of trim farm houses, of fertile fields, of shady lanes and well kept roads.

Leamington owes its very existence to its mineral waters, the virtues of which became known about seventy years since; their celebrity has caused it to rise from a village consisting of a few miserable mud huts to one of the most populous, well built, and thriving spas in England. These waters—both saline and sulphur—are still held in the very highest repute, and are used as a cure for many diseases, and as a general tonic. But it is not solely as a watering place that Leamington is famous; it is situated in the heart of the finest fox hunting district in England, and is yearly the resort of crowds of aristocratic British sportsmen, who make it their headquarters during the hunting season. Every morning the streets are thronged with red coated riders on their way to the "meet." One of the neighboring packs of hounds daily meets within a few miles of Leamington during the season, often within easy walking distance. A meet is one of those sights peculiarly English. At tollbar, village inn, cover side, ruined castle, or country hall, it is alike picturesque. If at the latter, there is always a hunting breakfast given to the sportsmen, when game pie is washed down by copious draughts of champagne or "badminton." These English hunters still maintain the reputation of their Saxon forefathers, renowned in history and song as mighty feeders and revellers. At the meet all classes are to be seen; the high toned swell in well fitting scarlet coat, buckskin breeches, and shining boots. The whiteness of his breeches and the polish of his boots are his principal anxiety in life. It is considered a calamity to have a speck upon either previous to the "throw off," although in five minutes afterwards they may be covered with mud. Many swells drive to the meet with aprons covering their legs, so that they shall not be soiled by the falling out of the cigar. Then we have the lady riders, in closely fitting habits and coquettish hats, looking most charming, and dangerous to the peace of mind. Farmers muster strongly, and vary considerably in their dress and appointments, many of the younger imitating the finery of the swells. A few sporting tradesmen, a veterinary surgeon or two, a horse dealer, and some boys on ponies make up the mounted throng. Carriages of all sorts are present, mostly filled with fair ladies, who have not the courage to follow the hunt on horseback. Around these carriages the sportsmen linger until the hounds arrive, and headed by the master and the huntsman trot to the neighboring cover and proceed to draw it. Then every one presses to the front, anxious to have a good start, but fearful that the fox may go away from the side of the cover opposite to that where

they have taken their "coign of vantage." The bell-like note of the hounds is heard as they find the scent, and shortly after the bugle sounds the joyful cry "gone away." There is at first a dangerous rush of horsemen, following in the wake of the hounds, but after the first half mile they tail off, and only the real riders are "in it." There are few physical joys in this life like a glorious burst across country. Little by little to find you are creeping to the front, till at last none are left before you, and you are riding neck and neck with the master, or some other staunch man and true; the hounds in front, running well together, seeming as if they could be all covered with a table cloth. To be one of the few in at the "check" or "the death," seems to the true fox hunter about the only thing worth living for. And there is the ride home through country lanes, the glass of home brewed ale at village inn, the soothing cigar passing away the time till you reach Leamington, when the warm bath refreshes you for dinner, and you eat as only fox hunters can. The next day, if you are too tired to repeat the sport, you walk around, and find yourself in about the cleanest and handsomest town in England. The public gardens, in fine weather, will be crowded with the golden haired daughters of England. There are maidens fair to see at Leamington, as well as at Neimar. "Beware!" In unfavorable weather there are promenade concerts in the Jump Rooms, a handsome and spacious building where the visitors assemble to drink the waters and retail gossip. At night, if you wish it, you may attend a ball at the Assembly Rooms. Alike to the sportsman, or the health or pleasure seeker, this place has attractions, and no American should recross the Atlantic without making a sojourn here.

THE QUEBEC COUNTRY.

IN a recent series of articles, descriptive of wild sporting life in Canada, published in FOREST AND STREAM, I have endeavored to draw our sportmen's attention to a grand though undeveloped sporting country that rivals our Adirondacks and Maine woods, and which in point of accessibility is but a few hours behind. For the benefit of those unfamiliar with this region I have designated it as the Quebec country. It embraces an extent of some hundred miles north of that famous and antiquated city. I say hundreds of miles in extent, for the sportsmen, however much of an ambitious or exploring turn of mind, would scarcely undertake the journey through to Hudson Bay or Labrador, though these are its boundaries proper. Within the distance I have prescribed there is still a vast unexplored mountainous tract, among which are numberless lakes, rivers and streams affording each and all such fishing and pleasant enjoyment in the wild camp life as are not to be had elsewhere short of the Rocky Mountains; I do not even except Newfoundland.

The Jacques Cartier is the first river of any importance which you strike after leaving Quebec. It is twenty miles distant from that city and is the boundary of the settlements to the north. The river is extremely picturesque in its meanderings among the numerous islands with which it is dotted and affords some excellent trout fishing. Salmon fishing is still to be had lower down, though it is almost depleted of that fish. It is navigable for canoes for fifty or sixty miles from its mouth, with but few portages. For fuller information of this river see "Hallock's Fishing Tourist," which devotes considerable space to a description of a memorable week spent upon it.

Two day's tramp from the Jacques Cartier is the St. Ann's, a shallow rapid river flowing between high precipitous mountains expanding at intervals into large deep pools, in which lurk some of the finest fish I have ever had the good fortune to take. One of the largest of these pools is called the *Pêche a Maleolm*, an account of which I have given to the readers of FOREST AND STREAM. Between the two rivers are many large lakes, deep among the mountains. *Tontari Grande Lac* and the lakes of the river *Sau Pin's*, afford the finest fishing. It has been no unusual thing for me to take in one day's fishing some twelve dozen fish with a fly in the Tontari Lake and not one wasted. What we could not use were salted and brought out when we returned.

Two Indians only, hunt and trap over this section, and large game is therefore very abundant. Caribou and moose can be successfully pursued here in fall and winter. Spring and summer being the close season, they are not molested. The lakes abound in ducks which breed on the islands.

Outfits must be of the lightest, for everything has to be carried on the back of the guide over high mountains. Leave this matter to the guide and let him procure under your supervision whatever is needful and nothing more. You must expect to carry your own little traps. No tent is requisite, as a bark camp can be soon constructed with little labor.

For guides, we can refer to but few. George Neil, Robert Douglas and young Pat. Cassin, all of Valcartier, are good men. Indian guides, if preferred, and I prefer them myself, can be obtained at the Indian village of Lorette, on the road to Valcartier. Charlo Gros-Louis, Francis and Etienne are good reliable men. I know them personally and can confidently recommend them. There are others doubtless equally as good. All speak enough English to get along with.

Charles Wolff of Valcartier will accord all sportsmen a cordial welcome and put them on the road to good sport. He dispenses his hospitality in true Canadian style. The cost of a trip of two to three weeks duration, including fare to and return, will not exceed \$60. Quebec is reached from New York by Hudson River and Lake Champlain to Montreal and thence to Quebec by boat. The return trip by Lake Memphremagog and Green Mountains and Connecticut Valley, is one of the most charming of rides.

HOW TO SHOOT AT LONG RANGE.

NUMBER SEVEN.

IN my letter No. 5 I described a slight change in the present system of marking, merely consisting of dividing the iron targets into foot squares. Many targets, indeed, are now so divided. The squares would then be indicated by the simple means shown on the diagram given hereafter, which it will be seen aids the memory so much that persons using it would soon be able to remember the number and letter, even if not marked on the target.

In match shooting it is difficult to see how the process can be properly conducted by less than three persons—he who fires, he who marks the hit on the target and scores the bullet mark, and he who at the firing-stand records the hit.

Suppose we are firing at a full size target. The first hit is on the square A. The marker puts his disk on A, and the recorder has no difficulty in deciding from its position what square it is, aided by the signal flag. He enters A, and 2 for an outer. The next is B 3, also an outer. E is a bull's eye, counting 4, and so on. At the larger ranges it would probably be necessary sometimes to aid the recorder's sight by the use of a telescope. In a short time all parties would have a picture of the target in their minds, so they would know the position of such squares when they heard its name called. If a rifleman hears A called he knows that he must aim lower, and to the right; if B 5, higher and to the right; if F 2, a trifle lower, etc. His rifle register would look something like the following:—

Date—June 6th, 1874.

Range—Creedmoor; target 20.

Distance—Nine hundred yards.

Rifle—Remington target; 44 calibre.

Cartridge—Eighty-five grs.; Hazard; musket size; ball, 560 grs., patched and greased.

Angle of Elevation—Two degrees, thirty minutes.

Day—Clear and bright; cloudy after one P. M.; three minutes more elevation required.

Wind—Right; brisk.

Diagram.

Average 2.71

The system of marking now used at Creedmoor, with this addition, would, it seems to me, be preferable to the new method proposed to be introduced at Wimbledon. The simpler any system of marking is the better.

If the telegraph wires were to be used in conjunction with this system they would be arranged just like a hotel indicator. The marker at the but would press the knob lettered B 3, etc., and indicate this at the firing station. This would, however, be an expensive system, as there would have to be an indicator at each firing point, unless the indicator was attached to a cable like a military telegraph, and coiled up or uncoiled as the point was changed.

It is easy to see how this proposed system might be made to almost do away with shooting off ties, for although several of the squares have an equal relative distance from the centre, yet artificial values might be given to them, and then ties would happen very seldom.

T. C. C.

—The following anecdote of a dog "faithful unto death," we believe to be perfectly true. When the Dutch were endeavoring to quell the Belgian Revolt in September 1830, a young officer followed by a rough terrier dog, was killed in Brussels, on the 21st of September. The dog sat beside his master's dead body, licking his face. At length the body was removed for burial, the dog following it, and the terrier remained for three days beside the grave. It then went back to the spot where its master had fallen, lay down on the stone pavement, and would attack any one who tried to remove it. Some cruel people beat it with sticks, and at last chased it away, but a day or so afterwards it came back, but was at last driven off by the carriages. When the dog returned once more to the public square where his master had died, he was worn to a skeleton, from hunger and grief, but never left again the narrow place where he had seen his master last alive. A director of the Brussels Museum, a kind hearted man, saw the poor dog, surrounded by a rabble of street urchins, who were pelting him with stones. He dispersed them, and on enquiring into the animal's history, had a kennel built for him, and gave some money to the guardian of the public square, to expend in food for the faithful creature. The dog soon recovered strength. The children in time soon knew his story and pitted him. He was gentle, up to a certain degree, yet not one of them dared walk over the spot his master had fallen, without his flying at them. In fact he rarely moved off more than ten yards from a particular flag stone. The dog lived for eight or ten years, and in 1838, the dog and his kennel were seen by a gentleman, who has told us the facts. We have seen this story stated before pretty much as above, but we were somewhat skeptical about it, until reassured on the best authority, that it was true in every detail.

How to KEEP FURS.—Make a bag (we use feather-bed ticking) large enough to hold your furs. Be sure they are free from moths or eggs; put them in the bag, tie them tight as you would a bag of wheat, and they will be safe as long as you wish.

—In Barnesville, New Brunswick, is a domestic cat, whose five kittens having been drowned, she adopted a litter of foxes which she discovered in the course of her disconsolate wanderings in the neighboring woods. A St. John gentleman has offered \$100 for the lot.

—Thousands of sportsmen use Kimball & Co.'s tobacco because it is the best.

—Ask your dealer for Kimball & Co.'s tobacco, or send to them for a supply.

The Horse and the Course.

CHINESE HORSES.—"Two or three times a year," writes a correspondent of the *Journal Officiel du Trot*, "troops of horses come to Pekin from Mongolia. By the aid of Chinese horse-jockies Europeans make their selections. Not one of the horses have ever been groomed or mounted, and it is by no means easy for even an expert in horse flesh to know what kind of animal it is he buys, covered as the horse is with a thick coat. Having purchased your horse then commences the real work. Usually the beast is five-year-old, a gelding, and gashed all over with scars where he has been cut during his travels. His mane falls clean down to his knees, you can't see his head for his fore top, and his tail sweeps the ground. It takes no end of care to dress him up in order to get at the real shape of the beast. It requires some management to take him all of a sudden from a life in the plains to the stifled atmosphere of a Chinese stable. The Chinese horse has got wonderful straight sinewy legs and a pretty game head, though not generally elegantly built about the body. One thing about these horses which gives no end of bother is, their dislike for Europeans. They are as gentle as can be with the Chinese, but when an European approaches them, they curl back their ears, squeal with temper and do their best to kick you. It has happened to me more than once on my travels, to have been worried by them. I remember one winter day—when at some distance from the city, just about night fall, when it was bitter cold—to have tied my horse up by the bridle to a tree. The wretched beast kept me busy for a full hour before I could mount him. The blessed Chinese, who might have helped me, seemed to enjoy the sport. Fortunately, after a while, he wound himself up by the bridle, and at the risk of having my brains knocked out, I at last got on his back. Vicious little brutes as they may be, they have nevertheless no end of go in them. Usually they are pony built, but with a weight of 150 pounds, I have known a little fellow to run his mile in two minutes and eight seconds, and the two miles in four minutes and thirty-five seconds. Where, however, the Chinese horse excels is for long journeys. They will go all day without feeding, and at night, if they get a spare handful of hay or straw, sprinkled with a little bran or meal, they are all right for a long journey next day."

—The Kentucky Association of Lexington, Kentucky, commenced the spring meeting on May 11th. There were sixteen entries for the first race, the Phenix Hotel Stakes, for three year olds, one and one-eighth mile dash. Six started. The race was closely contested, McGrath's Aaron Pennington winning by two lengths, Excel and Big Fellow making a dead heat for the second place. The others were not placed. Time—1:57½. The second race was mile heats for a purse of \$300. There were seven entries, all of whom started. Jerry won in two straight heats. Time—1:44½; 1:46.

—The Chickasaw Jockey Club, at Memphis, Tenn., terminated on May 8th the most successful meeting which has ever taken place over this course. The first race was a hurdle race, over six hurdles, distance about a mile and a half, for a purse of \$200. Captain Hutchinson and Chief Engineer made the running from the start, the Chief leading for one mile, when Captain Hutchinson came to the front and won by one length, Limestone coming second with a rush, and Chris. Doyle third. The next race was the Chickasaw stake for three-year olds, two miles; \$50 entrance, club adding \$400. Wm. Jennings's Ballankeel beat Pine & Scott's King Pin, after a pretty race, running neck and neck for one mile and three-quarters. Ballankeel then drew away, coming home the winner by two lengths in 3:47. The last race of the meeting was a Handicap for beaten horses, mile heats, purse \$200, won by Emir in three heats. B. F. Carver won the first heat, and Emir the others. Time—1:47½, 1:47½, 1:49½.

—At the Newmarket first spring meeting, held May 8th, Apology won the 1,000 guineas stake. La Courseuse took the second money, and Blanchefleur came in third. The betting just previous to the commencement of the race was 3 to 1 against the winner, 3 to 1 against La Courseuse, and 10 to 1 against Blanchefleur. There were nine starters. The summary is as follows:—The 1,000 Guineas stake, a subscription of 100 sovs. each, half forfeit, for three-year-old fillies, 8 st. 10 lbs. each, the owner of the second filly to receive 200 sovs. out of the stakes, and the third to save his stake; R. M. (59 subscribers):

Mr. Launde's ch. f. Apology, by Adventurer, out of Mandragora 1
Mr. Lefevre's b. f. La Courseuse, by Stockwell, out of Weatherbound 2
Lord Falmouth's b. f. Blanchefleur, by Saunterer, out of Queen Bertha 3

—Fowlers speak of a sege of herons and bitterns, a herd of swans, cranes, or curlews, a depping of sheldrakes, a spring of teals, a covert of coots, a gaggle of geese, a bade-lyne of ducks, a sord or sute of mallards, a muster of peacocks, a nye of pheasants, a bevy of quails, a congregation of plovers, a walk of snipes, a fall of woodcocks, a brood of hens, a building of rooks, a murmur of starlings, an exaltation of larks, a flight of swallows, a host of sparrows, a watch of nightingales, and a charm of goldfinches.

—John P. Moore's Sons, the celebrated gun importers and jobbers of all kinds of articles suitable for the field sportsman, have removed from their old stand to a more commodious and central location. Sportsmen visiting the city will find all the goods at their new store necessary for the gun, rifle and dog. Their address is 300 Broadway, N. Y.

—The old established house of C. Field & Co., importers and manufacturers of kid and buckskin gloves, have removed to 739 Broadway, N. Y. This house makes a specialty of leather leggings, buckskin shooting coats, and in fact will make anything necessary for the sportsman's wardrobe.

For Forest and Stream.

THE BITTER END.

TO die, with the crown of victory
In the soldiers' fainting grasp,
Is sad as the death of a fated groom
Who a widowed bride shall clasp!
But the bitterest end that Fate can send,
Is the end of an angry wasp.

J. J. B.

PARODY ON THE BEGGAR'S PETITION.

[FROM THE SPORTING MAGAZINE OF 1892.]

PITY the sorrows of a poor old mare,
Whose trembling limbs scarce keep her from the ground;
Whose wearied days are lengthen'd to despair,
For I am lame and wretchedly unsound.

Yon alehouse sign erected near the wood,
With tempting aspect drew me from the road,
To shelter there—for "entertainment good
For man and horse" was painted on the board.

Hard is the fate of the infirm and poor!
Here as I craved a handful of their hay,
An ostler drove me from the stable door,
To seek again my solitary way.

Oh! take me to yon hovel's straw-built shed,
Keen blows the wind and piercing is the cold—
Oh! spare some litter for a scanty bed,
For I am lame and miserably cold.

Should I reveal the sources of my pain,
How long I've borne oppression's direful sway,
Your hand would not withhold some little grain,
And I in humble gratitude would neigh.

Myself descended from the noblest race,
Oft from Newmarket's course the palm have borne;
Or ran the foremost in the joyful chase,
When roused to action by the sprightly horn.

Hard riding makes the stoniest horse decline;
Hard riding brought me to the state you see;
May your own horse's fate be ne'er like mine
The foal of famine and of misery.

Doom'd to draw sand, I labor'd thro' the day,
With toil oppress'd, to earn my master's bread;
Then turned adrift, this dreary waste to stray
Unheeded and unhoused, and worst of all, unfed.

Blind Dobbin, late companion of my age,
(Oft did the cruel whip his carcass flay)
Fell, stumbling fell, sad victim to blind rage,
And left the cart and cruelty to me.

Pity the sorrows of a poor old mare, &c.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

GRAYLING IN MONTANA.

WE are enabled herewith to add another important chapter to the history of the American grayling. Of the perfect accuracy of the statements there can be no doubt. The author is a surgeon in the U. S. Army (with which he has been connected since 1846), and was a medical director of the Department of Dacotah. Strange to say, he never knew of the existence of the Michigan grayling until the publication of Mr. Mather's letter in FOREST AND STREAM, which was very thoughtfully sent to him by Dr. Coues, of the Smithsonian Institution, with whom he had corresponded and talked about the Montana grayling long previous. Thus, facts are gradually being developed which we have no doubt will identify this fish as one of our familiar residents, hitherto scarcely deemed worthy of notice. Whether those of Montana and Michigan are different varieties, or whether they are identical with Richardson's *thymallus signifer* of Mackenzie's River and the 62d parallel, remains to be ascertained. We are promised additional information of the Montana fish next July, after the streams get low, subsequent to the June rise:—

The very interesting letter of Mr. Fred. Mather at page 164 of your present volume, the notice of the "Michigan Grayling" on page 168 in the same number (April 23, 1874), and the statement in your "Answers to Correspondents," March 19th, that "there are no grayling * * * in the United States, so far as has been discovered, except in Michigan," lead me to think that "What I know about grayling" may be not without interest to your readers.

In the summer of 1860 I accompanied a detachment of troops from Fort Benton, the head of navigation on the Missouri, to the Columbia River, over the route known as Mullan's Wagon Road, then just opened. All of the region traversed by this road, east of the Rocky Mountains, was then a wilderness—the discovery of gold in Montana was made some years later—and the virgin streams, uncontaminated by placer-washings, made of it a fly-fisher's paradise. In these streams, flowing southward to the Missouri, I took, beside Lewis's trout, many fish of a species which the distinguished naturalist, Dr. J. G. Cooper, who accompanied the expedition, believed to be as yet undescribed. The adipose fin indicated its relationship to the Salmonidae; and certain peculiarities—especially the large dorsal fin, recalling the drawing of Back's grayling in Richardson's "Fauna Boreali-Americana"—induced me to suggest that it was probably a *thymallus*, in which opinion Dr. Cooper concurred.

The fish in question abounds in the same waters with trout—is a much bolder biter, taking the fly readily—but makes less fight than a trout of the same size. It ranges from a quarter of a pound to a pound and a half. Of the hundreds I have taken, none, I think, exceeded the latter weight. It is known to the rustics in Montana as the "half-trout;" but sportsmen of that region have for years spoken of it as the *grayling*.

On the 9th of July last I took from Sheep Creek, a tributary of Deep Creek, which flows northward into the Missouri, some miles above the Great Falls, about seventy of these fish and perhaps a dozen trout. The mouth of Sheep Creek is about 65 miles southwest of Fort Benton, and 45 miles northeast of Helena, M. T.—as the crow flies.

A few weeks since, being enabled by the kindness of Prof. Milner to examine at the Smithsonian Institution some specimens of the Michigan grayling preserved in alcohol, I recognized at a glance my old Montana acquaintance, with a difference not at first noticed; the general form, size, scales, and the V-shaped or imperfectly crucial black spots were identical; the colors appeared to be the same; but, on closely examining the large dorsal fin, I was

surprised to find a faint tinge of red, and still more surprised to learn that in the living fish it is very marked. Nothing of the kind had ever struck me in the Montana grayling; nor have I ever seen the vivid colors so vividly described by Mr. Mather, which, did they exist in the Montana fish, it would seem impossible to have overlooked. I should never think of calling the Montana grayling a "brilliant" fish.

An effort will be made to have some specimens from Montana forwarded as soon as practicable to the Smithsonian Institution, and to obtain notes of careful observations of the colors in the freshly taken fish, a copy of which I will endeavor to send you.

Enough is already known to warrant the statement that the grayling abounds in Montana; that the species is almost certainly identical with that found in Michigan, the difference in color being possibly a sufficient ground for distinguishing it as a variety of the latter; and that it has been well known as a grayling to sportsmen on the head waters of the Missouri for ten years or more.

In every stream in which I have seen it, trout were also abundant. On the expedition of 1860, I landed together a trout and two grayling, with a cast of three flies.

J. F. HEAD.

St. Paul, Minn., May 4th, 1874.

THE MICHIGAN GREYLING.—SETH GREEN'S RECONNOISSANCE.—The following notes from Seth Green's diary have been kindly furnished us according to his promise, which our readers will join us in acknowledging with thanks:—

"I left Rochester with M. A. Green April 28th at 6 P. M.; arrived at Detroit at 6 A. M., April 29th; left Detroit by Bay City Road and arrived at Bay City at 12:30 P. M. I found D. H. Fitzhugh and Lem. Jewell, the guide, on hand; (they are the pioneers of grayling fishing on the Au Sable) with provisions and camp equipage all right. We left Bay City at 1 P. M., and arrived at Grayling, or Crawford, at 5:30 P. M.; found a good hotel kept by a Mr. Hartwick; had grayling for supper and breakfast; they were cooked to a turn; started on 30th down the river in two boats, Lem and I in one and Mr. Fitzhugh and my brother in the other; the boats are propelled with poles; Lem. is a star, with him in the stern the boat goes where he wills it. There are plenty of men that can row, but to take a boat down and up such rapids, and over and under such logs as there are in all grayling rivers, is no fool of a job, and any man that undertakes it without a Lem. will get one end of him wet before he gets far; and if he goes down the river eight miles he will walk back just eight miles and send a Lem. for his boat. All the natives that live in the neighborhood of these rivers know how to use a pole with great skill. We had proceeded down the river about two miles when I heard a splash; it was not Lem. nor myself, but one of the parties in the other boat was floundering in the water. He got out, went ashore and built a fire, got a change of clothes, and got warm, then started again. When we had arrived at the camping grounds, eight miles farther down, we had caught fifty grayling, and before our tent was fairly pitched there were some of them broiling on sticks and some in the frying pan. They are a good eating fish, but I would rather have a trout or some other kinds of fish; but I think they would satisfy the appetite of any man after a day's fishing. They have a peculiar flavor, such as I never have tasted before; the flesh is firm and coarse-grained and is free of bone as a trout's. They rise at a fly as readily as a trout and make a good fight before you land them. They take the same kind of flies that trout do; a number six hook is about the right size; but I caught them on flies tied on number four and up to number twelve. For the benefit of those that would like to know what I think the best taking colors for grayling flies, I have sent the last leader and flies I used to Andrew Clerk, 48 Maiden Lane, New York.

We slept in camp four nights, mercury ranging from 16 to 20 degrees above zero. It thawed during the middle of the day and that was the time we took grayling. We caught about sixty per day, weighing from two ounces up to one pound; they average one half pound. They commence spawning in the Au Sable April 1st and are done spawning April 12; they spawn on gravel bottom in the most rapid water. They make a hole in the gravel and cast their spawn and cover them up the same as trout do. The spawn is transparent and as large as the smallest size of brook trout spawn. I think they are about forty days in hatching. The temperature of the Au Sable is 40 degrees. It is filled with springs and I think they make it their business to cast their spawn where there are springs in the rapids. They had done spawning when I was there, but I dug 106 spawn out of the gravel and brought them home without the loss of one. I shall hatch every one of them. They are far advanced; some of them are trying to break their shell now. I took them from three different beds. There were about ten days' difference between the age of the spawn. I was disappointed when I came to dress the grayling to find they were through spawning, and to be equal to the emergency I dug enough out of the gravel to experiment with. The 106 spawn will put the country one year ahead in hatching them. I think it would be difficult to strip the spawn from them without killing the fish, but that can be overcome by using the Ainsworth screen or A. S. Collins' roller. I left the town of Grayling, May 5th, with eighty large grayling in eight twelve-gallon milk cans, and arrived at Caledonia at 11 A. M., the 6th, with the loss of one dead and two hurt so that I killed them. Mr. Collins has charge of the grayling and spawn at his Caledonia Trout Ponds. He will keep the papers posted. I found by talking with the land-lookers and trappers that there were eight rivers in which there were grayling—namely, the Au Sable, Manassee, Muskegon, Boardman, Cheboygan, Augray, Rifle, and Marquette. The Cheboygan has both grayling and brook trout. Some of the above rivers empty in Lake Huron, and some into Lake Michigan.

Some years ago Prof. Agassiz wrote a full description and drawing of the English grayling and their habits. Those found in Michigan are the same fish.

Yours,

SETH GREEN.

—We regret to learn that of the 190 grayling transported last month from Hersey River by Mr. Fred. Mather, of Honeoye Falls, N. Y., only a hundred or so remain alive. Those that died were sold to Mr. Sutherland and served at his restaurant in Liberty street some ten days ago. As to Mr. Mather's query as to whether trout and grayling inhabit the same streams, there is abundant evidence that they do.

We have seven letters from Michigan, all hastening to authenticate this fact, and from them we learn that they are found together in at least three rivers, namely, the Jordan, the Bowen, and the Boardman, all of the Grand Traverse region. We quote from one of these:—

"I have fished those waters for the last seven years, and have had very fine sport, both with grayling and trout. The grayling, for a short spurt, is much the gamiest fish of the two, but they do not hold out like a trout. They frequently, however, after being hooked spring two and even three feet out of the water. The best fly I ever found for them in June and July was a brown hackle. As to the flesh, I would not snap my fingers for choice of them and trout.

Yours,

FISHERMAN."

—It is proposed to stock the Marsh River and its tributaries in the town of Brooks, Maine, with land-locked salmon, black bass and smelts.

STOCKING THE HUDSON.

NEW YORK, May 4, 1874.

EDITOR FOREST AND STREAM:—

In common with many others, I have read the essays and remarks at the late annual meeting of the Piscicultural Association, and was pleased to learn that so much has already been done to increase the supply of fish to say nothing of the hopes of achieving much more. But, after all, the public estimates the importance of all projects by their practical results, and so (interesting as may be the history of success in raising speckled trout, grayling and other small game fish) the *oi polloi* are eager only for the introduction of large food fish to our waters and tables. Beyond the circle of anglers of which I am glad to count myself one, it is hard to interest the general public in such things as fly-fishing and the stocking of preserves. And thus we are brought to the subject of the introduction of shad and salmon.

We know already what has been done in shad culture, and trust that our Fish Commissioners may succeed in procuring laws for a proper "close time." There is no other reason why one hundred million shad fry should not be annually placed in the Hudson and other rivers of our State, instead of five or ten million as now.

We are not fully informed as to the progress made by our commissioners in the introduction of salmon, but I fear they have allowed themselves to be deterred by seeming obstacles from attempting this experiment on a scale commensurate with its importance. I trust that Mr. Roosevelt and his confreres in authority will accept all the California and Penobscot salmon eggs and fry which Mr. Baird can furnish, and place them in a dozen of the numerous suitable streams running into the Hudson between Glenn's Falls and Troy. The Boreas, Anasable, Saranac and many rivers running into Lakes Champlain and Ontario might have a few thousand placed in them; but for purposes of commerce and industry I regard the Hudson as the important point. The only obstacle is the dam above Troy; but as every salmon fisherman knows, this is hardly an obstacle, and can be easily remedied in time for the return of the salmon to the place of their birth two or three years hence. On freshet the salmon could run up this dam as it now is, and the cost of a fish way would not be great. Considerable inquiry in Canada as to the value of fishways introduced there of late years has convinced me that these devices have met the decided approbation of salmon, as evidenced by the use of the facilities thus afforded on many streams where their passage to the headwaters had been obstructed by dams for, in some cases, thirty years.

I trust that our Fish Commissioners will stock the Hudson with all the salmon fry they can get, and continue to do so annually. It does seem to me so important that the free offer of salmon fry by Mr. Baird should be availed of, that I hope our journals may take up the subject. Never has an opportunity of establishing a new industry so cheaply and on so large a scale been offered. Let us embrace the chance, and there is no reason why our Hudson River fisheries should not become more important than the take of our shad seiners.

The introduction of salmon also into our inland lakes would be an interesting experiment. Cut off from the sea, I think the result would be the production of something like a Schoodic or land-locked salmon, the gamest fish of its size that swims. But the Hudson River is the important point, and now is the time to begin. This season should not be lost. I understand that Mr. Slack has still many thousands of young California salmon fry to distribute.

MANHATTAN.

AS TO LOBSTERS.

ROCHESTER, N. Y., April 28, 1874.

EDITOR FOREST AND STREAM:—

I wrote the lobster article to set the people to thinking and experimenting, and I am sure that it will be the means of making lobster culture a great and thriving business in a very few years. I am sure it can be done, and if it cannot it will not be many generations before they will become extinct. I believe they have a certain season for spawning, and that if they were put in any small body of water near the large body of water that they were taken from and only a small neck of low land between their large natural water and the small place of confinement, that they will walk over. They will surely, if they can walk on land. I know the fresh water lobster can and would. There are but few people that know anything of the great reasoning and instinctive knowledge of dumb animals.

SETH GREEN.

WINCHESTER, Va., May, 1874.

EDITOR FOREST AND STREAM:—

I am sorry to inform you that the Virginia Legislature has again failed to make an appropriation for the furtherance of her fishery interests. The bill passed the House but was defeated in the Senate by a small majority. This untoward result has been owing partly, no doubt, to the lamentable condition of the State finances, but mainly, I fear, to culpable ignorance of the importance of the subject on the part of many of our "legislators, so called," as Bill Arp would say. However, the friends of the fish will keep "pegging away" until we achieve our ends.

Yours truly,

A. WALL.

Natural History.

DO QUAIL WITHOLD THEIR SCENT?

EDITOR FOREST AND STREAM:—

I have shot quail for years, shot thousands of them, and tried my best to find out if they do, but I don't know. E. S. Wainmaker says that "a wet bird, or a dead one, a running bird, or a wounded one, a good dog will readily find." I have never yet seen the dog that could smell a live quail three feet when there had been a brisk rain falling long enough to give the birds and their cover a good wetting. I have shot over dogs that had no trouble in trailing them before they were flushed, and the same dog utterly failed to do it after they had been flushed, particularly if the birds had run over dead leaves. I have seen dogs point single quail (closely hid and of course badly frightened) from one to two rods distant, and have seen the same dog go within a foot of one that had just been shot dead and not smell it. As to smelling a wounded one, no dog has any trouble there, and I positively believe that at least one dog I know can tell by the scent whether a bird is wounded in the wing or not, as he invariably goes for a winged one the moment he scents it, but points one wounded in the leg or body just as firmly as a sound one. It is generally impossible for the dog to scent quail just

after they have been frightened by a hawk. This seems to confirm the theory that they do withhold their scent, and that they do it involuntarily as the hawk does not pursue by scent.

By the way, sportsmen, kill every hawk you can. When you see one, crouch closely to the ground and give a few calls in imitation of the quail, and he will generally come within shooting distance. O. H. H.

THE WAY I CAUGHT THE MINK.

EDITOR FOREST AND STREAM:—

In the fall of 1873 I took my lines and went on a sort of hunting and fishing excursion to Lake Winnepissiogee. It was one of those calm, sunny days in November, denominated weather-breeders, when, with my skates firmly strapped on my feet, I was skimming on the ice in the direction of a group of islands known as the Forty. Leaving Birch, Huckleberry and Cow Island behind, I soon gained the Forty, and after a skate round among them concluded to cut some holes and try my luck for pickerel and cusk. The ice was about three inches thick and clear as glass. I cut five holes and fished away awhile, but had no bite. It being dull music I thought of taking a look around the shore of one of the islands, the larger of the group, upon which is a low cabin used as a place where fishermen stop over night. At the cabin we seated ourselves on one of the rude benches and eat our lunch, read the names inscribed on the walls, then took our way once more for our lines. As we neared the shore we saw a splendid mink by the side of one of the fish holes busily engaged eating our bait. Carefully picking up a stick I made for him on the double-quick. Instead of attempting to get by me and gain the shore, he dove right down into my fish hole and began to swim off under the ice. I ran along, and presently he stopped and put his nose up against the ice and let his breath go out that made a large bubble, and this he again breathed in and swam again, not so far as at first, and went through the same performance, the bubble not near as large as the first; for three times more he did the same, each time being shorter, when he stopped under the ice and began to carp and act like a cat when strangulating. I waited until he was perfectly quiet, when I cut a hole through the ice and took him out. He was in prime condition, and fearing he might come to life and be off, I hastened to the shore and in a few minutes had his jacket stripped off, and depositing it in the profound depths of my coat pocket, went at fishing in earnest. When the shades of evening began to draw down over nature and hide from my view all lesser objects, I could still see looming up far to the north old Ossipee Mountain, where I had whiled away so many happy hours rambling amid its wild defiles. At the south was Gunstock Mountain, its base seeming to rise from the waters of the lake. My fish, of which I had five pickerel and two cusks, seemed to weigh fifty pounds, and I was really glad when my house was gained, and I also entered on my note book a new idea relative to mink life and how they can swim for some distance under the ice. It seemed strange that he did not attempt to come back to the fish hole. But I opine he had forgotten the direction, and hence swam off into deep water. J. L. H.

THE CRESTED FLY-CATCHER.

NASSAU, Rensselaer county, N. Y., May 4, 1874.

EDITOR FOREST AND STREAM:—

At your request I send you a few notes on the great crested Fly-catcher (*Migicarchus crinitus*), which will be interesting to some of the readers of your excellent paper. The vicinity of this place, for reasons unaccountable to me, is a favorite breeding place for this rare bird.

The great crested Fly-catcher arrives here at about the 20th of May. It is remarkably regular as to time of arrival, nearly all arriving at the same time. Upon their arrival a favorable place is chosen, which is usually an orchard with a grove of trees not far distant. Low ground seems to be preferred to the higher localities. In this selected place the bird, after finding a mate, spends the season, not more than one pair occupying the same place. Although it is spoken of as being a quarrelsome bird, I have never seen it engaged in a fight. It is of rather shy disposition as compared with the other fly-catchers, although it is found near the farm houses. It is a very lively bird and very industrious in its search for food. You see it in the top of a tall tree, on a sprout near the ground, and again flitting to another tree, all in the same instant. Its food, which consists of insects which are caught flying, is seized with a loud snap of the bill. The notes are of two different kinds, the most common resembles the syllables T-r-i-p, T-r-i-p, T-r-i-p, which are uttered in a very distinct voice, a rolling sound being given to the r. This note is uttered immediately after the bird alights, after darting after an insect, at which time also it frequently flits its tail in the manner of the other fly-catchers. The other note is a single syllable very much resembling the last syllable of that of the common quail, and is uttered in a loud, clear and distinct voice. This note is uttered at intervals of two or three minutes. On the first week in June the nest is commenced. This species is remarkably regular in its time of nesting. All the birds of the species in the vicinity nest at almost exactly the same time. The nest is placed in a hole in a tree, usually in an orchard near the chosen grove, at an average height of about 10 or 12 feet from the ground, although in one case I found the nest at least 30 feet from the ground, and have found it as low as four feet. One instance came to my knowledge last year of a nest being built in a bluebird's box, about fifty feet from a farmhouse and near a walk by which the occupants of the house were frequently passing, and notwithstanding its rather shy disposition, the female laid and hatched four eggs. The nest of this species has been so often described that it is useless for me to do so here, as I find that descriptions of it agree. The average number of eggs is five. I have found six in two cases and four in one, finding five in the majority of the nests. I think that both birds incubate, but both sexes being so nearly alike in color it is difficult to ascertain. On approaching the nest the setting bird flies quietly off and immediately commences catching insects and uttering its notes, seemingly in a very unconcerned manner. The birds are very much attached to the nest, and if all the eggs are taken but one the parents will continue to sit until that is hatched. After the young are hatched the parents are quiet, and the only note uttered from them till the time of departure for the South is the single note, and that not very frequently. After the young are fully fledged they separate, and only the parents continue in the vicinity of the nest. This species commences its journey south about the third week in September. None are seen here after the first frost. R. T. MORRIS.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, May 10, 1874.

Animals received at Central Park Menagerie for the week ending May 9, 1874:

One Night Heron, *Nyctiardea gardeni*. Presented by Mr. F. S. Webster of Troy.

Three Green Turtles, *Chelone viridis*. Hab. West Indies. Presented by Master Wm. J. Halstead.

One Quail, *Ortyx virginianus*. Presented by Miss Kate Heiter.

One black-necked Swan, *Cygnus nigricollis*. Hab. Peru.

Two Spotted Hyenas, *Hyena crocuta*, born period of gestation 16 weeks. They are of a uniformly black color, no indication of spots; born with eyes open. W. A. CONKLIN.

A CURIOSITY.—Mr. Asher P. Cole has shown us a trout with two heads, two sets of gills, four eyes, two mouths and but one body. The heads unite just back of the gills. Each head runs independently of the other. If meat be placed in front of the creature, both heads go for it. Both mouths take food at the same time. All the gills are in working order. The trout seems as lively and healthy as its brethren.—*Wellsville (Ill.) Reporter*.

[Rather tough—but better two heads than none.—Ed.]

Woodland, Lawn and Garden.

BIENNIALS, PERENNIALS, AND TENDER PLANTS FOR THE GARDEN.

TAKING up this subject where we last left it, we ask how shall we dispose of this elegant but very tender plant we hold beneath our trowel? And to understand fully what is a tender plant is very necessary to every lady gardener, as well as skilful cultivator. Very many of the annuals we have shown will grow freely in the northeastern States in the ground, and in our open summers.

To fully understand the term *tender*, you will conceive a plant which does not usually attain full perfection by the ordinary mode of outdoor cultivation; such plants as require to be grown in pots in the green house. Among such plants we place the globe amaranth, balsams, and the egg plant. All such tender annuals may be classed as half hardy annuals, and can be well grown as such.

Without our biennials and perennials we could not well get along with our city gardens. They only require a few judiciously selected plants, to be sure, but then these plants are to give you much joy or little satisfaction, according as they are well or illy selected. These showy plants you will usually place within the border (they are well adapted for this kind of grouping), as they unfold their rich and varied blossoms of scarlet and gold both early and late in the season. They are by no means to be neglected, and should be reckoned among the flowers as indispensable. Florists reckon them as the most showy permanent decorations of the city flower garden.

No garden is complete without the larkspur, phlox, three kinds; lychnis, corcopsis, saxifrage, etc. These plants you can place in groups in almost any situation with good effect. Biennials are such plants as yield their blossoms on the second year, and after their blossoming comes death. Of these plants we may classify many varieties, which, with an ordinary amount of care bestowed upon them, will give a delightful parterre of flowers at a very trifling cost. In this class of flowers you may place, as among the most desirable, the best varieties of digitalis, of which there are five varieties, and all are very beautiful. We have raised from the seeds some remarkably fine specimens of this plant, and would say to our lady friends, sow this very spring a liberal amount of the seed of the digitalis, and the plants will grow finely until autumn, when a slight protection for the winter of strawy manure will give you in the spring a fine plot of these always reliable flowers. From this spring's sowing you will have next summer, perhaps, digitalis of four or five different colors. The pure white is a fine specimen flower, and we have noticed that seed saved from the whites always reproduce themselves in the most perfect manner.

As our object in these sketches is to instruct as well as to amuse—to give to our lady friends, lovers of fine flowers, a reliable formula upon which to base their labors, they will understand that very many of our finest flowers of today are from the improved culture bestowed upon our old varieties. Therefore you are to endeavor to reproduce your own seeds for the future from the best varieties of plants you can procure. Get the best seeds you can; begin, say, with the zinnia, a plant of easy culture, and try and improve this flower by saving the seed flowers of the last plants. Tie these up and place in paper bags, upon which is written a whole history of your floral work so far as relates to this flower, and so on through all your experiments. Our word for it, this is our own mode of doing these "little experimental chores," and they always have paid us well in the end.

Next in your selection we mention that old favorite in every garden, known as the canterbury bell, and in this you have also a reliable flower. The sweet williams, hollyhocks, and their kindred are also of the kinds from which you should propagate and save your seed. Remember that you may fortunately raise a variety that will repay you fourfold for your labor, and hand your name down to posterity as the originator of such a very desirable and valuable addition to the floral kingdom.

In the autumn sowing of these seeds you can for convenience use what is called a cold frame, the many valuable uses of which we shall inform you in the proper time and place.

What is called a "florist's flower garden" you should now be told, and also of some of the benefits arising from a good collection of flowers grown by yourself, as you are now supposed to "go alone," and lean less and less upon the staff of the floriculturist. Strictly speaking, the florist's flower garden has been composed of the following flowers:—Dahlia, in varieties; hollyhock, ditto; chrysanthemums, ditto; tulip, many varieties, large and small; polyanthus, auricula, heartsease, ranunculus, varieties; anemone, carnation, pink, variety; pickotee, and hyacinth, and to these old well known standards of the garden you may if you choose add such others as you can find time to take good care of. We however would counsel you not to lay out too much work for yourself just in this place. We are well aware that a good, bright, warm April day puts new life into almost every one, and we, like all our friends who love flowers, are filled with new fancies, new delights, and desires after the beautiful gems of earth. But let us stop here for a moment and think over what we have already done, and what we necessarily have yet to do, before we lay out more garden work for the future.

Now, a florist's bed means a place from which to draw your duplicated flowers, if necessary, in pots or otherwise,

for selling or setting out, and your bed should be constructed so as to be as convenient for this purpose as possible. A rough structure, made with boards, will often afford you ample means of multiplying and keeping your plants on hand through the winter. A good dry cellar, with considerable light from windows on the south side, can in ordinary instances be converted into a very good and cheap cold house. If your cellar is located under your barn you can make your fall beds for the keeping of your auriculas, polyanthus, carnation, and flowers of that ilk grown in pots in this manner. Place about six inches in depth of good clean coal ashes upon such an area of surface as you desire to use for your small or large collection of plants on the bottom of the cellar, of an oblong form. Over this you can raise your platform of tiles, or in absence of tiles use plank one and a half inches thick and fourteen inches in width. Over these you can raise your shelves of bricks at regular distances to support your pots. After you have potted off your plants in the fall, you will place them aside for the present while you attend to another department of your garden operations. Potting of these plants for next year's use should be done in May, and then committed to the cold house to rest for the present. Such plants as of necessity remain out over winter, as the bulbs of the tulip, the lillium, etc., may be safely protected by a thin coating of leaves and strawy manure, which should be removed in the early days of April.

In our next we shall give the results of our own experience in the culture of specialties, and directions to amateurs as well as our lady culturists.

OLLIPOD QUILL.

SEASONABLE HINTS ABOUT PLANTING.

Kitchen Garden.—Such of the hardier vegetables as were sown last month will now be growing, and should be kept free from weeds, and, as soon as large enough, thinned. In most localities all the varieties of vegetable, except perhaps tomatoes and egg plants, may be planted in the open ground now.

Asparagus.—Do not cut until the plants are two years old, and if they can be left until three all the better for the future of the bed. Set new beds now.

Beans.—Do not plant until all danger from frost is over; then plant in rows three feet apart. Limas started on sods under glass may be set out when cool nights are over; and when the ground becomes dry and warm seeds may be put in.

Beets.—Thin out the early plantings and keep carefully hoed; the thinnings make greens, preferred by many to spinach. Plant for a succession.

Cabbages, broccoli, cauliflower, etc., all need the same general treatment when young. Set out early plants from the hot bed or frame, and keep well hoed. Sow for late crops in the open ground.

Carrots.—Sow the main crop when the soil is warm, and keep clean from the start, or the weeds will soon exceed the carrots in size, and the crop be injured.

Celery.—Sow seeds, if not already done, in open ground.

Corn.—Plant as soon as all danger of frost is over in drills three and a quarter to four feet apart. Plant every week or ten days for a succession.

Cucumbers.—Plants started on pieces of sod may be set in the open ground and covered at night with frame or even a paper to prevent their becoming chilled. Sow seeds in open ground as soon as warm, and dust the plants when up with plaster or ashes to prevent the "bugs" from working on them.

Egg Plants.—Do not set out until cool nights are over, and the ground becomes thoroughly warm; then set in rich soil two feet apart each way.

Lettuce.—Keep the soil around early set plants loose and free from weeds. Set out new beds and sow seed for a later crop.

Melons require the same treatment as cucumbers. When growing well give liquid manure once or twice a week.

Onions should have been sown last month to insure a good crop. Weed as soon as up and keep the soil stirred often. Ashes worked in between the rows, and worked in with a hoe, and a dressing of salt are beneficial.

Parsley.—Soak the seed in warm water, and sow in open ground, patting down the earth well.

Peas.—Bush before they fall over. Earth up a little when hoeing. Plant late sorts in rows four to five inches deep, so that they will not dry out during warm weather.

Potatoes.—Finish planting for general crop, and hoe the early sorts as soon as up. Just before the potatoes appear above ground draw a harrow over the rows; this will destroy numerous weeds.

Radishes.—Sow every week for a succession, and keep clear of weeds.

Parsnips.—The earlier these are grown the better the crop is likely to be. Use only last year's seed. Hoe and seed as soon as the plants appear.

Rhubarb.—Do not gather from plants set last year. Cut off all flower stalks as soon as they appear.

Squashes for late use should be planted by the middle of the month in rich soil. Treat the early sorts the same as cucumbers.

Tomatoes.—Transplant as soon as warm enough to the open ground, setting the plants four feet apart.

Turnips.—Dust air-slaked lime or ashes on the young plants as soon as up to destroy the black fly which attacks them.

Flower garden and lawn planting will form the main work in this department for the first part of this month. Evergreens succeed best when planted some time during the month. Great care must be used not to allow the roots to dry by exposure to the winds, as when this happens the tree seldom survives. Set out ornamental trees at once before they commence their growth. If any trees need moving attend to it at once.

Lawns.—Clear up all dead leaves, sticks, etc., if not done before. The lawn should be cut often in order to keep the surface neat and smooth. If the grass is not too thick allow it to remain on the ground; it will serve as a fertilizer, and also prevent the sun from drying out the roots.

Shrubs.—A selection of early flowering shrubs will give a place an attractive appearance in spring before the leaves have started on the ornamental trees. Shrubs flower better if properly pruned.

Edgings around beds and walks should be kept neatly cut, and no grass or weeds allowed to grow on the paths.

Paths.—If any new paths or drives are needed make at once, and use plenty of broken stone as a foundation, and finish with gravel.

Annuals.—Sow as soon as the ground becomes warm—at least by the middle of the month. Keep the beds clear of weeds.

Perennials should be sown in a separate bed from the annuals. Sow seed of those now coming into flower as soon as ripe.

Bulbs.—Set out gladiolus, tiger-flower, and lily bulbs in rich soil. Tuberoses do best if planted in pots and started in the house before setting out.

Climbers.—Sow seeds of sweet pea, cypress vine, morning glory, etc., where a screen is needed and for covering trellises.

Dahlias started in the house may be planted out now, and as soon as they commence their growth they must be tied to stakes.

Do not put all the greenhouse plants out of doors, as is sometimes done, but keep the house looking well the year round. This can easily be done if a little pains is taken with shading.—*American Agriculturist*.

The Kennel.

THE ENGLISH FIELD TRIAL CONTROVERSY AND INTERNATIONAL POINTER AND SETTER CHALLENGE.

WE publish the following letter at the request of the Rev. J. Cumming Macdonald. At the same time we know nothing of the merits of the case beyond what we have read in our various sporting contemporaries, nor can we interfere or be the medium for printing any disputes that may arise among sportsmen on the other side of the water. Mr. Macdonald is mistaken when he states that we refused to print it on the ground that it would give our friends here a wrong impression of the high-toned English sportsman, and most likely prove prejudicial to the interests we advocate. We must most respectfully decline to print any more correspondence on this matter, which has been so thoroughly ventilated by the English press.

The latter portion of Mr. Macdonald's letter will be found extremely interesting, owing to the liberality and hospitality of the challenge. The Rector, with the consent of the Kennel Club of England, is using his utmost endeavors in the interest of true sport to revive the International Field Trial Match between English and American bred pointers and setters. We fear, however, that it will be impossible for us to induce any of our field sportsmen to take their dogs over to England *first*; for reasons we have frequently given in this journal:

To repeat, 1st. The debatable theory as to the voyage injuring the nose or scent of the dog.

2d. At English Field Trials they allow no points for retrieving, which would be one of our strongest points.

3d. The superiority of the English professional dog-breaker, as most of our animals are trained by the owners.

4th. As we have had no field trials at present, except some informality over snipe at Pine Brook, where most of the dogs that entered had been trained and broken, it would be impossible to select representative dogs of America, as almost every field sportsman owning a pointer or setter very naturally thinks that he has the best dog. If any gentleman thinks there is a chance for his dogs to win or make a good show in England, this would be a good opportunity to test his pluck and the merits of his animals. The Rector of Cheddle is evidently so much in earnest to bring about a field trial contest between American and English dogs, that he has authorized us to state that provisions have been made by him for two passages and accommodation for two or more brace of dogs providing the American sportsman will consent to go to England.

That the English bred dogs, as a class, are superior for nose, staunchness, ranging, and retrieving in the field, we beg leave to dispute. That they may be better under the command of the English handler or worker, we are inclined to admit. If Mr. G. Macdonald, who is now the owner of the Rector's kennel of dogs, and who is well acquainted with our country and its field sportsmen, will kindly consent to bring over here *first* a brace or two of pointers and setters, so as to initiate us in the laws and usage in practice at English field trials, we will guarantee to find him a number of gentlemen who will enter their dogs in a sweepstake field trial, over quail in the buckwheat and bush, or pinated grouse in the open or prairie:—

HILBRE HOUSE, WEST KIRBY,
CHESHIRE, Eng.

EDITOR FOREST AND STREAM:—

Your leading article of February 7th upon the International Dog Trial has only been brought under my notice to-day. I am sure you are in the true interest of sport, that nothing but an upright and honorable course should be adopted in the matter of this match; and as most flagrant misrepresentations have been made to you in Mr. Llewellyn's and his breaker's letters, I venture to send you a few lines in reply. Readers of the *Field* newspaper (our highest authority upon field sports in England) know well that every effort on my part was made to bring Mr. Llewellyn to "the scratch," and to arrange for a field trial between us. The Marquis of Huntley most kindly placed his estate at Aboyne, in Scotland, at my disposal for the match, to come off in the second week of August next, and kindly consented to act as judge in my behalf. I offered to refer the arrangement of the details to the Kennel Club of England (of which H. R. H. Prince of Wales is Patron). This Mr. Llewellyn declined. I then named five gentlemen of well known standing in the sporting world. He refused also to accept their decisions; but having selected one out of the number to act on his behalf, I wrote and informed him that I was prepared to name my brace, and gave him a week to name his. I had no reply and concluded he would not go on with it, so I mated the dogs. The correspondence was sent to *Bell's Life* last week, to which I refer your readers. One word more about this *arcade* *ambo*, Mr. Llewellyn and his breaker. The real source of their chagrin and peevishness is their having been beaten in the field so often by Mr.

Price and myself. *hinc illæ lacrymæ*. "Belle" and "Ranger" have beaten all the cracks. Mr. Llewellyn cannot forgive me for so often beating him, nor for having bred so many grand setters and pointers, winners at field trials and on the show bench. He is indebted to Mr. Laverack, Mr. Statter and myself for all the good he has in his kennel. It was I that sold him Plunket for £150 sterling. He bought Countess and Nellie from Mr. Laverack and Dick and Dan from Mr. Statter, and with all that a long purse can do for a man he has not yet been able to face us in the field with dogs of his own breeding. This is where the shoe pinches. Since I sold him Plunket I have beaten him at the Maynoe Field Trial with a young Irish setter bitch, "Music," who was first in the puppy stakes 1872. Since then I gave him a crushing defeat at the great trials on grouse, at the Bala Field Trials last August, with my world-renowned setter dog Ranger, bred by myself. This was too great a sin to be forgiven, hence his long letters of grumbling and snarling *ad nauseam* to the papers, until the public were sick of them, and the *Field* refused to insert any more. The letter of his breaker, Buckle, which you published, is nothing short of a gross insult to the dignity of the press, both in Europe and America. The covert sneer and insult conveyed by the words "Mr. Price knows hospitality will serve where a bribe would be rejected with scorn, and so he invited the reporters of the sporting papers to his houses" is beneath contempt, knowing the source from whence it came. It is perfectly true that Mr. Lloyd Price, in the exercise of that princely hospitality which as squire of half the county of Merionethshire, he could so well dispense, invited the chief editor of the *Field* and other members of the press as gentlemen and sportsmen, to be his guests at his house during the field trials. That gentlemen of their position and character and representing papers of the greatest importance and respectability should be charged with such a gross breach of the conventional rules of the Fourth Estate, is, I contend, not only an unpardonable insult to our press here, but that you should be requested to publish so great a libel, is an insult to the press of America.

I am still sanguine that American sportsmen will accept our challenge in the spirit in which it was made, to send over to us two brace of dogs next August to run against dogs named by our kennel clubs. I have made arrangements with Messrs. Guion & Co. of the well known line of Guion steamers between New York and Liverpool, to secure two first-class passages for two sportsmen, selected to represent America; also accommodation for two brace of dogs. We will return the compliment and visit you next year with our dogs. In the meantime you and American gentlemen may rely upon our honor to treat your representatives with all the fairness, hospitality and courtesy in our power to extend.

J. CUMMING MACDONALD.

P. S.—In Mr. Laverack's letter to you he makes a mistake when he states "Ranger has three-fourths Laverack blood in him." Mr. Laverack, like myself and other large breeders, relies upon his own judgment in the selection of different crosses to keep up our peculiar strain. I yield to no one—not even to Mr. Laverack—the pre-eminence. The Macdonald setter has won and is bound to win in any trial where great speed, capital nose and lasting endurance is to be obtained. I adjoint a correct pedigree of Ranger. This letter must be considered a final answer to Mr. Llewellyn.

SNAKE-BITTEN DOGS.

JACKSON, Miss., May 8, 1874.

EDITOR FOREST AND STREAM:—

Never having seen anything published in regard to proper treatment of a dog bitten by a venomous snake, to elicit the same I give you my experience below, and would like for your hunter naturalists to give reasons why it is that a dog, being bitten by a venomous snake, never or very rarely dies. So, at least, I am assured by reliable parties, they not having recourse to any remedy whatever, but simply let the dog alone.

The incident which causes this letter occurred March 3d, my last hunt of the season. We had hunted the whole morning, bagging a few snipe, but finding only one small covey of partridges in the woods. After luncheon we rode into a large field bordered by a strip of bottom land; through this ran a rivulet into which emptied a drain overgrown with briars out of the field. It was on this drain my dog Dash came to a stand. Riding back some distance to a sapling to tie my horse, the covey flushed, though Dash was fully twenty yards from them and had stopped where I had cautioned him to "head" when riding away from him. Only two birds of that covey were flushed on the drain, the balance had scattered along the rivulet, which I was about to jump as Dash was on the other side, when my companion called my attention to an immense number of tadpoles in a hole of the little watercourse. That delay saved me from being bitten, for Dash had come to a point at a thick clump of sedgegrass; not a steady point, but the action that is usual with him when he first winds game. He slightly wags his tail. As I jumped across to kick up the supposed bird, Dash gave a yelp and made a backward spring, falling in doing so. My first impression was that a wasp of some kind had stung him. I was quickly undeceived, my friend shooting the aggressor, a water moccasin about thirty inches in length, as he tried to make his escape, gliding out of the grass into the water. The serpent was nearly shot in two, but showed us he was ready for battle yet, so wounded we left him. Then I looked at Dash. Two tiny streams of blood were running from just back of his nose; the hemorrhage soon ceased, the wounds being closed by an excessive swelling which spread over the whole head and lower part of the neck, the latter being the last to subside. The swelling increased rapidly, with a yellow foam, assuming at one time a vivid green color, running both from mouth and nostrils, the dog meanwhile seemed barely able to keep his legs, had a sleepy look, head hanging listlessly, with inclination to lie down, and it seemed as if he would have given up but for my voice encouraging him, not only to follow us, but keep up with our horses.

The remedy was the next thing; whisky, that old reputed antidote against snake bites we did not have with us, nor had they any at the next farmhouse, but they produced some saleratus on my friend's inquiry, which he plastered on the wounds and gave him a tablespoonful dissolved in water internally. I was willing to have anything done in the hope of relieving my four-footed companion. On reaching town one of our resident physicians, whom we met, told me to use aromatic spirits of ammonia on the wounds and to give a small dose internally; the aromatic because the application had to be made so near the nostrils. The swelling reached its maximum the following day, but had not entirely subsided in a week. The dog kept his kennel for several days, coming out only to eat. He now seems to be as well as ever.

Now what is there in a dog to counteract the poison of a serpent like the moccasin, whose bite is supposed to be of a deadly nature? Fat can not come in in this case, for my puppy was bitten in a place where there is the least amount of fat; veins must have been struck by the fangs of the snake to judge by the profuse hemorrhage.

In conclusion, I would ask you why Fred Beverly, in his very interesting account of his travels in Florida, uses the word "hammock," where I think he means "hummock?"

GEO. C. E.

[1. Possibly Professor Goode, of the Smithsonian, who is well read on "snails," can solve the problem. 2. "Hammock" is the word in use in Florida.—Ed.]

—M. Francois Ubassy has challenged Albert Garnier to play him a match game of billiards of 1,000 points up for \$500 aside, according to the champion cup rules. He wishes the contest to come off as soon as possible, as he intends sailing for Europe at an early date.

Rational Pastimes.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

—On May 5th the championship season was opened upon the Union Grounds, Brooklyn, the first contest being between the Atlantic and Baltimore clubs. It rained in the morning, and the patrons of the game thinking no contest could take place did not go over. But the Baltimoreans began play with their opponents at 4:20 P. M., and the Atlantics opened their batteries on the veterans with such effect that the close of the seventh inning saw the "Canaries" nearly dead birds by the score of 24 to 3, a worse defeat than they had sustained at the hands of the Philadelphians the day before. The next day the Baltimoreans encountered the Mutuals on the same field, the ground being in good condition and about a thousand people present, which number would have been more than doubled had the tariff been in accordance with the times, and 25 cents instead of half a dollar. On this occasion the Mutuals found it difficult to defeat the Baltimoreans, as the appended score shows:—

Mutuals—0 0 1 1 3 1 1 0 1—8

Baltimore—0 1 0 2 0 0 0 1 1—5

Umpire, Dehlman. Time 2:40. Earned runs, Mutuals 3, Baltimore 1.

On May 8th the Athletics visited Brooklyn for the first time this season, and played a model game with the Atlantics, the contest occupying but an hour and a half, and being played with but two errors on the Athletic side and seven on the part of the Atlantics. The score of runs each inning was as follows:—

Atlantic—0 0 0 0 2 0 0 0 0—2

Athletic—0 0 0 0 2 1 0 2 0—5

Umpire, Coney. Earned runs, 2 to 2.

The Mutual and Athletic game of the day following was in striking contrast to this match, the gentlemanly deportment and quiet earnest play of the Atlantic and Athletic match being offset by a regular old-time growling and fault-finding contest between the Mutuals and Athletics. The game, too, occupied nearly three hours. It was given away almost in the first two innings by the errors the Athletics committed. The score of runs each inning shows the play:—

Mutual—3 1 0 0 2 0 0 2 0—8

Athletic—0 0 0 0 3 0 1 0 1—5

Umpire, Dehlman. Earned runs, Mutual 6, Athletic 1.

The above were the local professional games of the week.

—A singular game was played on May 6th, on which occasion the amateur Fly Aways caught the Atlantics napping and defeated the professionals at the Capitoline Grounds by 12 to 11. The Atlantics had the game in their hands in the ninth innings by a score of 11 to 6, but as the Fly Aways had the last innings, the latter got in six runs on one base but could not win the game, important errors by Pearce, Ferguson and Chapman losing them the game.

—Out of town last week the Bostons defeated the Baltimoreans by 14 to 0 and 28 to 7. The Hartford also beat the Baltimoreans badly, and the Athletics the Philadelphians, the latter by 7 to 1. The full record of professional games from May 5 to May 10 is as follows:—

May 5—Atlantic vs. Baltimore, at Brooklyn, 24 to 3.

May 5—Hartford vs. Athletic, at Hartford, 10 to 9.

May 6—Mutuals vs. Baltimore, at Brooklyn, 8 to 5.

May 6—Boston vs. Athletic, at Boston, 10 to 4.

May 6—Hartford vs. Yale, at New Haven, 6 to 4.

May 6—Chicago vs. St. Louis Red Stockings, at Chicago, 14 to 7.

May 6—Philadelphia vs. Eureka, at Philadelphia, 17 to 8.

May 7—Fly Aways vs. Atlantic, at Brooklyn, 12 to 11.

May 7—Hartford vs. Baltimore, at Hartford, 21 to 2.

May 7—Athletic vs. Philadelphia, at Philadelphia, 7 to 1.

May 7—Alert vs. Arlington, at South Orange, 27 to 7.

May 7—Chicago vs. Red Stockings, at Chicago, 26 to 1.

May 8—Chicago vs. Red Stockings, at Chicago, 8 to 3.

May 8—Athletic vs. Atlantic, at Brooklyn, 5 to 2.

May 8—Boston vs. Baltimore, at Boston, 14 to 0.

May 8—Philadelphia vs. Princeton College at Princeton, 15 to 7.

May 9—Boston vs. Baltimore, at Boston, 28 to 7.

May 9—Mutual vs. Athletic, at Brooklyn, 8 to 5.

May 9—Hartford vs. Trinity College, at Hartford, 27 to 2.

May 9—Philadelphia vs. Collins, at Philadelphia, 23 to 0.

—The Nameless amateurs of Brooklyn went to New Brunswick on May 9th and were cordially received by the students of Rutgers College, who took them out on their field and tried to show them how to play base ball, but the Brooklyn youths had been there so often before that they turned the tables on the college youths, and taught their hosts a lesson to the tune of 17 to 4. The score was as follows:

Nameless—2 2 2 6 1 0 3 1 0—17.

Rutgers—3 0 0 1 0 0 0 0 0—4.

The New York Fly Aways the same day took a trip Eastward to show the Yales how they beat the Atlantics. The collegians met them at Hamilton Park, New Haven, and kindly cared for the Yorkers, and finally took them into camp by a score of 15 to 5. The Fly Aways returned to town very quietly, and since then Malone has not been seen. At any rate no report of the defeat appeared in any of the local journals.

—On Saturday the Nassau club of Brooklyn defeated the Rosedales at Prospect Park by a score of 13 to 5. A good game.

—The St. George's Cricket Club opened the season by playing a match on their grounds at Hoboken yesterday. The Union Club of Philadelphia will play a match with the St. George's on the 20th and 21st of May on the grounds of the latter club.

—We are requested by Mr. Satherthwait and several members of the St. George Cricket Club of New York to publish the following:

All cricketers in the United States and Canada are hereby cautioned against a person calling himself Henry Temple, but whose real name is Billington. He was captain of the St. Louis Eleven that visited Canada and Eastern States last fall, and in this way became acquainted with many prominent cricketers.

During the month of March he succeeded in swindling

various cricketers in this city, Boston and Chicago, by producing letters of credit purporting to have been issued by respectable firms in St. Louis. He is well educated, and having very plausible manners, is a dangerous swindler.

He is about thirty-two years of age, six feet tall, stoutly built, has fair hair, is round shouldered, and is slightly lame; anyone hearing of his whereabouts is requested to communicate with the Secretaries of the Boston Cricket Club of Boston, and the St. George's Cricket Club, New York, P. O. Box 922.

A number of amateur matches were played in Boston and vicinity May 9th. One between the Harvard University nine and the Chelseas was won by the collegians by a score of 18 to 8. The Harvard nine has procured its new uniform, which, in looks, is a decided improvement on that worn last year. The Uticas defeated the Shamrocks on the Common by a score of 28 to 8.

At Lowell the King Philips of Boston partially redeemed the defeat of 12 to 0 received a week ago, by defeating the Bartletts by a score of 12 to 5.

At Lynn, Saturday, the Live Oaks defeated the Kirtlands by a score of 31 to 0.

On Saturday afternoon, a match game was played between the Etnas of Boston and the Longwoods of Longwood, resulting in a score of 19 to 13 in favor of the Etnas.

The cricket match between the Harvard University eleven and the Albion club of Boston at Jarvis Field, Saturday, resulted in favor of the latter by a score of 90 to 57, with an inning to spare. The Harvards scored respectively 15 and 42.

Richard A. Pennell, the champion dumb bell lifter, who recently elevated a bell weighing 202½ pounds, has issued a challenge to Henri Joigneve to put up dumb bells. Monsieur Joigneve's strength is a marvel. Pennell is an amateur, a bookkeeper by profession. At the National Amateur Tournament, held recently in New York, he lifted with his hands 1,211 pounds. It is claimed that Joigneve elevates a dumb bell 325 pounds weight.

The Harvard foot-ball players are making preparations for the coming matches with the club from McGill University. Two matches will be played, one by the Harvard rules and the other in the Canadian style. The ball used by the McGills is simply a bladder covered with leather, and is much harder to kick with than the ordinary rubber ball. The matches will be played on Tuesday and Wednesday.

The following is the score of the game at New Haven May 9th, in which the New Yorkers were beaten:—

Yale—1 2 3 3 0 2 1 1 3—15.
Flyaways—0 0 3 2 0 0 0 0 0—5.

The Concordes defeated the Powhattans at the Capitoline Grounds on May 9th by 19 to 8.

The Arlingtoners defeated the Rivertons of New Jersey on the same grounds the same day by 27 to 25.

The Hartfords again beat the Baltimore nine at Hartford May 11th by 16 to 6.

The Athletics won their third victory over the Philadelphians May 11th. The following is the score.

Athletics—2 0 0 3 5 0 2 0—12.
Philadelphia—2 0 0 4 0 4 0 0 1—7.
Umpire, Mr. Carey, of the Mutuels.

On May 11th the Waverleys of Hoboken and the Stars of Newark, N. J., played their first game for the amateur championship of New Jersey on the Elysian Fields, Hoboken. The game opened strongly in favor of the Newark boys, who led at the end of the six innings by a score of 8 to 3. In the last three innings the Waverleys improved their play, and won the game by the following score:

Stars—0 2 1 3 1 1 2 0 3—13.
Waverleys—0 0 0 1 0 2 3 5 3—14.

Umpire, Mr. J. Adler. Time of game, two hours and ten minutes. The second game of the series will be played at Newark on the 10th inst.

The St. George's Cricket grounds are to be occupied this summer as follows: By the St. George's Club on Wednesday and Thursday; the Knickerbocker base ball club on Monday and Friday, and the Stevens Institute on Wednesdays and Saturdays, four days for base ball and two for cricket.

Mr. Gibbs, of the St. George's club is in favor of playing the Boston club at cricket at the Union Grounds on the mornings of the days the champions play base ball in July.

The Staten Island club open play on Saturday next at Camp Washington, and the Journalist club at Prospect Park the same day.

Mr. Augustus Stevens, of the Union club offers to walk against any other member of the club for \$1,000 a side from Thirty-eighth street and Fifth avenue to Jerome Park gate and back. If no members of the club will accept this challenge, he proposes to walk against time. Another member of this club has made a match for \$1,000 that he will beat Mr. Bennett's time, rain or shine, the same distance, start and finish.

The following is the championship record up to May 11 inclusive:

Club.	Athletic.	Atlantic.	Baltimore.	Boston.	Chicago.	Hartford.	Mutual.	Philadelphia.	Games Won.
Athletic.....	0	1	2	0	0	0	0	3	6
Atlantic.....	0	1	0	0	0	0	0	0	1
Baltimore.....	1	0	0	0	0	0	0	0	1
Boston.....	1	0	2	0	0	0	2	0	5
Chicago.....	0	0	0	0	0	0	0	0	0
Hartford.....	1	0	2	0	0	0	1	0	4
Mutual.....	1	0	1	0	0	0	0	0	2
Philadelphia.....	0	0	2	0	0	0	0	0	2
Games lost.....	4	1	10	0	0	0	3	3	21

Mr. Weston, the famous pedestrian, is now successfully performing, at American Institute Hall, the unprecedented task of walking 500 miles in six days. He made his first 115 miles in 23 hours, 12 minutes and 8 seconds, exclusive of rest. His time and fair walking is certified to by a

committee of five men of most respectable citizens, some one of whom has been constantly present during his effort. As we go to press (Wednesday morning) he has started on his third day, having accomplished his 170th mile at 12:6:26 o'clock, making 55 miles Tuesday.

He made his start at precisely five minutes after midnight on the morning of the 11th, the track, which is a circuit of one-seventh of a mile, having been measured and certified to by the City Surveyor. It is covered with earth and shavings.

Mr. Weston disclaims being a professional pedestrian, probably making the distinction on account of the fact that he does not walk on wagers, and the effort he is now making is in response to a genuine request signed by many of the best known citizens and scientific men of New York.

In person he is below medium stature and very spare. No indication of his immense powers of endurance is given by his appearance, his legs being unusually slender, but an examination reveals the fact that the single cord most prominent behind the knee is thicker than a man's thumb. He was dressed in a fancy walking suit of black velvet, and wore stout walking shoes, covering his ankles, laced up in front. Heavy leather leggings above protected the calf. His gait is not a very remarkable one, having nothing "professional" in it, but resembling more the ordinary gait of a rather awkward man on the street. His hands are swung as in an ordinary walk, and his shoulders and head are moved perceptibly at every step. Although on examination every muscle of his body seemed in play, yet there was hardly an effort even after the hundred miles had been walked more than the most ordinary pace would demand.

Dr. Taylor and Mr. Thomas Doremus took charge of the diet and services rendered to the walker. He was only allowed oat meal broth, beef tea and crackers soaked in coffee during the day, and these he took while walking. He has no trainer, and beyond an avoidance of tobacco and injurious food no special training, but is in almost perfect condition.

After walking twenty-five miles he rested six minutes and forty seconds, and was rubbed and his head and hands bathed, while whiskey was poured into his shoes. At the end of the fiftieth mile a rest of 6 minutes and 1 second was taken, and shorter ones at each tenth mile thereafter.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

R. R., Boston.—J. H. Plair has the sole management of the salmon fishing on the Mirimichi River in New Brunswick.

G. M. C., Philorolis.—Your bootmaker would be able to give you the best information.

W. H. C.—Can a person catch trout at any season of the year from a pond that he has constructed and stocked with the same? Ans. Yes; See FOREST AND STREAM, May 7.

A. De F., New Orleans.—Please inform me where some fishing and hunting, combined with pleasant scenery and cheap living, can be had in Canada? Ans. Near Quebec, on the Jacques Cartier River.

TARGET, Philadelphia.—Gun 8 lbs., 12 gauge, 30 inch barrels, central fire, paper shells, 3½ drachms Dupont No. 1 powder, 1½ oz. No. 7 shot, distance, 40 yards, target 30 inches square. How many shot should be put in the target to be called first-class shooting? Ans. 130 pellets.

E. C., Shelbyville, Tenn.—Can the trout or bass that we have in our streams (Middle Tennessee) be taken with a fly? Early in the season we have them from the mill dams with minnows; later in still water with the troll? Ans. Can tell best when you try them.

SPORTSMAN, N. Y.—What size bore gun do you consider useful for all kinds of game, length and weight? What county in Illinois will I find all kinds of game, and what material do you think best for the barrels, laminated or decarbonized steel? Ans. No. 10 bore, 29 inch barrels, laminated steel; Dixon Co.

E. B. S., Syracuse, N. Y.—Can you tell me the name of a good book that would help me in teaching a St. Bernard dog to retrieve, and will you also tell me the best colors and points of a hound, and oblige? Ans. Hutchinson on "Dog Breaking" will give you every information; price \$4.50.

J. T. CHISHOLM, N. Y.—Your queries as to shad flies and shad fishing have already been fully answered in several numbers of this journal. We shall print additional information as we gain it. The "Romeyn fly," invented by Dr. Ely, is not a shad fly. We said it would answer for such. Hope to have the result of your experiments.

ARCADE, St. Paul.—"Birds of Long Island" out of print. Write to the Salem Naturalist about it. "Frank Forester and his friends" is published by Peterson of Philadelphia, in three parts, 75 cents each. The London edition embraces them all.

DAVY CROCKETT, JR., Philadelphia.—The rifle you mention .32, is quite good for 4 or 500 yards with the sights now on it, but for greater distances would not be reliable. A small ball, as you rightly think, would not hold up sufficiently, and be irregular in its flight. In regard to black bass, we are not positive. Have written for accurate information. Reply in our next number. Some special laws, we think, for certain counties.

W. P., Jr., Mott Haven.—Please inform me what species of bird the following description answers for: Plumage, jet black; eyes, scarlet; bill like a roosters, only longer, and white as snow; legs quite long and green; its feet were only partly webbed; it was shot in a fresh water pond at Springfield, N. J.? Ans. The Coot, *Fulica Americana*, called sea crow around New York and Long Island, and Mud Hen in New England.

F. CUTTER, Lowell, Mass.—Can I obtain No. 1 of present volume? Ans. We are short of that issue and cannot supply it. Any of our subscribers who do not bind their numbers will oblige by forwarding No. 1, vol. 2, issued Feb. 12, to this office, which we will gladly pay for on receipt of the same.

RAGING TORRENT, Allegan, Mich.—The black bass of the Kalamazoo will not (so far as my experience goes) rise for a fly; can you give any reason for it? I've tried many different kinds but have failed in getting a rise? Ans. We cannot account for the reason why black bass will rise in some localities, and not in others.

R. T. M.—We printed in last number an article on Grand Manan, but should you desire further information you will find a description in Costa's "Mt. Desert," a book published a couple of years ago upon the "New England Coast." There is a good boarding house near "Swallow Tail Head," at the north end. The only objection to Grand Manan is its fog.

W. J. G. D., Hanover, Mich.—What are Mr. Macdona's prices for setter pups, and what does it cost to import them? Do you know of any genuine Gordon setter pups in this country that can be bought, and if so, at what price? Ans. From \$35 to \$100, according to public performances at field trials or on the show bench. Write to Horace Smith, 268 South 4th street, Philadelphia.

SOCIAL, N. Y.—Will you favor an old subscriber with some information regarding fishing in the vicinity of New York City, what fish are in season at present, and where they are to be had? Ans. Hell Gate, McComb's Dam, Hackensack River, Jersey flats, Princess Bay, Jersey Kills, the Narrows, Canarsie Bay and Rockaway Beach, all within an hour of New York. For fish in season see "Sea and River" column.

W. J. P., Peekskill.—Can black bass be taken this month, trolling with spoon, in such lakes as Mahopac; if not, how soon can they be taken, and what spoons should I use? Ans. Trolling with Buel or McHarg spoon at lower end of Mahopac in June. Has the Athletic B. B. C. of Philadelphia held the championship any season within the past five years? Ans. Yes; in 1871 they were awarded the pennant.

M. M., Farmingdale, L. I.—To destroy worms on your lawn, take newly slacked lime, say 10 lbs. lime to 30 gals. of water; stir it well until well incorporated, and then let it settle; draw off the water clear from sediment, and with a rose watering-pot spread it evenly over the lawn. This will compel the worms to come to the surface of the ground, when they can be easily swept up with a broom and removed. Best done in damp weather. Two or three applications will exterminate them.

C. A. G., Rochester.—What is the best time for fly-fishing in the Adirondacks as regards avoiding gnats, mosquitoes and black flies? Ans. Go now, or in August. Is the heat oppressive in July? Ans. No. What are the prospects of trout fishing in northwestern Pennsylvania? Ans. Good in Potter, Sullivan, McKean, Cameron and Wyoming. The nearest point from this city? What is the size of streams; are they fished much, &c.? See FOREST AND STREAM, page 138, vol. II, for full particulars.

D. F. F., Leavenworth, Kansas.—What place on the Delaware River would you recommend to a person having his own sail boat and wishing to spend a portion of the summer at or near Philadelphia? Ans. Chester, Delaware City, or Newcastle are all good points and within easy distance of Philadelphia or the Bay. It is but a short run, too, round to Cape May. For trout fishing go to Delaware Water Gap, or up to Palatine Bridge, above Port Jervis, buy a flat and drift down to some point below Milford, fishing off the mouths of brooks in July. River water is warm then and the brooks cold.

W. L. P., Brooklyn, L. I.—Is there good fishing at Princess Bay? How can I get there? What kind of fish taken? Which is the best hotel? What the expense of a two days' trip? Ans. Take Staten Island steamer from Battery to the third landing, then cars to Tottenville or to South Amboy. Only weakfish are caught in the bay, but there is first-rate bass fishing, from June 10th, in the Chesequake Creek at South Amboy. Applegate's Hotel at South Amboy and good house at Tottenville. Good boats for the bay. Ten dollars for trip.

H. H. H., Amherst College.—A vessel displaces her own weight in water. Should she be so designed that, with increased velocity, her bow is raised, her stern would necessarily be depressed. We imagine that a much greater force would be required to raise a vessel bodily than to propel her. Admitting that such a form as you suggest is possible, in order to answer your second question, it will be perfectly apparent that in raising the whole vessel the centre of gravity has also been raised, and she will have less stability.

A. C. SPEER, Brooklyn.—Can you give me information of a place not further than 50 miles from New York, where hunting, fishing and general recreation are combined, the traveling expenses and boarding not to exceed \$4 a person for two days, and if hunting is allowed in the month of July, as a few friends and myself would like to go out on the 4th of July? Ans. Sportsman's Home, Smithville, Long Island; write to B. L. Sammis.

W. M. AIKMAN, Brooklyn.—Is there good trout fishing in the vicinity of West Point, N. Y., and what flies are best for that locality? What book is best for teaching the uninitiated the art of fly-fishing, fly-making, &c., and what is the cost of same and where obtainable? Ans. The only fishing near West Point for trout is in two or three streams that rise in the Fishkill Mountains. A short drive from Cold Spring, about five or six miles will take you to the head of them. There is a stream near Fort Montgomery, below West Point, that has trout in it. 2. Read the instructions now being printed in FOREST AND STREAM. Roosevelt's Superior fishing is the best book but out of print, and we believe Norris is also.

JOE S., New York.—I have two setter pups about six months old which I trained together. They both behaved well until a month ago, when one of them refused to "fetch" when I commanded him to do so, except when I tempt him with meat. Now, how can I overcome this difficulty? Ans. Keep him pretty hungry, and before giving him his food make him "fetch" three or four times, and reward him by feeding; if he refuses to do this, throw a bone with some meat on it twenty yards or so and make him "retrieve" it five or six times, not allowing him to eat it until he performs the task successfully, and then give it to him, at the same time praise him. Continue to do this at every meal and you will have no trouble.

R., Augusta, Me.—Please inform me through the columns of your paper what flies are best for shad fishing? Ans. There are no shad flies *sui generis*. There is a natural fly called the "shad-fly," which swarms on Lake Champlain and the interior lakes of New York State in the latter part of July, which the whitefish, *coregonus albus*, (called shad there) take greedily. It is nearly an inch long, and grey. Without assimilating the characteristics of the *coregonus* and *alosa* (salt water shad) we reason from analogy that grey and brown are best colors for shad flies; but such flies should be small, as shad have small mouths. Prime and Norris and Chalmers recommend browns and duns. With this ground plan for operating make your experiments. We pin no faith on a multiplicity of patterns in fly-fishing for any species of fish.

AQUA, Germantown, Penn.—I have a pond about 50 feet square, and from 1½ to 4½ feet deep. It is supplied with a spring. I have been thinking of raising gold fish, and can you inform me when they spawn and how many females to put in for every male, and whether it is best to put in large or small fish, and how to tell the male from the female; and how long does it take from the time the fish spawns until they are hatched, and if they deposit their spawn beneath the surface of the water or on the edge of the pond; would 150 gold fish be enough to stock the pond, and how long would it be until the fish hatched would be 1½ or 2 inches long? Ans. Your pond is quite suitable for your purpose. They spawn all through the spring, according to the temperature of the water, mostly during the latter part of April and May. One male with ten to fifteen females is sufficient. Preferable for stocking, about four or five inches long. The difference in sex is in the length of the dorsal fin; in the female this extends to the tail, but in the male it is quite short. The spawn is deposited on the edge of the pond. Your pond is large enough to hold from two to three hundred. In the fall. They grow very rapidly at first.

—Some of our Brooklyn people have a patented process for extracting the bones and superfluous oil from the menhaden, or moss-bunkers, hitherto useless as food, and then salting the fish, which they claim are fully equal to No. 3 mackerel. Thus all parts are utilized. Formerly, the menhaden were used only for manure, being spread bodily upon the farm lands, where they emitted an odor most offensive. As we have stated in previous numbers, the oil manufacture has become a very valuable commercial interest.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "FISHING TOURIST," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, MAY 14, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, May 15th.—Billiard match, Dion vs. Daly, Tammany Hall—Kentucky Association, Lexington, Ky.—Atlantic vs Boston B. B. C. at Brooklyn—Mystic Park, Boston, Mass.—San Jose California Association—Prospect Park trot.

SATURDAY, May 16th.—Mutual vs. Boston B. B. C. at Brooklyn—Athletic vs. Chicago B. B. at Chicago—Lexington Association, Lexington, Ky.—Boat Clubs practice day at Harlem—Opening day of Staten Island Cricket Club at Camp Washington—Opening day of Prospect Park Cricket Club at the Park.

MONDAY, May 18th.—Boston vs. Philadelphia B. B. C. at Philadelphia.

TUESDAY, May 19th.—Beacon Park, Boston, Mass.—Ambler Park Society, White Marsh, Penn.—Boston vs. Baltimore B. B. C. at Baltimore.

WEDNESDAY, May 20th.—Cricket match, St. George's Club vs. Marion, at Hoboken—Beacon Park, Boston, Mass.—Ambler Park Society, White Marsh, Penn.—Boston vs. Athletic B. B. C. at Philadelphia—Hartford vs. Atlantic B. B. Club at Brooklyn—Mutual vs. Chicago B. B. C. at Chicago.

THURSDAY, May 21st.—Beacon Park, Boston, Mass.—Hartford vs. Philadelphia B. B. C. at Philadelphia.

A WHINE.

THERE is scarcely a weekly paper in the country that is copied more than the FOREST AND STREAM, and scarcely one that is credited less. With comparatively few honorable exceptions, the press fileh from us without scruple, copying not mere paragraphs, but whole columns without credit. Now the FOREST AND STREAM employs the highest order of talent, which is not available to the newspaper press, because the brains of most of our contributors are not in the market. They do not belong to the regular corps of paid writers. Our research, naturalistic, scientific, and geographical, has already covered our whole continent, and we are constantly producing material from Army officers of frontier posts, tourists, explorers, and commissioned naturalists, which is entirely new and hitherto unpublished; and since much of this material is collected with considerable expense to us and through peculiar influences, we claim to be an original paper, and therefore especially deserving of credit. We wish it distinctly understood that we seldom publish selected matter, and when we do, we scrupulously give credit. Even our foreign translations in French, German, and Spanish, are prepared in this office. So, gentlemen of the press universal, if you have any conscience that does not belong to any one else, we shall be pleased to give you credit for it, if you will only give us credit for what we know and what we do, to say nothing of what we try to do.

OUTDOOR PASTIMES.

THE fine weather for the last week has been unusually propitious for athletic exercises and outdoor pastimes. We are happy to see a favorable departure from old time rules as regards our best and most influential citizens, who are taking a lively interest in the many healthful exhibitions which produce the best, hardiest, and kindest of men. In fact, all outdoor pastimes are receiving a fresh impetus throughout the Union. Mr. Bennett's walking race on Tuesday, May 5th, opened the ball favorably, and tended to set an excellent example to our amateur pedestrians. This performance was equal to any scratch race that has taken place in this country or in England, taking into consideration that both gentlemen lead a comparatively sedentary life, and that their occupations exercise the brain and not the muscles, also the general bad condition of the road, and the want or lack of previous training.

Mr. Weston, the celebrated pedestrian, is now endeavoring to complete his arduous task of walking 500 miles in six days of twenty-four hours to a day, or at the rate of three miles and a half in an hour for 144 hours. When he eats, drinks, or sleeps is perfectly immaterial to the outside public, so long as he accomplishes this test of the wonderful endurance and lasting powers of man. It is whispered that Weston's walks hitherto have not been conducted quite as they should be, but we trust that this match against time having been sanctioned and managed by some of our ablest medical men and well known citizens, that all matters appertaining to time occupied in eating, drinking, sleeping, and walking will be accurately recorded. It may not be out of place here to state that Captain Barclay-Allardise, of England, laid a wager of one thousand guineas that he would walk one thousand miles in one thousand hours; one exact mile to be walked in each hour. The bet was taken by Mr. Fletcher Read, and the match took place in October, 1808, over a measured mile on Newmarket Heath, the Captain winning. This is the only match of the kind where any dependence can be placed on time, and is on record as such in the office of *Bell's Life*, in London.

The New York Athletic club, a most influential body of gentlemen, most of whose members have been in actual service during the winter, commence their outdoor spring meeting the latter part of this month. Now that walking for amusement and recreation is becoming more and more every day a habit amongst us, we should wish to see this club engage rooms, with a covered track for winter work, and a gymnasium of their own. Then, again, the New Jersey Athletic club, a comparatively new organization, inaugurate the coming spring meeting on Decoration day on their grounds at Ridgewood, N. J., when we hope to see the entries full, and the grounds patronized by hundreds of amateur athletes.

CO-OPERATIVE GAME LAWS.

THE New York Society for the Protection of Game held its last monthly meeting of the season at the residence of Clinton Gilbert, Esq., on Monday evening, 11th instant, Royal Phelps, Esq., in the chair. Among other business a committee of three was appointed to confer with the "West Jersey Game Protective Society," with a view to aid in restocking suitable lands in New Jersey with pinnated grouse, the same to report at the next meeting of the association.

Colonel Wagstaff, member of Assembly from the Seventh District, reported that the amendments to the game laws, asked for by the association, had been passed. The laws, as amended, extend the time for killing deer twenty days, and prohibit the killing of the animal in Suffolk county except during the first fifteen days in November of each year. The laws also prohibited the killing of woodducks in the spring.

Messrs. Charles E. Whitehead and Thomas N. Cuthbert, counsel of the association, reported that they had been successful in the case of Phelps against Racey, in which suit for \$2,500 for the possession of 100 quail out of season was brought by the association. The higher court had affirmed the decision of the court below, and awarded the association the entire amount claimed. They had also recovered \$100 on a second suit from the same party. The announcement of these important victories of the association was received with applause.

The committee to which had been referred the resolutions offered by Mr. Charles Hallock in reference to a uniformity of the game laws, submitted the following report:—

That on the examination of this subject they note the varying laws that govern the protection of game, and that the variations in the legal times of killing game does not depend upon the periods when the animals have ceased breeding, or upon the different climates which advance or retard incubation, as much as they do upon the accidental selection by the legislatures of the law of some other State or Territory as a model. In some instances the breeding season of some fish has been made the open season. In other circumstances open seasons have been created for song birds, which should never be allowed to be killed, as for instance the brown thrush, in section 10 of the law of our own State. But particularly we note the objection that adjoining States in the same latitude, and affected by the same climate, and stocked by the same kinds of game, have different seasons in which they may be taken. The injury done by this is manifest. It not only imperils the existence of the bird in the State where it is adequately protected, but it renders nugatory, to a large degree, the proper law in the adjacent State, because most of these laws are enforced by prosecuting the venders of the game, and if game killed according to law in one State is sold in another State where it is illegal, the vender can plead that the game was killed in an adjoining State where the killing was law-

ful, and thus not only escape himself, but render convictions under the law so uncertain that few will undertake the risks of prosecuting. It oftentimes occurs that the breeding place of some game may be in one State, while the game in the autumn moves to other grounds, as in the case of woodcock, and a great temptation is thrown in the way of those who live near the breeding place, and know that in a few days the birds will move off where they will be killed, and they not allowed to participate in the chase. The reasons seem even stronger when applied to fish in rivers which run through several States, as, for instance, the Connecticut, which is liable to be fished by the citizens of four different States, any one of which could prevent by their action the enjoyment of the fisheries by any of the others.

There are certain zones of climate where the birth and maturity of game are so nearly simultaneous that the same law could govern in all. Take, for instance, the quail in Connecticut, New York, New Jersey, Delaware, Maryland, Pennsylvania, Ohio, Illinois, Indiana, Michigan, Iowa, Wisconsin, and Minnesota. These birds are a staple game bird of great market value and field pleasure.

Their incubating season may vary between Central New York and Maryland about two weeks, and in either place will be advanced or retarded that much of time by the character of the season. In none of these places, however, do any laws propose to open the season at the precise day when the birds are grown. A reasonable margin of time is made, extending from October 1st to February 1st. In our own State the open season is from October 20th to January 1st. These States, on this subject, had their laws been uniform as to times, would be perpetually aiding each other; now they are the cause of stumbling and uncertainty. Another matter which is essential to a complete system of game laws is to have as many kinds of game as possible condensed into the same close season. Each State has not only varying times to commence shooting the same game, but also varying times to commence shooting the different varieties of game. Thus in our own State the shooting season for woodcock begins July 3d; for quail, the 20th of October; for partridge, the 1st of September; for starlings, the 1st of August. Country people do not carry these dates in their minds, and are led into error; and those seeking to enforce cannot tell whether a sportsman in the earlier months is pursuing legal or illegal game, and there is a total absence of a fixed, definite time in the public mind when field sports begin.

The same irregularity in our laws exists in those of the other States. No greater step in advance in these matters could be made than by having a fixed, permanent day when all shooting might begin.

We cannot pass in silence one general omission existing in the laws of all the States. No provision exists protecting the migratory birds that visit us in the spring of the year. English snipe, plover, dowitches, and the many varieties of birds that enliven our beaches, are wholly unprotected by law, and are killed and sold in the markets in April and May in large quantities. When the spring is late, and the birds are delayed in their passage, they are found full of eggs, and sometimes are forced to nest within the State.

These birds should be protected in every State, no matter where they are flying to, for they are the children of our common country, and are gladdening every part of it in their migrations. No rule is so good as the rule that no gun is to be fired at birds or animals in spring or summer. Every reason of health to the eater, of abundance of supply of the article eaten, of justice to the animal when breeding or preparing to breed, plead for the fullest and most comprehensive and uniform laws in these matters, and therefore we submit the following plan and resolutions:—

Whereas, The general sentiment of the country is in favor of the creation and immediate adoption of some system which will secure in the different States and in Canada greater uniformity, and consequently greater efficiency in the laws for the protection and preservation of game, and inasmuch as a plan for securing these objects through co-operative legislation of all the States was submitted to the American Fish Culturists' Association, and unanimously endorsed by it last February, and since then by other similar bodies in various parts of the country.

Resolved, That it is expedient and necessary to call a national convention at the earliest date consistent with a careful and general scrutiny of the scheme; and inasmuch as this body, the New York Society for the Protection of Game, has already discussed it in session and submitted it to legal gentlemen of experience for examination and secured its approval, we do hereby recommend and advise that a circular letter be addressed to each and all the sportsmen's clubs, acclimating societies, natural history societies, and fish culturists' associations throughout the country, wherever available, inviting an endorsement of the same, and requesting that a written notification of such endorsement, signed by their respective Presidents and Secretaries, be sent to the Secretary of this society, to be filed, and that the said letters shall express the choice of location and date of year at which the national convention shall be held, and if it shall be found upon examination at the end of six months that the favorable responses are sufficiently numerous and widespread to be regarded as representing the wish of the country, then a call shall emanate from this New York Society for the Protection of Game, designating such time and place for the meeting of the Convention as shall appear to be the wish of the majority of the societies responding. All of which is respectfully submitted.

WILLIAM C. BARRETT, }
CHAS. E. WHITEHEAD, } Committee.
CHAS. HALLOCK, }

May 11th, 1874.

The report was adopted, and ordered to be printed.

Two new members were admitted, and His Excellency Governor Dix, of New York, was made an honorary member.

It was resolved that the President be authorized to give credentials to not more than five members of the association who may desire to attend the State Sportsmen's Convention at Oswego next month. Resolutions limiting the number of members of the association to 100, and doubling the initiation fee, were also adopted, and the meeting adjourned. The next meeting of the association will be held in November next. At the adjournment of the meeting the members partook of an elegant supper, which had been prepared by Mr. Gilbert.

JUDICIAL DECISION OF THE GAME LAWS.

THE general term of the Common Pleas Court has rendered a decision which will largely control the defenses made to the Game Laws. Mr. Racey is a large poulterer in Center Market and has a refrigerating house large enough to hold all the game killed in the State. He buys immense quantities of game when it is cheap just at the close of the open season, keeps it over till spring and then sells it at large profits. The Society for the preservation of game proposed to stop this trade and under the advice of its counsel, Mr. Charles E. Whitehead, after vainly urging its abandonment, brought suit against Mr. Racey under the statute for several thousand dollars penalty. Mr. Racey defended on the ground that he was entitled to preserve game killed in season by his freezing process and no law could prevent his enjoying the use of it.

To this plea the plaintiff demurred and obtained a judgment in the court below for the whole amount of the penalty, and this judgment has been now confirmed by the general term on appeal. The opinion of the Chief Justice is so important to all interested in this important subject that we publish it at length:—

ROYAL PHELPS vs. J. H. RACEY.
Daly., J. C.

The judge below sustained the demurrer so far as it applied to the answer put in to the first and second causes of action averred in the complaint from which decision the defendant has appealed, and the judge overruled the demurrer to the answer to the third cause of action in the complaint, from which decision the plaintiff appealed.

I shall first consider the defendant's appeal. The act, (Law of N. Y., Vol. 1, 871, p. 1, 671, § 7,) declares that no person shall kill, expose for sale or have in his or her possession any quail between the 1st day of January and 20th day of October; or any grouse commonly called partridges or pinnated grouse, commonly called prairie chicken, between the 1st day of January and the 1st day of September. The answer admits that the defendant had in his possession and exposed for sale on the 15th of March, six quail, and that he had in his possession and exposed for sale on the 19th of March two pinnated grouse, which was admitting the cause of action stated in the first two counts; the plain import of the act being, as was held in *Bellows vs. Elmendorf* 7, Lansing 462, to prevent any evasion and make all persons liable who had possession of or exposed such property for sale.

It makes no distinction between game killed within or without the limits of this State except in the case provided for in sec. 33, *Phelps vs. Trim, et al.*, J. Van Brunt, Supreme Court special term, February, 1873. So far, therefore, as respects this appeal, the judgment below should be affirmed.

The assumed unconstitutionality of the law I shall consider under the next head.

In answer to the third cause of action the defendant admits that he had in his possession on the 19th of March one hundred quail, and in justification thereof, avers that he is an extensive dealer in game; that he has patented an apparatus by which he is enabled to preserve game after it has been killed for the period of a year; that the one hundred quail admitted to have been in his possession on the 19th of March, were put up by him in the said apparatus in the month of December, 1872, when the killing of it was not prohibited by law in this State, or after receiving it from States where the killing of it was at the time legal. By the 33d section of the act it is lawful to sell or have in one's possession quail from the 1st of January to the 1st of March, provided the party proves that it was killed within the period allowed by the act or killed outside the limits of the State at some place where the law did not prohibit such killing.

This right, however, is limited to the 1st of March, and the defendant admits that he had there one hundred quail in his possession afterwards, that is on the 19th of March. The justification he sets up is, that he had them then in his patented apparatus in which they were placed at a time when the killing of them was lawful. But the statute has made no provision for such a case. It has allowed game to be killed before the 1st of January, or in States where the killing of it was at the time lawful, to be sold or kept in possession between the 1st of January and the 1st of March, and that is all. Beyond that the prohibition is positive that no person shall have any of the game specified in his or her possession, and I am wholly at a loss to see upon what ground it can be said that the possession which existed in this case was not the kind of possession which the statute meant. It may be that when the law was made that no such thing was contemplated as that game killed in the autumn of one year could be preserved, (as in this case,) so as to be sold a year afterwards within the prohibited period. But we cannot say so as a matter of law, for, for all that we know or for all that appears in this answer, this apparatus may have been known and in use when this law was enacted. In *Bellows vs. Elmendorf*, supra, the skin and carcass of the deer was bought at the Sheriff's sale and sold by the purchaser to the defendant, whose possession was held to be in violation of the act. In that case the animal was killed within the forbidden period, which commenced on the 1st of January. It was killed on the 6th of January and purchased on the 21st of that month, and for all that appeared the defendant may not have known when it was killed. The law allowed persons to have such game in possession or to expose it for sale for ten days after the 1st of January or to possess or sell it if received for sale prior to the 11th of January.

The carcass and skin was levied upon on the 14th and sold by the Sheriff and purchased by the defendant on the 21st of January, and this was held to be a possession on the part of the defendant in violation of the act. The difference between that case and this is, that there the game was killed within the prohibited period and here it is answered that it was not; in connection with which, it is sufficient to say that the act under which the present action is brought, has made provision for the sale and keeping possession of this particular kind of game after the period when it is allowed to be killed and that time had expired when the defendant, as he admits, had the one hundred quail in his possession.

The words of the statute are expressed that no person shall have game of this description in his possession within the prescribed period; a prohibition that may have been designed and probably was, to take away any inducement to kill these game birds within the prescribed period, as nobody can after that period commences lawfully have or keep them in their possession.

The objection raised that this act is unconstitutional, is untenable. It violates no regulation made by Congress in respect to commerce and deprives no one of property.

The act held in *Wynchamers vs. The People*, 13, N. Y., 378, to be unconstitutional, was very different.

If authorized the destruction of the property of persons owned by them when the law took effect. Here the quails were acquired by the defendant's own showing after the law was in force, and with knowledge of the existence of it, which is a very different case. *Slaughter House cases*, 16 Wall, 36.

The judgment as to the answer to the two first counts, should, in my opinion, be affirmed; and as to the third count, it should be reversed and judgment given for the plaintiff upon that count.

—An otter was caught in Westfield, Vermont, recently which measured four feet seven inches from tip to tip.

THE WIMBLEDON TARGET.

OUR most thorough contemporary, the *Volunteer Service Gazette*, devotes some three pages to the views of eminent riflemen in England in regard to the vexed subject of the new regulation targets to be used at Wimbledon. Perhaps the most interesting of them all is a communication from Mr. Edward Ross, well known as the best of English riflemen. Mr. Ross objects strongly to the change, and a portion of his letter is so interesting that we reproduce it as follows:—

"With regard to the other changes, which are mere matter of paint, and cost nothing, I only wish to point out that considerable misapprehension seems to exist with regard to the reduction of the bull's eye. It is assumed that the smaller the mark the greater the skill required to hit the mark; but that is not necessarily so. It entirely depends on whether or not the size of the mark is within the compass of the rifle. If it is proved when a rifle is fired from a machine rest at a given distance, that it cannot be relied on to hit a smaller space than, say two feet in diameter, then it is no proof of extra skill on the part of the firer if he should chance to place a few consecutive shots in a space of six inches; his doing so would be entirely attributable to circumstances over which he has no control. And his opponent, who places the same number of shots over a wider space, but within the two feet circle, deserves just as much credit; he has done all that the rifle can be relied on to do, and anything more than that is a chance."

We have taken some trouble to bring all this subject of changes in form of targets before our own riflemen, so that all the *pros* and *cons* may be thoroughly understood. We would call particular attention to the system of marking, proposed by our contributor, "T. C. C.," in our present number, whose articles on rifle shooting at long range have been so thoroughly appreciated by our marksmen. We feel certain that the connecting link between the targets as to their capacity of showing finer shadings as suggested by "T. C. C.," and the method of making the riflemen instantly acquainted with the exact position of the ball on the target, will soon be found without advocating an automatic process. We think that the system of squares could be readily telegraphed by ground wires to the shooter by means of the simplest telegraphic instruments a thousand times less complicated than those machines which print off the movements of the stock board. We only intend to be suggestive about these things and are looking to the future. For the present, we are perfectly satisfied with things as they are, though we do believe that before the Creedmoor season is over some improvements will be made in the method of signalling the shots. We are awaiting every day for the clever telegraph inventor, (and there are a thousand such,) who will patent such a contrivance.

Sporting News from Abroad.

WE have frequently commented on the peculiarities of the English laws in regard to the rights of the chase. In the last issue of the *FOREST AND STREAM* the article entitled "Trespass and Game Protection" gave an insight into the peculiar character of these laws, and how certain privileges were combined with the holding of property. Some time ago we expressed our astonishment that in Ireland there were certain restrictions still enforced about keeping greyhounds. A hare, to use an appropriate bull, having become of late a *rara avis* in the Emerald Isle, its scarcity is said to have arisen from the fact that people who had no rights kept greyhounds. Quite lately a Mr. Kilmartin was prosecuted and fined for keeping such dogs without the proper qualification. Our most learned contributor, B., adverts exactly to those peculiar laws which have a bearing on these cases. There is an old law, of the time of William III., which reads that no one not possessing a freehold of £40 a year, or a personal property worth £1,000, can keep either hounds or spaniels. In 1787 this law was made even more comprehensive, for pointers, beagles, and greyhounds were added to the list. Though in the present case five magistrates were on the bench, and two dissented, the sanctity of a wretched old law was carried out and Mr. Kilmartin was fined. Our English contemporary very properly expresses the desire "that such unnecessary restrictions should be abolished with all convenient speed, and that all Irishmen henceforth should be permitted to keep whatsoever dogs they please." We note these facts to show how these stupid old privileges are allowed to remain on the Irish statute books, which are as *arriere* and as much behind the age as would be the black letter Norman law if we applied it to-day for the government of a State. It is exactly such restrictions against free rights and common sense which cause dissension among the Irish. As far as field sports go, perhaps by their enactments not a single hare more is allowed to live, and they are capable of promoting much graver political troubles. Think of it! In A. D. 1874, an Irishman cannot keep the kind of dogs he wants to.

—We feel very much obliged to a correspondent in *Land and Water* for bringing to the attention of English readers the fact that large quantities of prairie chickens, together with other game, were exposed for sale at the poultry shops in London and elsewhere, at a late date. The writer says:—"No sportsman can help feeling disgusted on passing any poulterer's shop at this time of the year (April 18th) at the sight of the quantities of prairie fowls exhibited for sale, the birds being now nearly tasteless, and what taste they have resembling carrion." In our issue of April 23d we called attention to the fact of the large numbers of prairie chickens exposed for sale in Liverpool, and showed how these birds must have been killed in our close season. To

sell prairie chickens in London up to the middle of April must be to offer to our English game eating friends a most disgusting mess, as unpalatable as unwholesome. After March 1st pinnated grouse are no longer edible. Our thanks are then due to X. Y. Z., of the *Land and Water*, who protests against the disposal of our game birds in England at improper seasons.

—Perhaps as we write this the Grace team will be at home in England, and after a week or so of rest we may have to record once more the prodigious efforts of the cricketer Leviathan and of the other mastodons. If on their Australian tour they have not exactly swept away whole forests of stumps, they have achieved some wonderful victories. Just think of the odds all the time—eleven *versus* twenty-two. Australia has developed some elevens of distinguished merit. A correspondent to *Land and Water*, possibly the writing member of the eleven, says:—"We have now played nine matches, five of which we have won, three we have lost, and one has been drawn. It was not owing to the bad ground that we ever lost a match at all, for although they (the Australians) play much better than I ever expected, they are not anything like a match for this team." Some day, to revive that forever hackneyed quotation of Macaulay's, we may say "The Australian striding over the ruins of Lord's cricket ground will bowl out the last of England's cricketers." We sorry to notice that there has been the least suspicion of ill humor somewhere. Something is said about Australian bounce and American bunkum in regard to these matches. We fancy that that curse of all sports, betting, has had something to do with the matter.

—Last year one of our leading New York journals gave a most humorous account of the canoe cruising in our waters, and how a New Jersey coroner, in quest of a job, kept hovering in the neighborhood of the canoeists. They have had a grand cruising on the Thames, starting from Greenwich, and from all accounts they must have had a good time of it amidst wind, water, and hail. The frailty of the crafts and the pluck of the skippers seemed to have excited the admiration of even the regular old salts. In an amusing account in the *Field*, one beery bargee having examined a canoe, and seeing its occupant alive, at table next day remarked, looking in the canoeist's face, "Go it, guv'nor; that's the last breakfast you'll ever eat." It seems to have been a jolly cruise, however. Everybody got wet, and had hairbreadth escapes, but all came in safe, the members of the cruising club "expressing the greatest satisfaction," and are ready to try it over again.

—Blessed dog! Talk not to us of instinct, sagacity, friendliness, or affection developed in man's most faithful companion, but think of this trait of character, which surpasses them all. There is in England a Newfoundland dog, a prize winner at the Crystal Palace show for beauty and intelligence. Now this dog has manifested a devotion to man, and an abhorrence for bad music. Street bands are this dog's peculiar abomination. If a German band strikes up in his neighborhood they are instantly and ignominiously dispersed. His pet hatred is a trombone. He will only snarl at a French horn, individually; but this admirable creature always singles out the trombonist, and invariably brings him and his instrument to grief. If we had only such a dog; say even a pack of them, for just now as we write this a prowling band are absolutely loosening the Guidette pavement in our neighborhood, and curdling the ink, like as if it was milk in a thunder storm, by their discordant jarrings. If Dr. Stables, M. D. R. N. and H. M. S., will only send us one of Pembroke's issue we promise to treasure him. Just around the corner there is a field for the fullest development of all those endearing qualities which this Newfoundland dog is said to be celebrated for.

PINNATED GROUSE IN ENGLAND.—Richard Valentine, Esq., the industrious Secretary of the Wisconsin State Poultry Association, informs us that he has made arrangements to procure a few clutches of pinnated and sharp-tail grouse eggs for setting, and proposes to send a couple of dozen to England, to determine by experiment whether they cannot be as easily and successfully hatched there, as are the eggs which our poultry breeders receive from England and hatch here. Mr. Valentine having requested us to name certain gentlemen in England to whom he might send the eggs, we have designated those whom we believe would pay special attention to the rearing of these birds. We have to thank the worthy Secretary of the Wisconsin State Poultry Association for having met the views of English sportsmen, who are desirous of introducing our game birds into their country. Later we will give the names of those who have received the eggs, and will acquaint our readers with the success of the experiment.

THE ADIRONDACK PARK.—Mr. Alvord has charge of the Adirondack Park bill in our State Legislature, and he has assured our travelling representative that it will pass almost, if not quite, unanimously. Verplanck Colvin, Esq., who was appointed to prepare a map of the region and make his report to the Legislature, claims to have discovered and named thirty-eight *new* lakes in the North Woods. He has promised our readers an account of his adventures there last winter, as soon as he can find time to write them.

—Seth Green, the veteran Fish Culturist, writes all his notes with lead pencil on scraps of paper, but these rough notes, tossed off like chips from a sturdy axe, always contain words of wisdom. Seth is very modest withal, though possessing a commendable degree of pride in whatever work he undertakes or accomplishes.

Shot Gun and Rifle.

MAY IS A CLOSE MONTH FOR GAME.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

THE SIGHTS IN USE AT CREEDMOOR.—In response to numerous questions sent us in regard to the various sights allowed at Creedmoor, we give cuts of the same. Of course there are many modifications of these sights, but they are all but slight variations of those we print. As many of our readers are not familiar with the sights, and see that some are allowed and others disallowed, the question might be asked, "Why not use for instance those sights numbered from 20 to 25, which are ruled out?" The answer is, that at a thousand yards the target being even smaller than the capital letter I, here presented, sight No. 20 would only allow the shooter to see the bull's eye and nothing else. This would by no means be considered as a not desirable object to be attained, but the trouble is, that as sight No. 20 would entirely exclude all the rest of the target, and Nos. 21, 22, 23, 24, and 25, half of the target, the lives of the markers or of persons walking across the range would be endangered, as their accidental presence before the target might not be noticed. It is a question then having to do with the safety of the range. These peculiar sights do not in the opinion of the best riflemen have any marked advantages over the other sights. Modifications of sight No. 20 have been made out of glass, shaded, ground, or partially opaque, but are still, and we think very properly, considered dangerous. All the sights allowed at Creedmoor may be had of the Messrs. Remington.

SIGHTS ALLOWED AT CREEDMOOR.

Patterns of skeleton sights. The metal work not to exceed 3-100th of an inch.

The width of the bar not to exceed 8-100th of an inch.

Nos. 6, 7, 8, 9, 10 may be used vertically.

SIGHTS DISALLOWED—FROM 20 TO 25.

The rules governing the sights on rifles of the National Rifle Association at Creedmoor, are the same as those in force at Wimbledon, and will be followed in the match with the Irish Team.

CREEDMOOR.—The first match of the season will take place at Creedmoor on Saturday next the 16th of May, with the sixth competition for the Amateur Rifle Club badge, to be shot for by the members of the Amateur Rifle Club. This match will decide the ownership of the badge, as may be seen by the resolutions passed at the last meeting of the club. It has been won so far twice by Mr. John Bodine, (score 25. 27.) twice by Mr. J. P. M. Richards (26. 27.) and once by Mr. Robert Omand (25.).

Conditions:—Open only to members of the Amateur Rifle Club, with any rifle not over ten pounds in weight, the trigger not less than three pounds test pull; telescope sights excluded; distance, five hundred yards; position, any, (but without artificial rest;) rounds, seven, with privilege of one sighting shot; entrance fee, fifty cents.

Should the badge not be won by Mr. Bodine or Mr. Richards at this contest, a supplementary match will be

held immediately after, and the badge be given to whoever makes the best score therein.

We regret that want of space prevents our giving in full the various sections of the bill for the promotion of rifle practice in the National Guard, which was adopted by the New York Legislature on April 27th. We print some of the most important sections.

SECTION 1. There shall be in the Inspector-General's Department an assistant inspector-general, with the rank of colonel, in addition to those now prescribed by law, to be known as general inspector of rifle practice, who shall be appointed by the Commander-in-Chief and whose commission shall expire with the time for which the Governor may have been elected.

SEC. 3. It shall be the duty of the general inspector of the rifle practice to exercise general supervision over the rifle practice of the National Guard; to inspect or cause to be inspected, from time to time, all armories, ranges, and practice grounds, and see that the prescribed regulations for rifle practice are carried out by the National Guard, and that proper returns thereof are made, and to report direct to General Headquarters, from time to time, the improvement in marksmanship among the uniformed forces, together with all other matters appertaining to his duties.

SEC. 5. It shall also be his duty to attend the annual competition for the "State prize," and, as far as practicable, all other general competitions in marksmanship among the National Guard, and see that such competitions are conducted with fairness, and according to the prescribed regulations. He shall make an annual report to General Headquarters, in which he shall state the result of all competitions in marksmanship for any prizes offered by the State, with the names of the winners, together with such suggestions as he may see fit.

SEC. 7. No avenue, street, or public highway shall be laid out, extended into or opened through the grounds of the National Rifle Association at Creedmoor.

SEC. 8. Before any targets or appurtenances are furnished by the State, a certified copy of the by-laws and other regulations of the associations to which they may be issued shall be filed with the Adjutant-General, and approved by him, and bonds in such sum as shall be required by the commissary-general of ordnance shall be given to him to secure the care and custody of such property.

SEC. 10. For the purpose of preserving the property of the State and of the rifle associations, and of preventing accidents and maintaining order upon such ranges, the officers and employees of such associations and of the National Rifle Association are hereby vested with the powers of constables when in the performance of their duty and wearing such badge of office as shall be prescribed by the National Rifle Association, and all persons trespassing upon such ranges, or injuring any of the targets or other property situated thereon, or wilfully violating thereon any of the regulations established to maintain order, preserve property, or prevent accidents, shall be guilty of a misdemeanor.

—The Board of Directors of the National Rifle Association met at the office of Col. Gildersleeve, on Friday last. The report of the Treasurer was received, which showed a balance of \$296 87 in the treasury, and also stated the fact that the State appropriation of \$7,500, and the City appropriation of \$5,000 would be due in June. Communications were received from the Colonels of the Seventy-ninth and Seventy Regiments, requesting the lease of ground at Creedmoor Range sufficient to erect houses for the accommodation of the members of their respective regiments during the progress of matches. The Range Committee submitted resolutions giving any regiment of the National Guard and other military organizations, clubs, or associations, permission to erect buildings for their use at Creedmoor on condition that the design and character of such buildings first be approved by the Range Committee, that no spirituous liquors, or any show or entertainment be given in such buildings; also, allowing any organization to embellish the ground surrounding such houses, provided that no enclosures be made. The resolutions were adopted, and the President and Secretary empowered to make agreements with any organization wishing to erect buildings. The committee to make arrangements for an opening match reported, recommending that the opening match take place on Saturday, June 6th. The report was adopted. Fees of one dollar will be charged for admission. The expenses of the match were estimated at \$600.

—In our publication of the terms of the opening match of National Rifle Club, we stated that the weapon was any rifle; it should have been any military rifle.

In the fifth match the second score will take in addition to life membership, the Whitworth rifle presented by Mr. Clarke to be held subject to competition.

THE CANADIAN RIFLE TEAM by the last mail forwarded a challenge to the Captain of the Irish Eight. The terms are as follows: Each team to consist of six men, the Ontario team to be composed of riflemen belonging to the Ontario Any Rifle Association. Rifles any, not exceeding ten pounds, minimum pull of trigger three pounds. Ranges, 800, 900 and 1000 yards. Number of shots, fifteen at each range by each competitor. The match to take place at Garrison Common, Toronto. The challenge is signed by Captain J. J. Mason, President of the Ontario Any Rifle Association.

THE LEATHER STOCKING CLUB of Oswego, N. Y., are making great preparations for the meeting of the State Association in their city, which will probably commence either Tuesday 2d or 9th of June 1874. The club have elegant rooms situated in the central part of the city, No. 207 West 1st street, where they will be happy to receive their friends upon their arrival in Oswego. The club numbers some sixty odd members and is in a flourishing financial condition. An elegant silver mounted revolver which is shot for every year by members of the club is now held by Newton W. Nutting, Esq., the worthy Treasurer, and a thorough sportsman in the true sense of the word. The club also have an elegant morocco leather fly book which is cast for every year, which is at present in the possession of W. C. Wybourne, Esq.

The interest throughout the State in the coming State

Tournament is unprecedented, and it is expected that a larger number of sportsmen will be present than at any previous meeting.

—The Maryland Association for the Protection of Game and Fish was fully organized at Baltimore last Friday, with some sixty members. The constitution makes it the duty of the officers to give information of and prosecute all violations of the laws of the State for the protection of game and fish. The object of the society is also stated to be the securing of proper legislation to protect game and fish by legal means, and to influence as far as possible the vigorous enforcement of such laws as are in existence, and the enactment of such laws as may be found necessary to accomplish that end.

Surely our sportsmen are waking up all over the country. We sincerely hope that much benefit may result from these wide-spread efforts. What is needed now is co-operation and uniform laws for geographical belts of territory, and this desirable result we feel confident will soon be attained.

—A tyro who was "out gunning" was permitted to join a couple of sports who were after snipe a fortnight ago in Ohio, and after keeping company with them an hour or so, took advantage of a pause for nips to ask, confidentially: "Will you permit me to enquire which of you is named 'Mark,' for I hear you frequently calling back and forth?"

—A State Sportsmen's Association has just been organized at Memphis, Tennessee, for the protection of game, with the following officers:—

President, R. W. Lightburne, Memphis; First Vice President, W. E. Watkins, Nashville; Second Vice President, J. H. Dew, Columbia; Secretary, P. H. Bryson, Memphis; Treasurer, S. L. Barinds, Memphis.

—Out in Michigan, not twenty miles from the new town of Grayling, is a man who keeps a dozen hounds, and kills deer all the year round for venison to feed them with! Now, here is a fine field for operation under the proposed general game law.

SNIPE SHOOTING.—A gentleman in St. Louis, Mo., writing to a brother sportsman in Boston, Mass., encloses the following at Clarksville, Mo., about one hundred miles from St. Louis.

1874.	April.	23d.	24th.	Snipe.
L. Breech-Loader.....		60	54	114
H. " " ".....		45	56	101

W. " " ".....		20	17	26
D. " " ".....		11	15	56
E. Jr. Muzzle-Loader.....		30	65	87

Total snipe..... 395
besides a few brace of teal and some plover not counted. The weather was fine, but birds rose at long shots, and flew a mile before they lit again, but were in prime condition, about the best birds the writer ever shot.

The sportsmen in Missouri have succeeded in having a law protecting quail passed, and as they were plenty last year, and the winter mild and open, they look for a fine lot of birds next season.

—From all accounts, the country around Cedar Rapids, Iowa, furnishes some unusually fine shooting in the season. "F. D." of the Scorpion Club says:—

"Fifty-two miles from here, a place called the "Big Marsh," is a good place for swan, geese, brandt and ducks. I shot one afternoon eighty two mallards; next morning before ten o'clock I had fourteen geese, two brandt and seven ducks. In the fall you can see them by the thousands; no stooping, but get into the rushes, and just load and shoot. Spring is not as good, but fall shooting is the hunter's delight. Snipe shooting is good in spring, but nothing in fall; we generally make up a crowd and go north to Lake Geneva in Minnesota. There we don't pretend to shoot duck, only geese and brandt. Now Mr. Editor, your mouth would water to see them by the thousands. You cannot conceive any thing till you have been there yourself."

—Two amateur sportsman's clubs met at Dexter's on Long Island on Thursday March 7th, to shoot at ten birds each 21 yards rise and 80 boundary. The first contest was between the Nix Club and the Barbarians, the score stood as follows:—

	NIX CLUB.	Killed.
Mr. Austin	0 1 1 1 0—1 0 1 0 1	6
Mr. J. Henry.....	0 1 1 0 1—1 0 1 1 1	7

Total.....13

	BARBARIANS.	Killed.
Mr. Levy.....	1 1 1 1 1—0 1 1 1 1	9
Mr. Williams.....	1 0 1 1 1—1 1 0 1 1	8

Total.....17

The Chinese club won with four birds to spare.

A handicap sweepstakes was afterwards shot by members of the Brooklyn Gun Club at 15 birds each, usual rules and conditions.

Distance	Killed.
Dr. Aten.....21 yards.....	9
Elmondorf...23 yards.....	12
Winger.....23 yards.....	9
Baxter.....21 yards.....	11
Hichoff.....23 yards.....	12
W. Shipman..21 yards.....	13
H. Shipman..21 yards.....	12
Edely.....21 yards.....	6

—The Chickasaw Jockey and Bluff City Shooting Clubs of Memphis, Tenn., held a grand pigeon shooting sweepstakes last week. There were twenty-two entries and some of the best sportsmen of the State took an active part in the shooting. The conditions of the sweepstakes were to shoot at five double birds 18 yards rise and 100 boundary. Messrs. J. M. Taylor, of Lexington, Ky., and

W. E. Watkins, of Nashville were the only two who killed all the birds. In shooting off the ties at three double birds each, the men were placed three yards farther back. Mr. Watkins killed his six birds while Mr. Taylor killed but five. This result was owing to one of Watkins' birds alighting, as the other one was missed by him, consequently, by the club rules he had a fresh pair as his single miss does not count against him, and is ruled "no birds." Having killed the pair substituted he won the first prize. The following are the scores:—

J. M. Taylor—11 11 11 11—10.
W. E. Watkins—11 00* 11 11 11—10.
Wm. Bowles—10 00* 11 11 11 00* 11—9.
J. H. Dew—11 11 10 11 00* 10—8.
W. A. Wheatley—11 11 11 01 10—8.
D. D. Saunders—11 01 11 00 11 00* 10—8.
A. Gibson—01 11 11 01—8.
J. H. Erskine—11 11 11 11 00—8.
R. W. Lightburne—11 10 00* 11 11 10—8.

THE TIES.

For the first prize, Messrs. Watkins and Taylor shot at three double rises, 21 yards. The score was:

Watkins—11 11 00* 11—6.
Taylor—10 11 11—5.

W. Bowles Jr., won the second prize and J. H. Dew the third prize. Judges, Messrs. J. A. Cockrill and Horsefall; Referee, H. C. James.

—Trap shoot at Honeoye Falls, N. Y., May 2d, 1874. Twenty-one yards rise, eighty yards boundary, one and a quarter ounce shot:

W. M. Locke.....1 0 1 1 1 1 1 1 1 1 10 out of 11
R. Wilton.....1 1 1 1 1 1 1 1 0 1 10 out of 11
A. Valentine.....1 0 0 1 1 0 1 1 0 1 6 out of 11
T. Wilton.....1 0 0 0 0 0 1 0 0 1 3 out of 11
Chas. Davis.....1 0 1 0 0 0 1 1 1 1—6
Thos. Wilton.....1 0 1 1 1 1 0 1 1 1—8

ANOTHER BREECH-LOADER.

CINCINNATI, O., April 14, 1874.

EDITOR FOREST AND STREAM:—

Your correspondent "Wanderer," in your issue of the 9th, gives an account of Snider's breech-loader, which is his *beau ideal* of a fine gun. Now I don't mean to say that the Snider is not a good gun; but do say that it is a poor gun in comparison with certain English guns—one in particular, the Dougall Lockfast. He claims that the coming gun would be an American gun." Perhaps it may, but America has not, as yet, turned out a gun that could equal the Dougall in workmanship, mechanism, or finish. He says the great popularity of English guns is because we are apt to suppose that nothing is first-class except it is imported. This is to a certain extent the truth; but the great secret of English gunmakers is their power of iron working. Mr. Snider himself was aware of this fact, or he would not have gone to Europe for his barrels. Passing on to a description of the gun itself: In all breech-loaders (except the Dougall) the breech is a smooth plate against which the rear of the barrels, when closed, must rest. But the Dougall is different. This gun has two discs or projections upon the face of the false breech. These discs fit into the barrels when closed, and hold them beyond the possibility of moving. The action is an eccentric by which the barrels are carried forward before they are dropped. The eccentric is the only piece of machinery in the gun. There are no wedges, bolts, grips, or springs. The discs correspond to the hooks of the muzzle-loader, except that in the muzzle-loader the hooks are in the barrels and fit into the breech. In this gun the hooks are on the breech and fit into the barrels. As was said before, the eccentric is the only piece of machinery in the gun, so that if one should by friction, or any other manner, wear out (which I never knew to happen), five minutes would only be necessary to enable you to insert another eccentric. The barrels of the Dougall are acknowledged to be the finest in the world. They are called the "bell bore" because of their resemblance to the shape of a bell. The finish of the guns is superb. Gloan, in his work, the "Breech-loader," says of the fine work on a gun: "To my mind there should be something more to a sportsman in his gun than a mere tool wherewith he works. It should be something higher to him than a mere matter of wood and iron. There should be an element of fine art in it; a fine gun is the work of an artist."

W. L.

OLD TIME SCORES BY OLD TIME SPORTSMEN.

EDITOR FOREST AND STREAM:—

It may be interesting to the readers of the FOREST AND STREAM to know of some remarkable scores at pigeon shooting from a ground trap, made by amateur sportsmen twenty or twenty-five years ago, and perhaps few Philadelphians to-day are aware that such exhibits were then shown by gentlemen, and which even now would be capital work for professionals.

Mr. John Krider and Mr. Charles Wolbert, at Suffolk Park, met in friendly contest to decide who could kill the most birds at 21 yards rise and 80 yards boundary, and the result was as follows:

Mr. John Krider shot and scored 52 pigeons out of 54, and Mr. Charles Wolbert scored 51 out of 54, losing by 1 bird. I give this as a fact, and it is known and recorded as such. Although Uncle John is waxing old, on Saturday, the 25th of April, at the social meeting of the Philadelphia Sportsmen's Club, he proved "he was just as young as he used to be" by braving the storm and teeing the scratch in the driving rain.

"Homo."

TAUNTON, Mass., May 11, 1874.

EDITOR FOREST AND STREAM:—

The Sportsman's Club of Taunton was organized on Friday evening last by the union of the Taunton Shooting Club and the Nimrod Club. The following officers were elected:—President, S. D. Presbrey; Vice-President, H. D. Atwood; Secretary, J. Y. Anthony; Treasurer, J. M. Cushman; Executive Committee, Wm. H. Bent, J. L. Merigold, J. S. Sampson.

The new association numbers thirty-five members. During the present season especial care will be given to the shad which abound in our river, and it is confidently hoped to have some good fly-fishing for them. If successful will inform you.

R.

TROY, N. Y., May 9, 1874.

EDITOR FOREST AND STREAM:—

At a meeting of the Mohawk Game Club, of West Troy, held at their rooms Thursday evening last, the following resolution was unanimously adopted:—

Resolved, That the thanks of this club are hereby tendered to the FOREST AND STREAM Publishing Company for the handsome compiled tables of close seasons, copies of which they beg to acknowledge the receipt of from said Company.

Very truly, &c.,

H. P. SCHUYLER,
Sec. M. G. Club.

WASHINGTON, D. C., April 23, 1874.

EDITOR FOREST AND STREAM:—

The following named gentlemen have been elected officers of the National Sportsmen's Club, of Washington, for the ensuing year: President, Col. C. M. Alexander; Vice President, Col. J. R. Morehouse; Secretary, M. A. Tappan; Treasurer, A. N. Marr; Attorney, R. K. Elliott; Board of Directors, C. S. Wheeler and S. M. Bootes. Reports of secretary and treasurer show the club to be in flourishing condition.

—The Seawanhaka Yacht club will hold their annual regatta on the fourth of July as usual. This will be conducted according to the regular sailing rules of the club, which compel each yacht to be steered by a member of the club and limit the number of men to be carried, although allowing a certain proportion of them to be paid. No shifting ballast permitted in any of the classes. In order to encourage Corinthian yachting, which this club may be said to have introduced in this country, the Commodore proposes, for the smaller vessels, weekly races, crews to be composed entirely of Corinthians, and the winner in each race to receive a silk pennant. At the end of the season the Commodore becomes indebted to the extent of a valuable silver prize to the yacht having won the greatest number of pennants. It is probable that there will be many other regattas and matches in this club on the Corinthian system during the summer.

—During the past week the following yachts have been slid off at City Point, South Boston:—Sloop White Wing, Mr. E. G. Bartlett, *et al*, sloop Jennie, Mr. W. H. Bangs; sloop Fannie, Com. B. Dean; schooner Leslie, S. W. Bailey, Esq. The C. B. sloop yacht Mariquetta, lately purchased in New York by Parkman Dexter, Esq., arrived last week from that port in charge of Captain Herbert Bent. She will probably join the Boston and Dorchester clubs. Messrs. Pierce, Bros., have laid the keel for a new C. B. yacht, twenty-two feet six inches long, to be a counterpart of the Mabel, built by them the past winter and purchased by Com. Roberts. She is for a Boston gentleman and is to be ready the first of June.

—The schooner yacht Madeleine, Commodore Jacob Voorhis of the Brooklyn Yacht Club, is not expected to compete in any of this season's regattas, but her owner intends to hold her open to all challenges for matches twenty miles to windward and return.

—The members of the Columbia Yacht Club are busily engaged getting their craft in commission and intend to hold their annual regatta about the middle of June.

—The citizens of Cape May have voted \$2,500 for prizes for their prospective regatta in July and have tendered an invitation to the New York Yacht club to participate.

—The Dauntless, Commodore Bennett of the New York Yacht club, is now in commission, and has left her moorings at the foot of Court street, Brooklyn, where she has been during the past two years and now lies off Clifton, Staten Island.

—The Alert, Captain Henry Vail of the New York Yacht club, is at Greenport, Long Island, preparing for this summer's work. No alterations have been made in her case, as her very brilliant record for last season gives sufficient promise for the future.

—The sloop yacht Anna, Mr. W. A. Cumming, is at present in the hands of Mr. Kirby, at Rye, who, in addition to raising her top-sides, as we reported in a recent number of the FOREST AND STREAM, is easing her water-lines aft and fining her run, tucking up her quarters considerably in so doing.

—The first regatta of the Dorchester Yacht Club will take place May 21st, at 2 P. M., and will be open by invitation to yachts belonging to the Boston Yacht Club. The courses for different classes vary in length, but the finish in each case will be the same, passing between the judges' steamer and a stake boat anchored off the Boston Yacht Club House, which will be open to the members of the two clubs and their friends. The prize in each class will be a solid silver goblet. The following gentlemen will officiate as judges:—Wm. H. Bangs, Jr., Wm. H. Sayward, Eben. Denton, Samuel L. French, Henry B. Jackson; Regatta Committee:—Wm. H. Bangs, Jr., Coolidge Barnard, Wm. F. Halsall, Walter Burgess, Wm. A. Gilbert.

CITY POINT, SOUTH BOSTON.—Since our last announcement, the following named yachts have been transferred to their summer quarters on the wave:—The schooners Elsie, Capt. Martin; Stranger, Capt. Jones; Sloops Fanny, Capt. Appleton; Queen Mab, Capt. M. J. Kiley; Fearless, Capt. J. A. Woodward; Fire Fly, Capt. Balch; Mabel, Comdr Roberts; Charlotte, Capt. Peabody; Hope, Capt. Dix; and Water Witch, Capt. Pettengill. There are now upwards of sixty yachts at their moorings off the Club Houses.

—The yacht "Crosby" arrived at South Boston on Saturday last from Florida, after an absence of six months and four days. She is 27 ft long, and was manned by Capt. Wm. H. Reed, Jas. H. Stark, and A. R. Temple, who came home in the best of spirits and health, and are enthusiastic over their nautical trip.

—The Saratoga four of the Potomacs, Messrs. Truax, Coughlin, McBlair, and Carpenter, are practicing every day on the river at Washington, D. C. At the Potomacs' meeting last week, Messrs. W. W. Corcoran and George W. Riggs were elected inactive members, and each subscribed \$500 to the stock of the building committee. It was also agreed to accept the proposition of the Tobacco Boat Club, of Lynchburg, Va., and the Nassau Boat Club, of New York, for a series of home and home races. The club numbers 80 active and 150 inactive or honorary members.

NEW YORK YACHT CLUB.

Through the courtesy of Mr. C. A. Minton, Secretary of the New York Yacht Club, we are enabled to give our readers a complete list of all the vessels belonging to the club at the present time.

The officers of the Club for the year 1874 are as follows: Commodore, James Gordon Bennett; Vice Commodore, William P. Douglass; Rear Commodore, George L. Kingsland; Secretary, Charles A. Minton; Treasurer, Sheppard Homans; Measurer, A. Cary Smith; Fleet Surgeon, L. De Forest Woodruff, M. D.; Regatta Committee, William Krebs, Edward E. Chase, William B. Bend; House Committee, Fletcher Westray, George W. Kidd, John G. Breesford, Thos. T. Lawrence, N. D. White, the Secretary, *ex-officio*.

BOSTON, Mass., May, 1874.

EDITOR FOREST AND STREAM:—

A regular meeting of the Dorchester Yacht Club was held at the Club House, Commercial Point, May 1st, Commodore Bangs in the chair. Four new members were elected, after which the Committee on Uniforms reported the changes, which were considered advisable. A proposition permitting a change of ballast on the day of a race, (before starting,) was voted down, as was also another requiring owners to sail their boats in regattas.

Mr. Courtland Boynton applied for an honorable discharge, but, on motion, the application was denied and Mr. Boynton, in consideration of his services as former measurer, was elected an honorary member and received a vote of thanks. It was announced that the prizes offered for the Union regatta, May 21st, would be a solid silver goblet for each class; the prizes to be awarded should one boat only in each class, go over the ground. The Virginia of the fourth class C. B., 16 ft. 6 in. in length, is to receive a mast 26 ft., was originally ordered 36 ft., but was lengthened. The Bessie of the same class is to receive some slight alterations. The Mabel of South Boston, Commodore Roberts, is to have a hollow bored mast. These masts are made at Lynn and are bored in the same way pump logs are.

BINNACLE.

PERTH AMBOY, N. Y.

EDITOR FOREST AND STREAM:—

At a meeting of the Perth Amboy Yacht Club on Friday evening last, preliminaries were arranged for a race, open to all boats not exceeding twenty-eight feet on the water-line, to take place on the 30th instant, under the following summarized rules:—

Entrance fee.—Five dollars.
Prizes.—Three-fifths of amount of entrance money to winning boat. Two-fifths to second boat.
Time allowance.—One and a half minute to the foot between cat-boats. Jib-boats to allow cats two and a half minutes to the foot.
Course.—About fifteen miles, triangular.
Start.—A flying one; twelve minutes between the second and last gun. No restrictions as to ballast. Six hours or "no race."

This club is quite a young organization, owning but three boats as yet, but numbers about twenty members, most of whom are gentlemen who do business in New York City and reside in Perth Amboy.

The officers are:—Wm. Bell, Commodore; J. L. Kearny, Vice Commodore; W. B. Thomas, Secretary; Evan Thomas, Treasurer.

Nowhere on the coast can finer facilities for boating be found than here, situated as we are at the junction of Raritan River, the Kill Von Kull and Raritan Bay.

K.

PHILADELPHIA, May 9, 1874.

EDITOR FOREST AND STREAM:—

The first regatta of the Philadelphia Yacht Club for this season will take place on the Delaware River Monday, May 18, to sail at 10 o'clock precisely. The race is to be sailed for prizes given by Mr. Albert Eberner. There are two classes of yachts. All are 15 feet in length, the first class being from 5 to 6 feet beam and the second class 4 to 5 feet. The prizes are for each and the same for each, viz: First prize, one solid silver ice pitcher; second prize, one walnut chronometer 9 day clock; third prize, one solid silver castor. They are to start from Shackamaxon Street Wharf, sailing down the river, rounding the first buoy below the Block House opposite Fort Mifflin, and return, coming in between the buoy and the wharf, opposite Shackamaxon street, making a course of about 18 miles. The following entries have been made to April 27:

FIRST CLASS.		SECOND CLASS.	
Name.	Captain.	Name.	Captain.
Wm. H. Clymer—Wm. Roach.		Leo Reinfried—Theodore Helm.	
Albert Dager—A. Baisley.		Edward Eberner—Robt. Rockey.	
Albert T. Eggleston—G. W. Simons.		Little Maggie—G. Grissom.	
Windward—Frank Dery.		Annie B. Riser—H. Abrahams.	
Tyler Hamblin—John Lester.		Geo. R. Jesson—J. Rihl.	
Benj. P. Sparks—Wm. Flick.		Elisa Brode—Edward Bower.	
Kate D. Eakins—Geo. Eakins.		John B. Brewer—J. Bradshaw.	
Lizzie M. Aadis—Wm. Alexander.		Chas. Abel—W. H. Vanderslice.	
Chas. S. Austin—D. Huber.		S. A. Maier—W. Kirk.	
Willie Kleintz—Frank Kleintz.		Ida May—L. Harstman.	
Kate Leary—J. Leary.		James Wignall—D. Ahern.	
Geo. Hoff—John Smith.		S. A. Standiford—T. Ledyard.	
Harry Strimmel—Thad. Chambers.		Dollie Tilton—C. Tilton.	
Chas. W. Hillman—Chas. Bradley.		Salie—J. Rudder.	
Jonny Hillman—Henry Newlin.		Lillian—G. Bumm.	
John F. Ohl—Joseph Wood.		Rich'd P. Riddell—John Lipton.	
John Stiltz, Jr—Geo. Bratton.		George Lewis—J. Jones.	
		Enchantress—G. Long.	
		Jos. H. Leary—J. Vanderslice.	
		John D. Sidebotham—J. Dearr.	
		William D. Wieland—W. Earley.	
		Correll B. Miller—C. G. Bodine.	
		Julia—James C. Wigner.	

Yours truly,

T.

—Messrs. John Keeler, Wm. McFarlane, Owen Van Winkle, and Thomas Fearon, the well known amateur crew of the Vesper Rowing Association, of Yonkers, will take part in the forthcoming Saratoga regatta.

—The National Association of Amateur Oarsmen will hold a meeting at the Astor House, New York, on Saturday evening, May 16, when business of importance will be transacted.

—Notwithstanding the cold easterly wind which prevailed on Monday last, a very large number of people assembled at Harlem to witness the barge race between the crews of the Nassau and Harlem Boat Clubs. The two steamers engaged for the occasion were filled to overflowing, the "Seth Low" being set aside for gentlemen unaccompanied by ladies, and the "Water Lily" for the lady guests of the two clubs. Arriving at the starting point, the Nassaus were the first to put in an appearance, followed very shortly afterwards by their antagonists. Mr. Jas. Watson, who was starter and referee, was enabled to give them the word "go" at forty-one minutes past five, and off they went, the Nassaus catching the water first, and taking the lead. Both crews were in good condition, the Nassaus pulling a more finished stroke than their opponents, but the latter sticking close to them, and showing great pluck and determination; and so they went, until passing under the bridge at McComb's Dam, the Harlems earned a slight advantage, showing half a length ahead on the other side. However, the Nassaus were not to be shaken off, but slowly crept up, until, at the finish, it was utterly impossible to say which was the winning boat. The suspense was ended by the information that the Nassaus had won the goblets and colors by four feet.

SUMMARY.

Harlem River, N. Y., May 11.—Match for a set of colors, and a silver cup for each of the crew, between six-oared barges of the Nassau and Harlem Boat Clubs. Two miles straight away.

Sea and River Fishing.

FISH IN SEASON IN MAY.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo confinis</i> .
Trout, <i>Salmo fontinalis</i> .	Shad, <i>Alosa</i> .
Land-locked Salmon, <i>Salmo gairdneri</i> .	Michigan Grayling, <i>Thymallus tricolor</i> .
Black Bass, <i>gristes salmoides</i> , <i>gristes nigricans</i> .	

The amended fish law of New Jersey prohibits the taking of black bass within the State before the 1st of June.

—We have news from Barnegat that weak-fish have been caught there in nets last week, and the baymen are painting up their boats in anticipation of the coming of the blue fish, which generally strike in about the 20th of May. This year it is expected they will be a few days later. As soon as they come, our readers will be advised, as they always are of all kinds of fish in season. For the last ten days of May and beginning of June Barnegat Bay is generally literally alive with large blue fish. Next week we shall print a very intelligent article, long deferred, upon Bluefish, from a correspondent who makes Barnegat one of his chief cruising grounds.

—The first striped bass of the season were taken last week on the "Plot," (Jersey Flats). They averaged three pounds weight, and were taken with shrimp. Mummies, sand worms, shrimp, and shedder crabs in season, are the killing baits for bass. And just here, let us say that crabs are this spring very abundant in Coney Island Creek and along shore, which is always a sure sign of a plentiful run of bass.

—Twenty-five fine bass were taken at Kingsbridge May 10th from boat, with rod and line, by Messrs. Daniels and Creighton of Brooklyn.

—The warm weather of the past few days has brightened the prospects of the angler. With an almost summer temperature the snow and ice have disappeared, and the winter blockade of the northern lakes and rivers is at last broken. The St. Lawrence is clear, and on May 10th the ice went out from the Saranacs and the North woods.

THE ART OF FLY-MAKING.—*Third Cast.*—A certain school of fly-makers tie on the wings, or more properly the wing last of all, and in making an elaborate fly it is the proper way, but in ordinary trout flies, as I shall presently show, the wing should be put on immediately after wrapping on the gut. Some old-fashioned makers maintain that a pair of wings should be put on, each one separately. This is certainly unnecessary for most of the natural flies we observe on the water, if alive, have their wings folded together, appearing as one. Especially is this the case with the Ephemeridae, which are most numerous.

Let me ask the reader to cast his eye on the plate below. He will observe that the fibres incline towards the top end of the feather. Now each of these, on the sides where they come in contact, if examined with a microscope, will be found to contain a regular series of little hooks, if I may so call them, forming a connection or interlocking with a similar series on the adjoining fibre. On this interlocking of the fibres, with the arrangement of the feathers, and the oiling which the bird gives them, depends its ability to shed water as from the roof of a house, and a duck to

swim and dive and still remain dry. If you cut out a section (figure 2), and, doubling it, form figure 3, the fibres at the outer end of your wing will be of an unequal length and require pinching or clipping off of the ends after it is tied on. You will therefore, holding the stem of the feather in your left hand, stroke back the fibres gently and gradually, forcing the little hooks to lose the original connection with their fellows on the adjoining fibres and form others until you get them to stand out at right angles with the stem. After forcing as many back as will form your wing, clip them off with your scissors and double them with the under side of the feather inward, your one wing, representing a pair of wings, is ready to tie on.

In imagination, I hear some old fogey of a fly-maker say "that ain't the way," and if he agrees with me asks "why all this to do, and why your illustration." Well it may be plain to him, and tying a fly may be as natural as using his teaspoon, or putting his mug of beer to his mouth. He may be a much better fly-maker than I am, but can he write down on paper how to make his flies? I can assure him it is no easy task to tell how I make mine. But to put on the wing. If it is the last thing done, holding the smoothly folded mass of fibres together between the thumb and forefinger of your right hand, lay it on the back of the hook, the ends of the fibres extending as far back as you propose to have the length of the wing, pressing it down firmly; then bring the forefinger and thumb of your left hand into action, and releasing the hold with your right take two or three turns of your wrapping silk; look to see if it sets right, and then with one or two more wrappings, close and neat, you fasten off with the invisible knot, as described in my last paper in finishing a hackle; and so your fly is complete.

The foregoing is the English mode; but let me describe another, and, I think, more secure way of putting on the wings of trout flies. I think it originated in Ireland. It is now generally adopted in this country. Holding the hook as already described, take four or five turns of the wrapping silk, about two thirds of the way up from the bend to the head, then laying on the gut continue wrapping, but closely, leaving just enough of the hook to fasten and finish off; lay on the wing, the convex edge beneath, and the end in the reverse direction, i. e., outward along the bare gut, then, holding the wing firmly in position, take two or three turns of the wrapping, being careful that the wing does not turn over towards the opposite side of the hook, look at it to see that it sets properly; continue down the shank with a half dozen or more turns, and then clip off the root ends of the fibres, which of course are pointing towards the bend of the hook. Your wing is now secure, with the point or end reversed. Continue wrapping over gut and hook until you come opposite the point of the latter; then put on your tinsel, clipping off the surplus end, then your dubbing, extending it well up towards the head, and leaving the space to be occupied by the hackle about half as much as that so occupied when tying a fly without wings. Here you fasten in the hackle firmly, winding it on up to the point where you commenced tying on the wing; secure the end of the hackle with three turns of your wrapping, clipping off the surplus end, then double back the wing into its intended position, take two or three turns over the head or but end, and finish off with the invisible knot, as described and illustrated in last number.

A quicker way of putting on the wings is, after stroking back the fibres, and bringing them at right angles to the stem of the feather, to double them into the shape of the wing, and then, with a quick jerk, pluck it by the roots from the stem. The wing is then laid on, and the fly proceeded with as just described. The wing should extend backward just so far that the tip of it comes immediately over the bend of the hook. The fibres of the hackle should hardly be long enough to reach the same place, and the hackle itself should not be more than two thirds the length of stem required for a hackle or palmer fly.

One would suppose, before he tried it, that the wing cut or torn from the stem, as described, would be square at the tip end when tied on. A trial will prove that the end will be oval or elliptical, resembling the wings of a natural fly. The learner, of course, will find that in tying back the wing, if the turns of the wrapping silk are too near the bend of the head, the wing will set too perpendicularly, and that if the turns of the wrapping are too far back it will set too close to the body. The body in a well proportioned fly extends rather beyond, opposite the point of the hook. If the wing is too long it should be shortened by a vigorous pinch of the thumb nail and forefinger.

I had forgotten to mention that in making a body of mohair, fur, or pig's wool, the requisite quantity, after a little pulling, is placed in the palm of the left hand and rolled into the shape of an oblong cone. The smaller end is then applied to the lower end of the body, and twisting or spinning it in with the wrapping silk it is wound up the body, which is to be increased in bulk as you near the space intended for the hackle. The wild hairs of the dubbing should be clipped off, so also should awry fibres of the hackle after winding on. The picker (a darning needle, stuck head in into a small cork will answer for this little implement), when required, is brought into requisition in arranging and straightening the irregular fibres after winding on the hackle.

The mode of clipping off the but ends of the wing as close up to the head of the fly as I have described, answers in most cases, for instance for a hurl, or mohair, or fur body, but when we intend to make a floss body the surplus part of the wing should be clipped off in a direction slanting towards the bend of the hook; so that in wrapping over it with the floss the body will taper, handsomely increasing in bulk as it nears the place where you intend to fasten in the hackle. In tying flies one becomes appreciative of the minuteness of spaces, and in putting on tinsel, or in the length of the body, or in finishing off at the head as much as may be occupied by one or two turns of the finest wrapping silk, is easily judged of.

Tails.—In putting on this little "caudal appendage," as Mr. Sparrowgrass would have termed it, much nicety is to be observed. Of course it is placed precisely on top of the hook, the fibres of feathers of which it is composed should curve upward and sit gracefully. If it be a plain body, as in the fly, called the hare's ear, it is tied in on completing the wrapping on of the gut. If tinsel ornaments the end of the body, it should be put on first, and then the tail. If the body is intended to be wrapped with tinsel, it should hang loose while putting on the tail and then wound spirally over the dubbing with two, three, four, or five turns, as the case may be.

Repeating in part the directions already given for the bodies of the flies let me remind the learner that the material fastened in last is wrapped on first. Suppose for instance you wish to make a winged fly with a palmer body: After the tail is on, tie in the end of the hackle, and then—*firstly*, wrap on the dubbing; *secondly*, the tinsel; *thirdly*, the hackle, following close behind the turns of the tinsel; and it makes a better looking fly to wrap the hackle much more closely on getting up under the wings; making it a little more "buz" as it is frequently termed. A fly is said to be buz when the hackle is wrapped on thick and it looks "bushey" as we Americans would term it.

Some makers use two or three half hitches in finishing off at the head. The invisible knot is as easily tied and much more secure.

Let me describe as briefly and as plainly as I can the proper mode of using a pair of scissors. They should be such as I have described. Do not put your finger and thumb into the bows or oval openings, but lay that part of the implement in the palm of your hand and with the thumb and fingers work the blades. A little practice in this way will enable one to pick out and clip off a single fibre of the hackle or wing with great nicety. Every fly-maker has his own method, learned of others in part, and in part adopted as his own invention; the foregoing directions may therefore not accord with the mode of some who may read this paper. I can only say it is my method, and that I am always ready and anxious to learn of others a better way of performing any of the little minutiae I have described.

THADDEUS NORRIS.

—The North River shad have come at last in fair quantity though not remarkable as to size. In the Connecticut River the catch has been both large and fine. We saw in Fulton Market some twenty-five fish, all dressed, weighing ninety-five pounds; this is above the average. The Porgie or Scup (*Pogrus Arggyops*) has come too in large numbers. An immense school was struck off Narragansett beach, and the catch was so large, that in New York this excellent little pan-fish had to be almost given away. Mackerel abound. Last week they were worth \$20 per 100, this week by the arrival of some eight fishing vessels, the price has gone down to \$5 per 100. This fish is working North. Those now in market, though excellent for immediate use, are not in good condition for curing. Mackerel must live for a while in the colder waters of the Banks, before being in proper order for selling. Salmon rare, the Kennebec yield not heavy, and the price pretty high. Trout from Maine and Canada are coming in fair quantity.

We would call the attention of our Boston friends, and those desirous of preserving lobsters, to the fact that great quantities of these shellfish, not weighing a half of a pound are exposed for sale in our markets. They are brought in small smacks from Maine and Massachusetts, against the law and are sold at miserable prices. Mr. Bergh is defending the rights of the turtles. To-day with unloosed flippers, they can flap away with their arms, and fan themselves at their leisure. It is questionable whether they do not hurt themselves more this way when at liberty, than when they are tethered.

—Captain Steers of Brooklyn is going to try fly fishing for shad in the Connecticut shortly. This week he goes after trout down the Island.

—Eight hundred bass were captured by pound and seine in one day in the creek near Sag Harbor last week. This is the way the bass have been almost driven from the Peconic bays by this pound net destruction of young bass.

—The steamer W. W. Coit, in charge of Captain Gibbs, will run every Tuesday and Friday from foot of Wall street, to the fishing grounds off Orient Point, Shelter Island, Sag Harbor, &c., until June 1st when the boat will leave Mondays, Wednesdays and Fridays. There is fine duck and snipe shooting on Peconic Bay now.

Two excursion boats tried the "Fishing Banks" last Sunday. Grand result, two porgies and a bergall.

—We have few encouraging reports from the trout regions. On Long Island nothing has been done, and little attempt made to fish, on account of the gales and cold weather. Last week two of our correspondents snaked out two dozen small trout from the Slug, a very pretty stream of clear running water, near Wareham, Mass., two hours ride by rail from Boston. The Slug contains a good many small trout, but fly-fishing in it is almost impracticable on account of the bushes. This stream ought to be protected, and angling prohibited in it for three years, after which the bushes should be cut out at intervals for casting stands and the water broken up into pools and rapids by artificial obstructions. This would give Bostonians a fishing resort quite accessible and very desirable to those who have but an occasional day or two to spare for recreation.

Some few trout have been taken at Vanceboro, Maine, within the past fortnight, weighing from one to two-and-a-half pounds.

In Connecticut the season is more advanced. A letter dated April 30th, from the northwestern part of the State, by the same correspondent who so attractively portrayed the charms of this section in a letter published last week, from Twin Lakes, says:—

"Speaking of trout, you may just whisper to our friend Jackford that there is a group of the 'speckled beauties' now on the easel before me that to see would make even practised eyes sparkle more brilliantly, if that were possible. They are from ten to twelve inches in length and as well fed as caddis worms, (with which their maws are led,) and 'angle dogs' can make them. Only in the spawning season could their colors be more enchanting or their flesh more firm. You may also hint to your anxious readers that they were caught in Schenob Brook, a sluggish stream that finds its way from Twin Lakes through a long, wide and deep swamp to the Housatonic at Sheffield, and that there are a few left. You can say (out loud) that young Salisbury lawyer, whose initials stand for Donald Warner, hooked a big dozen about a month ago—on the instant the law would let him—in Mount Rhiga stream called 'Wach-o-east-in-hook,' by the aborigines for sport, and that your correspondent 'went him a dozen better' in Moore brook a couple of weeks ago in the midst of a fall of 'snow, beautiful snow,' and not a warm snow that. The Sages Ravine stream has not yet been fished far as heard from; and it is quite too early for so heading and rapid an Undine, though, in its season, it is one of the very best and always the most picturesque.

Of lake fishing, there is nothing to speak of since the ice went out, and the season for bass and pickerel hasn't come. This part of the universe is reached in four hours from the Grand Central via Harlem & Con. West. Railroad, at a cost of \$2.75 to Salisbury, where are goodish hotels, and \$3 to Canaan, where, at the 'Union Depot Hotel,' G. H. Urbin will furnish clean beds and the best of fare, barring duers, at most moderate rates."

We have no doubt that many of our readers who now are stinging about for localities easily accessible from New York, Boston, and Albany, where they can spend a short summer vacation, will be induced to favor this one. It is central to all three and can be reached in half the time that the Adirondacks and White Mountains can, and is almost wildly romantic.

—Now that the season for fly-fishing for shad advances, we would like to impress upon our readers who purpose to try this new sensation, the importance of minute observation in the following particulars: size, pattern, and color of the fly; time of day, stage of water, state of the weather, (cloudy, clear, calm or windy;) whether the fish takes the fly on the surface or beneath, and if with a swirl, bulge, or a leap; whether at edge of eddy, in the eddy, or in the quickest water; at the tail or head of a rapid; whether deep or shallow water; whether he seeks the shadow of a rock or shelter of boulder or reef; whether more than one fly is taken at once, and how much line they will reel in at a run. In a word, we desire to know whether the shad hankers for flies, or whether he merely takes one occasionally when it is thrust under his nose, as ladies accept bouquets at a party; for we do not yet know positively if the shad can be strictly classed as a game fish. There are numerous points of observation which could be turned to practical use. Some of our Washington friends have arranged an experimental trip to the Great Falls of the Potomac, as soon as the shad reach that point and the stream gets clearer and lower.

Mr H. Fahnestock, of Jay Cooke & Co., had fine sport last week at Kittinany House, Delaware Water Gap, taking large string of big trout.

—We have complete notes in type of the black bass of the Delaware, Potomac and the lakes, but our crowded space compels us to again defer their publication, to the disappointment of numerous eager inquirers. The bass season, however, is hardly yet open, and when it comes, these notes will be the more opportune.

—Speaking of fish-hooks, we have Andrew Clerk's assurance of his preference for the Sprout hook. Some writer in our paper said that he swore by the Kinsey, which is an error in a dual sense, inasmuch as Mr. Clerk never swears at all, either "by fish-hooks," or by any other thing.

—According to Rochard, a French veterinary surgeon, a simple method of preventing flies from annoying horses consists in painting the inside of the ears, or any other part especially troubled, with a few drops of empyreumatic oil of juniper. It is said that the odor of this substance is unendurable to flies, and that they will keep at a distance from the parts so anointed. If this treatment will accomplish the alleged result on animals, why is it not applicable to sportsmen in repelling black flies, midges, ect?

—Sometimes the most palatable *morceaux* that come to an editor are by private letter, not intended for publication by the writer, and this is one of them:—

"The other morning, it being very quiet, I jointed my salmon rod, put on reel, line, casting ditto and fly and commenced throwing a measured line. I am a perfect 'bungler' at fly-throwing and yet found no sort of difficulty in measuring off fifty feet and throwing the line out perfectly straight, then letting it drop gently of its own accord. I was practicing near where the cellar for my new house is being dug, and as it had rained, it was full of water. One old fellow watched me for a while with eyes and mouth and ears wide open and finally said: 'Mister! you can't ketch nothink in thar, not even bull-pouts; guess you're a little cracked, 'aint yer?'" W.

A letter from Malone, New York, dated May 7th, says: "We are making good arrangements for tourists going on from here this year; and I understood from Smith last week that through tickets were to be issued by the V. C. R. direct to Malone instead of to Point of Rocks as last summer. The resorts are looking for 50 per cent. more custom this season than last."

ROCHESTER TROUT.

ROCHESTER, N. Y., May 6, 1874.

EDITOR FOREST AND STREAM:—

Seth Green has stated that there are no trout in unpreserved streams within fifty miles of Rochester, N. Y. Yesterday a friend presented me with a brook trout measuring eleven inches, which he had caught within two miles of this city, and last year he sent me a fine string, though smaller fish, caught within four miles of our suburbs. I am not surprised that Seth was mistaken in this respect, for very few are aware that any trout have survived hereabouts. The friend spoken of above is a most remarkable fisherman, with whom I have had many tramps in the Adirondacks, and I am sometimes led to suspect that he can smell a trout as a pointer smells a woodcock. He was always full of enthusiasm. Once while fishing a rapid stream in the North Woods, where the guide had bet that he would kill the most trout, our friend towards noon suddenly missed the guide. Leaving a trout that he had been throwing for some time, he started in pursuit, suspecting what was in the wind. After a long search the guide was seen at the foot of a high fall, walled in on all sides by rocks from twenty to fifty feet high, and no possible means of approach visible. There he stood, tossing his worms into a pool covered with foam, and drawing out a fine fish at almost every attempt, with a satisfied sort of grin on his face, and the tails of the trout visible through the hole in his basket. To use an expression of Mark Twain, our friend began to "foam at the mouth" and shake the firm earth with his heavy strides. What he did further nobody ever knew, but when the rest of the party came up they found him casting his fly serenely by the side of the guide, without hat or coat, and a picturesque rent in his pants which transformed them into a fore and aft apron; but the expression on his somewhat defaced features, by scratches, bumps, &c., was worthy of Alexander the Great after a victory.

Seth Green claims that the gold fish placed in Irondequoit Bay by him will be large enough to be caught by hooks this season. A few shad placed in the Genesee River by him have been caught. A large number of bass were taken in the Genesee Rapids last season with the fly.

There are many true sportsmen here, and they are beginning to talk about where they intend to go this season. Some to Grayling, Mich.; some to Canada salmon grounds; others to the Adirondacks. Seth Green is now at Greyling after spawn. I suppose you will hear from him on his return. C. A. G.

Here is a little angling gossip which comes opportunely, just at the opening of the fishing season:—

EDITOR FOREST AND STREAM:—

Did you ever try jug fishing? It is not especially scientific; but as I have seen it practiced in the Missouri River for the channel or blue catfish it is good sport. In 1893, while waiting at Fort Leavenworth for a military outfit to cross the plains, four of us made up a party for a jug fish, and this was the manner and the result:

The night before we engaged a boat and two stout oarsmen, got a dozen or fifteen empty stone jugs, gallon size, corked them tightly, and to the handle of each tied a piece of strong twine about two feet long, with a large hook at the end baited with a lump of raw beef. Thus equipped, we started about daylight in the morning and pulled out into the middle of the stream. The current was swift and strong, and after floating down a little past Leavenworth City, we began to heave over our hardware. The jugs were towed in every direction except to the rear—jugs to the right of us, jugs to the left of us, and jugs to the front of us—and as they spread out, tossing and dancing on the surface of the water, we followed, closely watching the little fleet. It was not long before some one sung out "There's one under!" and away we pulled for the jug that was in jeopardy. And now came the excitement, for the funny fellows that had pouched the beef tried to steal the jug also, dashing off on a run or plunging to the bottom, and when or where he would come up again there was no telling. At last, however, the jug was snare to outwind him and pop up somewhere, and then the chase would be renewed. Often, when nearly reached, away he would go, Kansasward or Missouri-ward, as he happened to be jayhawker or border ruffian, and when nearly in the hand he might part the tackle and give up the jug. The fish in that neighborhood had had a bad example set them and seemed decidedly slippery. But the excitement was wild when two or three jugs were running off at the same time, and we could not divide our forces to follow each. And so we kept it up for ten or twelve miles down the river, till the Kansas City steam packet, the Alec Major, hove in sight, coming up, when we began to gather in our scattered crockery. We had arranged beforehand with the captain of the boat to lie to and take us aboard, for a row of a dozen miles up the swift current of the Missouri would have required more muscle than we chose to spare. So as the steamer checked up, we swung under the stern, made fast our boat and clambered aboard, able to boast of our luck fisherman fashion. We had secured eleven splendid catfish, ranging from ten to twenty pounds each; indeed one of them was unanimously voted a thirty pounder, and of course those we lost were all still larger. Perhaps I ought to say that these were estimated weights, and to be sure the scales do sometimes play the dickens with angler's guesses. As to jugs, we lost about half, but as there was nothing in them we didn't fret about it.

The channel cat is no mean table fish, at least so all testified who shared in the fifteen pounder dished up at dinner next day at the Planter's House, fully stuffed, baked and sanded, the flakes large, snowy white, firm as any sea fish, and of most delicious flavor. From platter experience no one would suspect him of any relationship to the huge yellow catfish of the western rivers, that grovels and sucks and sleeps in the bottom of bayous and muddy eddies. The channel catfish, blue on the back and sides, and white beneath, is lively and handsome. He feeds in swift water, and the struggle with the current hardens and sweetens the flesh. Every one knows the difference in the quality of the same kind of fish found in rapid or still water. The whitefish (*Coregonus albus*) caught in the Sault St. Marie at the foot of Lake Superior, are far better than those found in the still waters of Lake Erie. Give a dollar to a Chippewa Indian and let him go out into the Sault, the Leap of waters, poling up the steep torrent till he sees a fish, and then dropping his pole, snatching his net, and giving one quick scoop as his canoe shoots down like an arrow, and then dropping the net, seizing the pole and repeating the process, he will bring you in half a dozen or more large plump fellows, and then my word for it, you have whitefish. True, it is a good fish anywhere, but when you try those caught in the Sault, as an Irishman would say, "You will see the differ." I speak advisedly. All have noticed a like difference in trout, bass, &c., caught in still or swift water.

I ought to add that the channel catfish is said to furnish good sport in trolling or angling with strong bass tackle; but I have never tried either. It is not often that one can praise the fish or fishing of the lower Missouri, but of this cat and its catching I can honestly speak a good word.

VETERAN.

PHILADELPHIA, Penn., May 8, 1874.

EDITOR FOREST AND STREAM:—

"Jacobstaff" has fished up as new a method of catching large trout, which is older than our present fishermen. During the past thirty years I have frequently heard bait fishers describe the following as the best method of taking trout of large size that would neither rise to a fly nor take bait in the daytime: The line to be 15 feet long, attached to the centre of a shingle; obtain a nest of young mice still in the pink, the hook to be placed through the tail of the mouse; two or three such lines and shingles are thrown overboard of a moonlight night in a lake, and the boat retired to wait a bite. Towing the shingle will exhaust the trout. "RED CEDAR."

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

DOMESTICATED TROUT. How to Breed and Grow Them.

Livingston Stone. Osgood & Co. Boston.

After a most careful perusal of Mr. Livingston Stone's "Domesticated Trout," we must declare ourselves more than satisfied with the excellence of the work performed. Apart from the pure technical knowledge which the author has drawn from the funds of ichthyological lore which he possesses, the book itself is remarkable as a model of philosophical research. The whole subject is treated exhaustively, and one cannot help being singularly impressed with the amount of patient toil a book of this character must have required in order to perfect. If raising trout may be looked upon as one of the fine arts in pisciculture, Mr. Stone may be considered then as its master. Not always optimists, sometimes having to review material more or less crude on fish culture, this book of Mr. Stone's we have always considered as the leading work on this subject. Perhaps our expression of trout culture as a fine art may not be taken in exactly the proper sense we would wish to convey. What we desire to express is, that American pisciculture in its highest walks has achieved most distinguished success, and that having grappled the most difficult and highest rounds of the fish ladder, it will be by no means hard for us to become masters of all the simpler processes. The dangers and troubles in the way of propagating trout are indeed very great. Mr. Stone's book will tell you that no man should rush into it heedlessly. "Domesticated Trout" teaches the reader that, to paraphrase a well known quotation, "eternal vigilance is the price of trout." If trout be worth in Fulton Market \$1.25 a pound, the graceful yearling, the handsome two-year old, the noble four-year old can only be obtained by means of a watchfulness, which must commence at the cradle and end at the tomb, or from the time the egg is placed in the hatching-house until the fish is knocked on the head and packed in ice and sawdust for the public mart. "Domesticated Trout" grapples fairly and squarely with the all-important question, the money one. Between the estimated profit and the actual one, there always comes in that unknown quantity X, "the evil genius," as Mr. Stone calls it, the risk, which upsets the best calculations. There is no valid reason why an intelligent man, who prepares his ground thoroughly, who drives entirely out of his head all ideas of becoming an Astor or a Vanderbilt, by means of raising trout in a six months or a year, will not, in due time, just like in any other business, make a good living out of his trout ponds. In 1866 Mr. Stone asked Mr. Seth Green "How many of those engaged in trout breeding would succeed?" The answer from the Nestor of American aquaculture was as follows: "One in a million." Since that period, however, our knowledge of this subject, thanks to Messrs. Green, Stone, Lyman, Collins, Clift, Mather, Ainsworth, Leonard, Stanley, Furman and a host of others has wonderfully improved. The seed laid by Coste, in France, has borne prolific fruit in the United States, and we now attain results which ten years ago would have seemed miraculous. Mr. Stone's book is a perfect encyclopedia in its way, and we somewhat doubt if for many years to come anything much better can be produced. Written in a graceful style, it is lightened up here and there with sly bits of humor, and we defy the most indifferent reader to take up "Domesticated Trout" without feeling the deepest interest in the noblest of fish. We take, then, great pleasure in recommending Mr. Stone's book to all our readers. Those—even the most familiar with the subject—will find in it much that is novel, and those ignorant of pisciculture will certainly by reading it become interested in a subject which has particular charms. Mr. Stone's "Domesticated Trout" is exactly the book fitted to popularize American fish culture.

CHADWICK'S AMERICAN CRICKET MANUAL. R. De Witt.

New York.

In a most comprehensive volume Mr. Chadwick has given us all the rules for cricket, and a running commentary written in concise style, together with a series of illustrations, makes this work admirably adapted in every way for the lovers of the game. It is a manifold effort made by the most competent authority to popularize cricket in America. One great feature of the book is the clear *aperçu* it gives of the rules of cricket, and it will be found invaluable, not only to players, but for the use of umpires. The rules are not only given in full as in force at the Marylebone Club, but Mr. Chadwick has added explanatory notes, which must be of great assistance. The Manual is complete in every way, the author having collected all the memorable events in the history of American cricket. To cricket is added the rules of La Crosse. It must be considered as standard authority on these subjects, and we look to see it in the hands of all cricketers.

NO NAME. A Novel. By Wilkie Collins. N. Y. Harper & Bros.

The fine library edition of Wilkie Collins' novels, now in course of publication by the Harpers, is the series that most persons would be pleased to place in their libraries. It is handsomely bound, good paper, print, &c., and will, we trust, have a large sale.

—Grand Medal of Merit, Vienna, 1873, awarded W. S. Kimball & Co., Rochester, N. Y., for their tobacco.

PRIZE LIST.

FOREST AND STREAM

A Weekly Journal,

DEVOTED TO

Out-Door Sports

Hunting, Fishing, Yachting, Boating, Practical Natural History, Fish Culture, &c. &c.

It is the OFFICIAL ORGAN of the

FISH CULTURISTS' ASSOCIATION
OF AMERICA.

The Publishers of FOREST AND STREAM

In order to stimulate the development of

MANLY and ATHLETIC EXERCISES,
AS OF
FISHING, SHOOTING, ARCHERY, CRICKET,
FOOTBALL, and CROQUET.Offer the following prizes for clubs of three or more
Single Subscription per Annum \$3

Starting Clubs.—Agents, and others interested, are advised that we do not insist upon their starting with full clubs to secure our rates. They can send three or more at a time, and on forwarding the requisite number within 60 days will be entitled to same premiums as if all were sent together.

CRICKET.

For \$20 00 four copies, one year, with one best spring bat, one College bat, one Dark cricket ball; price \$7 50.

For \$25 00, five copies, one year, with a complete cricket set; one College bat, one polished bat. Clapshaw: one Dark cricket ball; one set of stumps; price \$12 00.

FOOTBALL.

For \$15 00, three copies, one year, with one Rugby football; price \$6 00.

FISHING RODS.

For \$15 00, three copies, one year, with one superior four joint light rod, suitable for all kinds of fishing; price \$7 00.

For \$60 00, twelve copies, one elegant rod: suitable for trout, black bass with fly, or for trolling bass or pickerel; as fine a rod as can be made; German silver tipped, with three tips; price \$25 00.

CROQUET.

For \$20 00, four copies, one year, with very handsome set of croquet; price \$7 00.

For \$25 00, five copies, one year, with superb set of croquet; price \$10 00.

For \$30 00, six copies, one year, with the finest set of croquet made; price \$14 00.

REMINGTON RIFLE AND SHOT GUN.

For \$75 00, fifteen copies, one year, with one Remington Deer rifle; price \$28 00.

For \$100, twenty copies, one year, with one Target rifle, 30-inch octagonal barrel, to be used for sporting, hunting, or target shooting; price \$36 00.

For \$100, twenty copies, one year, with one Remington double barreled, breech-loading shot-gun, one of the best guns ever offered to American sportsmen; price \$45 00.

SHARPE RIFLE.

For \$107, twenty copies, one year, with one Sharpe sporting or target rifle, best quality; price \$40 00.

WARD-BURTON RIFLE.

For \$200, forty copies, one year, with one Ward-Burton rifle magazine gun for large game, price \$0 00.

SINGLE AND DOUBLE BARREL MUZZLE
LOADING SHOT GUNS.

For \$20 00, four copies, one year, with one American single barrel gun, perfectly safe, blue barrels, walnut; price \$10 00.

For \$35 00, seven copies, one year, with one American double gun, handy and reliable gun every way; price \$18 00.

For \$50 00, ten copies, one year, with one double boys' fine twist barrel gun, a safe gun every way for boys; price \$26 00.

For \$75 00, fifteen copies, one year, with double gun, English laminated steel barrels, handsome finish; price \$45 00.

CASH PREMIUMS.

To those who prefer cash premiums a discount of 25 per cent. will be made on all clubs of three and upwards.

Every article is of the finest quality and will be sent free of expense.

Remitting Money.—Checks on New York City banks and bankers are best for large sums; make payable to the order of FOREST AND STREAM PUBLISHING COMPANY, 103 FULTON STREET, NEW YORK. Post Office Money Orders for \$50 or less are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.

Send the names with the money as fast as obtained, that subscribers may get the paper at once.

Miscellaneous

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The strongest and cleanest Powder made. Nos. 1 to 7, packed only in sealed 1 lb. canisters. The coarser sizes especially are recommended to owners of fine breech loading guns, giving great penetration with very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to 5. Packed in metal kegs of 64 lbs. each, and in canisters of 1 and 5 lbs.

AUDUBON POWDER,

Very quick. For woodcock and quail Nos. 1 to 4. Packed in metal kegs of 124 lbs. and 64 lbs., and in pound canisters.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes. Sizes F.g. F.F.G. F.F.F.G., the last being the finest and most used. Packed in wood and metal kegs of 25 lbs., 124 lbs., and 64 lbs., and in canisters of 1 lb. and 1/2 pound.

All of the above give high velocities and less residuum than any other brands made.

LAFLIN & RAND POWDER CO.,

21 Park Row, N. Y.

(OPPOSITE ASTOR HOUSE.)

HAZARD POWDER CO.,

MANUFACTURERS OF

Sporting, Rifle and Target
GUNPOWDER.

"ELECTRIC," in 1 lb. canisters.

"AMERICAN SPORTING," in 1 lb. cans and 64 lb. kegs.

"DUCK SHOOTING," No. 1, 2, 3, 4 and 5 grain, in 1 and 5 lb. cans and 64 lb. kegs.

"KENTUCKY RIFLE," in 1 lb. and 5 lb. canisters.

"KENTUCKY RIFLE," F.F.F.G. and F.F.G. and "SEA SHOOTING" FG in kegs of 25, 124, and 64 lbs. and canisters of 5 lbs.

Superior Mining and Blasting Powder.

The above well-known Gunpowders are supplied by the company's agents in every prominent city, and in the various mining districts of the United States and by all dealers in Guns and Sporting materials, or wholesale at the office of the Company,

88 Wall Street, New York.

Miscellaneous

DR. FOWLER'S PATENT
HARD RUBBER REEL.

"The Gem."

Imperishable, Light as a Feather, and
not Liable to Get Out of Order.

Numerous letters of recommendation have been received from the most experienced anglers in America, highly approving of this Reel, prominent among which are Mr. Seth Green and the Hon. Robt. Roosevelt.

This Reel, the latest contribution to the angler's outfit has now been before the public for one year, and we have yet to hear of the first complaint from the many hundreds who have used it.

door Games and Sports, containing 21 full page col-
ored engravings; also 150 plain cuts, together with
prices on all articles required. Price 10c.

GOODS SENT BY EXPRESS, C. O. D.

Apr 16 PECK & SNYDER, 126 Nassau St., N. Y.

This arm was submitted in competition with over
one hundred different systems, American and Euro-
pean, to the Board of United States Officers, appointed
by Act of Congress, 6th June, 1872, for the pur-
pose of selecting the best arm for the service, and of
which Brig. Gen. A. H. Terry was President. It suc-
cessfully passed through all the tests.

The following is the report of the Board:

"Resolved, That the adoption of magazine guns for
the military service by all nations is only a question
of time; that whenever an arm shall be devised which
shall be as effective as a single breech-loader, as the
best of the existing breech-loading arms, and shall at
the same time possess a safe and easily manipulated
magazine, every consideration of public policy will re-
quire its adoption.

"Resolved, further, That the experiments before the
Board with the Ward-Burton Magazine System have
so impressed the Board with the merits of this gun,
that they consider it as more nearly fulfilling the con-
ditions above specified than any other tried by them
or of which they have any knowledge, and it does
recommend that a number of magazine muskets be
made on the plan for further trial in the field." (See
Ordinance Report.)

We are now making these guns to supply the nu-
merous demands, and will soon have them in the
market.

The following is our scale of prices: Special Maga-
zine for large game, carrying from 3 to 8 cartridges,
70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
lbs. weight, from \$60 and upwards, according to finish.

Special Long-range Magazine Rifle for Creedmoor
shooting, 90 grs. of powder, 480 grs. of lead, carrying
3 to 8 cartridges, weighing 10 lbs., from \$100 and up-
ward. Magazine guns for general use, carrying 3 to
9 cartridges, 60 grs. powder, 350 grs. lead from \$40
and upward. Single Breech-Loader, Creedmoor
shooting, for long range, 90 grs. powder; 480 grs. lead,
from \$60 and upward. Single Breech-Loader for
general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
from \$30 and upward. The calibre of all our rifles,
unless otherwise ordered, will be 45-100. in.

NEW YORK STATE ASSOCIATION

FOR THE PRESERVATION OF

GAME AND FISH.

THE ANNUAL CONVENTION

of this Association will be held at

Oswego, N. Y.,

On or about the

FIRST WEEK IN JUNE, 1874,

Under the auspices of the

Leather Stocking Club

OF OSWEGO, N. Y.

It is proposed and expected that this meeting will eclipse all previous ones held in this State, both as regard to value of prizes and number of clubs partici-
pating.

A BENCH SHOW OF DOGS.

Will be held at the same time, under the direction of the State Association.

One day during the meeting will be devoted to

FLY CASTING & RIFLE SHOOTING.

The remainder of the week to shooting from the trap.

Sufficient wild pigeons have been secured to insure a fair trial to every person who may participate.

The magnificent hotel erected in Oswego by Mr. Doolittle, capable of accommodating 500 guests, will be opened June 1, 1874. The additional accommoda-
tion afforded by this hotel enables the Leather Stock-
ing Club to assure all visitors that ample accommoda-
tion for all can be procured at any time during the
meeting.

Circulars and other information concerning the
meeting will be cheerfully furnished on application to

J. F. MILLER,
Secretary Leather Stocking Club, Oswego, N. Y.

For Forest and Stream.
WHEN MY SHIP COMES HOME.

A YOUNG man stood by the summer sea,
In the flush of the rising sun,
And the wavelets gleamed as the light down streamed,
Gilding them one by one.

Over the waves with the tips of gold,
At the sun and the shining sea,
Like an eagle he gazed, with eye undazed,
And a soul all young and free.

"Youth and the world are mine!" he cried,
"Honor and hope and love;
Calm as the sea is my life to me,
And bright as the skies above.

"And the blue-eyed lass with the golden hair,
Who has given her heart to me;
Ah! she will be mine with her love divine,
When my ship comes over the sea."

An old man stood on a barren beach,
Shading his haggard eyes
With a hand that shook, while his weary look
Went from earth to sea and skies.

And never a one to pity him
Of all the friends of his youth,
For Hope was dead, and there lived instead
The sinister lesson, Truth.

And the gold-haired lass that had looked on him
With her eyes of heavenly blue,
Had gone, with his fame and riches and name,
As blue-eyed goddesses do.

Haggard and broken his shadow fell
Clouding the laughing foam;
Wrecked in the strife and storm of life,
His ship had never come home!

J. J. ROCHE.

Zoology of the North-Western
Territories.

THE OVIDÆ OF THE NORTH-WEST.

THE wild ovidæ of the continent of North America are confined to the Rocky Mountains and the region which extends westward from them to the Pacific Ocean, and even here they are comparatively scarce when contrasted with other animals which require more fostering care from nature to allow them to increase and become abundant. The species found in the north-west are limited to two, and they are, as a general rule, found among the crags, deep canyons and elevated mesas of mountains; it being a very rare occurrence to find any at a lower altitude than from three to five thousand feet. The variety most common is the Rocky Mountain sheep, (*Ovis montana*), and that is found from Wyoming to the California line, though it is more abundant in the northern territories than in the southern. It seems to be more common in the Klamath Basin, between California and Oregon, and the Blue Mountains traversing Idaho, Washington Territory and Oregon, than in any other portion of the Pacific Coast. It is but little hunted, owing to the difficulty of approaching it, for its vigilance is untiring; and also the hard labor of taking it away if killed, for none of the equine species can be taken into the regions frequented by this nimble and sure-footed animal. Its favorite habitat is the open, steep and rocky knolls and elevated crags where the delicate herbage it loves grows luxuriantly; and from this cause it requires much patience and perseverance in a hunter to follow it to a death shot, unless he should happen to steal upon it unawares—a feat difficult to accomplish.

Not over twenty perhaps have been killed in the north-west during the past two years, notwithstanding the fact that they are very common in certain localities, and that their flesh is said to be very palatable, superior in certain seasons to that of the domestic sheep. The Indians, to whom it is known by the name of *hyas mooto*, consider it equal to any meat they can procure; yet, they will not go in quest of it while small game is so abundant, for the latter, if not equal in flavor to the mutton, still, in their es-

timation, accomplishes the purpose of appeasing hunger equally well; therefore, they think it idle labor to satisfy an epicurean palate at the expense and toil of the whole body. When the noble *siwash* is confined to a reservation for a few years he becomes sybaritical and loses all love for even the chase, and this is probably the cause why he does not seek the lair of the American chamois and bring home the occupant as a proof of his perseverance and manhood. The few sheep killed are generally shot by the sporting pale face, for he will work night and day to enjoy the proud satisfaction of overcoming all obstacles and slaying an animal said to be the most vigilant on the continent. The best place that I have yet seen for hunting this sheep is near the Cascades of the Columbia Mountains. Small herds are found early in the morning and late in the evening, but in the middle of the day, few, if any, can be seen, as they secrete themselves among the rocks. It is stated that when feeding they will appoint one, generally a vigilant male, to mount guard on some elevated knoll, and when he sees any strange object approaching he sounds an alarm and all scamper off to the more elevated ridges at their best speed. When only one or two band together they also keep watch, and like the antelope, will raise their heads every few minutes to survey the landscape. Like all wild animals keen of scent, they will detect a man's presence half a mile off, should the wind blow from his direction; hence, if a shot is desired, one must always keep on their lee and approach them slowly and cautiously or they will be alarmed and fly at the first glimpse of the hunter. Shot me alarmed and fly at the first glimpse of the hunter, they would retreat to the mountain peaks be cut off, they would not hesitate a moment to leap from a crag and into an abyss below—one apparently deep enough to cause every one in their body to be shattered; yet, old hunters declare that they never saw one injured from the plunge, no matter how great. The cause for this immunity from danger is attributed to the horns, on which they alight, they being deemed to have the power of elasticity; hence, when a sheep falls on them, they cause it to rebound to its feet immediately and none the worse for the concussion. These useful appendages are also said to be employed for climbing boulders and all steep ascents. When the animal finds that it cannot secure a foothold it will, it is so stated by Nimrods, place the points of its curved horns in the earth or crevice of rock and hang by them until it can plant itself firmly preparatory to a further advance. The horns are certainly strong enough to hold many times the weight of the creature bearing them, and their blunted and broken tips would add to the probability of the tale.

The appearance and characteristics of this species of the ovidæ are very different from those of the domestic; in fact, were it not for the outlines of the face, one would rather classify it with the capridæ, or goat family. It is much taller and longer than the largest of the domestic variety, the cauda is shorter, the neck thicker, and instead of wool it has coarse tubular hair of a yellowish brown color, which changes to a white nuchal patch at the flanks, bifurcating behind. A narrow streak of white decks the posterior side of the fore and hind legs, while the anterior is of the same hue as the body. The horns, which are very heavy at the base and close together, curve backward and forward and terminate at a small point. They are placed directly over the eyes and this gives the head a stunted appearance. The face is rather narrow, the eyes are large and full, the nostrils are very broad, the neck is short and stout, intended undoubtedly for the large horns which it bears; while the legs are long and tapering and strongly indicative of sinew and speed. The body is round and quite broad, and so far as graceful outline is concerned, is far superior to that of the domestic species. Unlike the latter, also, its congener will fight any ordinary foe, and make a brave struggle against wolf or fox in defence of its young. In these contests the heavy horns are used with terrible power on the ribs of the conscienceless carnivora, and he is often compelled to retreat without having accomplished anything than receiving a sound pummeling. This animal brings forth its young in May or early in June, the number varying from one to two, but the former is the average.

The lambkins are well able to look after their provender in a couple of weeks after seeing the sunlight; yet, the mother will remain with them from three to six months, according to locality and possibility of escape from dogs and hunters. To give our readers an idea of the mountain sheep I made the following measurement of one recently captured:—

Length from base of horns to cauda, 44 inches; height, 34 inches; horns along curve, 29 inches; horns width from tip to tip, 26 inches; face from horns to tip of nose, 10 inches.

The cauda, which was not more than an inch in length, had an upward curve, and its hirsute covering was a sort of yellowish-white. The animal was a model of speed and strength, but it seemed devoid of much intelligence; it certainly had none of that gravity so peculiar to the male of the domestic *ovus*.

The only animal allied to this found in the north-west is the Rocky Mountain goat, (*aplocerus montana*), and that I have classified in the opening of this article as belonging to, or rather being allied to the ovidæ; so to be literal now I shall refer to it as the capridæ. This active climber and daring leaper is said to inhabit the Cascade range from the northern portion of California to British Columbia, and to follow the more elevated ridges from the Rocky Mountains to Southern Idaho. Very little is known of its habits, as its Alpine resort protects it from the rifle of the hunter and the attack of carnivorous scientists. My knowledge of it is confined to descriptions received from Indians and one or two hunters; and as their imagination is always vivid, I hardly know whether to believe what I have heard or not. Some tales of course are apocryphal, especially those of the pale faces, as for instance, that one among many, where they aver that a goat will leap down a precipice of 1,000 feet, strike on a rock on its horns, rebound to its feet, then leap to another, and so continue its jumping until it reaches a place of safety!

Another anecdote is that a goat will die by suicide rather than allow itself to be shot by man; and also that when it reaches a place of safety no amount of shooting or yelling will frighten it away, as it then apparently knows that it is secure from all danger, so bids defiance to empty fusillades. It is, according to tales, more cunning and daring than the Alpine chamois, and also better for the table, as it finds an abundance of herbage at all seasons; in the summer among the crags near the snow line; in the winter among the coniferous forests, which extend to the line of perpetual snow. The Indians of Walla Walla, to whom this animal is known as the *wow*, state that it is entirely white, has long pendant hair and a large tuft or beard on the chin. The land which it frequented when known to them is now trodden by herds of domestic cattle, and that like all other animals in a state of nature, has been compelled to flee before civilization. Those tourists who flock to Europe to loiter away their time chamois hunting, could do much better by staying at home, especially, if fond of field sports, for they can find in the north-west animals which are unknown to science, or at most but very little; and to make the world acquainted with these should certainly prove interesting to those who have knowledge sufficient and the leisure to prosecute such inquiries. They would then accomplish two useful purposes—namely, secure bounding health and vigorous pleasure for themselves, and furnish to the world a species of information concerning the strange animals of this continent which it would gladly know. I think that if your influential journal were to call the attention of tourists to the broad field open to them throughout the north-west, many secrets of the habits and characteristics of its flora and fauna would be made known and science thereby enriched. It is my intention in a week or two to start on a hunt among these nimble-footed creatures, the goats and sheep; and if I am fortunate enough to get within watching distance of them, I shall furnish you notes of my experience.

MORTIMER KERRY.

—Put on your right glove first, stupid. Then you have your left hand ungloved to button your right withal. If you put on your left glove first you have to button your right glove under double disadvantage.

For Forest and Stream.

BROWN, JONES AND ROBINSON'S HUNT

NO one enjoys field sport so much as a man who is engaged in active business, and who once in a while steals a day, and with gun or rod tramps the woods and fields, or saunters along the trout brooks. The entire change and absence from dull routine makes the "being out" a treat, even if game is scarce and one's bag or basket looks as though an "elephant had stepped on it," as an impecunious Bohemian has expressed it in regard to his purse. Often has your humble servant started at daylight, walked all day, and at night when ravenously devouring the meal thoughtfully "kept" for him, in answer to the fond inquiry of his better half as to what luck, answered "splendid," with no doubt as to the strict accuracy of the fact until some thoughtless suggestion of said better half as to the uselessness of calling upon the butcher the next morning, has obliged him to reconsider the matter carefully and sadly acknowledge that one snipe, two woodcocks or perhaps a pair of squirrels would not be sufficient to satisfy the appetites of even a small family. There is always a quiet smile on the face of my wife when I state my purpose of going shooting, that I thoroughly understand; it implies that there are no great anticipations of game dinners to follow. The exception, which happens once in a while, is the more enjoyable.

The ardor is never abated, however, else how could one, as we did, deliberately persuade two brother enthusiasts that the "marshes" were swarming with wild ducks, and that our respective families and friends would have cause to remember us long for favors in the way of red heads, blue bills, widgeons, whistlers, &c., &c., if only we carried cartridges enough.

The day was set, and that genial and thorough sportsman, Brown, who has hunted moose in Nova Scotia, caribou in the backwoods of Canada and deer in the Adirondacks, a young college student, Jones, full of anticipations, but somewhat inexperienced, as is proven by the fact of his wearing on the trip French calf-skin gaiters instead of rubber boots, and myself, Robinson, after getting all the necessary traps together, including a box of thirty-two decoy ducks, appeared at the railroad depot "armed and equipped," as the law directs.

To the sarcastic baggageman who innocently asked if he should secure an extra wagon to carry home the game on our return, we quietly smiled, and his delicate satire slid from our backs like the rain drops from a goose, (which, by the way, is not an inappropriate simile.)

The place to which we were bound, although on the line of railroad, is distant about four miles from a regular station, but having heard that a certain hermit flagman had a shanty directly on the hunting grounds where we could stay, with two or three good boats, and that an affable "sporting" conductor would kindly "slow up" and let us off, we based our plans accordingly.

Off we are at last in fine feather. Mr. Conductor appears—our wishes to stop are stated—he frowns and simply remarks: "Can't do it," and berates us soundly while punching our duplex tickets, for entertaining such an absurdity. Here is a quandary. We well know that there is no wagon road from the station to the marsh, and our backs fairly ache at the mere possibility of having to carry that great box of decoys four miles on the railroad track. We hand over our fare to the implacable official and silently smoke. At the first stopping place get out and moodily examine the train that "won't stop," and think of the many times that a "hot journal" has brought us up, when in a hurry to get to our destination, and seriously think of opening one of the iron boxes and deliberately emptying cotton waste and oil, and make it hot for said journal at about the hunting ground and get those wicked decoys and cartridges off while things are cooling. While these thoughts are floating through our brain we hear a cheery voice, "Hallo Robinson, where are you going?" and upon taking a good look recognize an old friend in the person of the engineer. We at once tell him where we want to go and how we can't. He immediately puts a new phase upon matters by saying: "Get the things all ready and we will slack up enough to let you off." We on the spot ask the street and the number of his house, and warn him that half a dozen of the best ducks that swim will be found there with our compliments immediately on our return. He looks very much as did the baggageman, but considerably says nothing, his faith evidently was greater, perhaps so much "as a grain of mustard seed."

The train duly slacked up and Brown in his hurry to get off, and forgetting the philosophy of jumping from a running body, rolls over and over with gun, game bag and other traps, sometimes on top and sometimes the reverse, finally fetching up on his feet smiling and good-natured as he always is, brushes the dust from his clothes and nimbly limps to help the collegiate Jones get out those thirty-two decoys.

With a parting wave of the hand from the clever engineer the train moves off, and we survey the surroundings. First, a large lake, evidently much above the usual water mark, for the familiar flags and rushes that make it usually a marsh, are all covered, suggesting doubts at once as to our ability to get within half a mile of the thirty-two decoys when set out on the feeding grounds, but a flock of about a dozen ducks passing overhead at about the altitude of Mount Washington, throws our fears to the winds, and not doubting but that we can circumvent the game some way, we secondly observe the hotel which is destined to lodge and feed us. We dub it immediately the "Fifth Avenue," and knowing that a certain apparent familiarity with the landlord often secures the best the house affords, greet the proprietor who is advancing towards us with a cheerful "Hallo, Uncle John," and proposed the question, "Can you give us boats, something to eat and a place to sleep?" He quietly answers, "We'll see," and leads the way loaded down with our guns and baggage to the hotel. We find our host is the flagman guarding the railroad bridge; his house consists of the usual switchman's box shanty, only somewhat larger, and divided into two compartments, each about six by seven, the one containing a cook stove, a portable shelf, which we find is used as a dining table, a wooden bench, and the other a bed; all neat, cozy and comfortable enough for enthusiastic sportsmen. All this he says we can have, hold and enjoy, unless two other gentlemen, at present guests of his, should decide to remain another night, but as he further states that they have signified their intention of leaving during the day, we give ourselves no uneasiness. The only other shelter in sight is a steam-dredge anchored on the opposite shore across the bridge, and an old baggage car stranded by the side of the track.

When we left home the weather was wild and comfortable, but with the perversity of April had suddenly changed and a cold and penetrating north-west wind was blowing strong. We gathered around the cook stove and munched a lunch of cold meat, crackers and cheese that the provident and experienced Brown had brought along, preparatory to making a raid on the fated ducks whose brethren we had noticed a few minutes before.

Shortly Uncle John informed us our boats were ready, and although the wind had increased to a perfect rale Jones and myself proposed to start. The courteous Brown said he would wait until it calmed down a little and then follow us. So pitying somewhat his lack of enthusiasm off we went, straining every muscle, the water falling in sprays around us from the numerous "crabs" caught by our oars.

After working long and not seeing any perceptible increase of distance between the boat and shore, we began to have serious doubts as to the wisdom of our proceeding instead of waiting with our friend until it calmed down, but the sight of another flock of ducks passing overhead added new strength to our arms and fortified our wavering resolution. We called to Jones and bade him not give up but follow us and we would soon be "amongst them."

Our destination was a point jutting out into the water about a mile from the shanty, where we had been advised was "just the place to slaughter them." We pulled and pulled, and after more physical exertion than would take to keep a small family in fire-wood for a long winter, reached the "point." No place to hide, the water was so high that the rushes were entirely covered, and as ducks have an insuperable objection to coming within gun shot of an open boat, our chances looked slim. However, we had reached the place where the slaughtering was in the bill to go on, and go back we would not until we had made an effort. So after a short council of war we decided to set out our decoys and proceed to business. Oh, the work of setting those wretched things! but it was finally accomplished, and we then worked ourselves up to the beach and pulled the boats behind a clump of bare bushes, which, for all purposes of concealment probably might have deceived a blind duck, but certainly nothing else. We were somewhat warm after our exertions, and now being compelled to keep quiet, and exposed, as we were, to the cutting wind, our teeth soon commenced to chatter and our bodies to shiver—and to add to our vexation, we noticed that most of our decoys were upside down; it blew so strong that it had toppled six or eight of them over, and their remaining brethren were evidently on the point of following suit. The utter absurdity of our position put us in good humor; the mere idea of a duck ever daring to come within range of us was preposterous. Still, with the confidence only given to a non-professional sportsman, we waited, fondly hoping that some lunatic blue-bill would drop down to us from one of the stray flocks that at long intervals passed high above us. In the meantime nothing had been seen or heard of Brown, as there were no signs of its "calming down." We agreed he must have remained behind hugging the shore; but, to be sure that he was not stranded somewhere on the marsh, we determined, being nearly stiffened by this time with cold, to pull up and take a row down the shore and see if we could get any track of him, and at least get warm. After cautiously rowing along for about half a mile we came in sight of another lot of decoys having the same intoxicated appearance that ours had shown. We drifted down upon them, but no one could we see till finally our perplexity was ended by hearing a shivering voice away back in the woods on the shore hailing us, which we recognized as Brown's. The poor fellow was tramping up and down swinging his arms, almost frozen. We joined him as soon as possible and had a general laugh over our drunken decoys and our misfortunes well to explore. As we couldn't shoot we thought it might be, in short, proved a very satisfactory land excursion, which, as we all got somewhat warmed up, and immediately as I of all the party had the first and only shot at a wild duck during the trip. "Mark," says Brown, "there comes a flock directly for us," and sure enough it was so, only they were at such a height as to make it problematical whether or not a rifle ball could have reached them. Still I gave them a barrel as they went over. Not seeing anything fall we quietly took our way to the shore, calmly pulled out and took up those wretched decoys and started for Uncle John's. Upon reaching the house we noticed two men in corduroys. We experienced a shock, our "prophetic souls" told us they were the persons who were to have gone, and they hadn't, and so it proved. They had the priority, and where was our lodging to come in? It was apparent that but two could occupy the bed and we might perhaps curl around the stove—quarters for three and we were five; and more than all we were faint with hunger, and our empty stomachs were aching for food.

"Boys," says Uncle John, breaking in upon our gloomy thought, "go over to the dredge and get your supper; there is a family living there and I have made arrangements for them to feed you," and he added, "come back and I'll find a place for you to sleep." This was cheerful news, and off we started over the railroad trestle-bridge for the steam dredge we had noticed in the morning; a smoking repast of broiled ham and boiled potatoes was soon set before us, and any hunter will understand how good it tasted and how much of it we put out of sight.

Supper finished, we retraced our steps over the perilous trestle work; it was bad enough by daylight but now it was dark, and of course more dangerous. We momentarily expected a train would come along and force us to take refuge on one of the piers, but fortunately nothing of the kind occurred, and we reached our "Fifth Avenue Hotel" in safety and at once claimed Uncle John's promise to see us taken care of for the night, although how he was to do it was a problem intricate enough for us. We saw no way to arrange matters, but to adopt the rule followed by the Irish trappers who succeeded by will to their father's house, "One take the inside and the other the outside." We were not forced, however, to this cold alternative; it seems the old baggage car spoken of before had been fitted up with some degree of comfort by a party of gentlemen, who, probably at some previous time, had found the "Hotel" crowded from top to bottom by a previous arrival, and were obliged to endure the discomforts we were threatened with; and under the circumstances, Uncle John, who had the key, said we might occupy it for the night. After inspecting our quarters, which we found contained a stove and bunks to sleep upon, we adjourned to the shanty and soon struck up an acquaintance with the other sportsmen, whose "not going" had so nearly proved our ruin, and although the accommodations were limited, a merry evening was passed. Hunting stories, always most interesting,

wonderful escapes by field and flood were narrated, and these, together with our pipes, made the hours pass quickly until it came time to turn in.

Uncle John had started a fire in the stove, and the old car was nicely warmed. After showing us where to find fuel to keep it going he left us with his blessings. We locked the door, and stretching ourselves, were soon asleep. Instead of taking proper care of the fire it was entirely neglected, and of course went out, and as a necessary sequence we began to grow cold, and shortly the temperature became unendurable. Jones, who went to bed with wet feet, he having got over his gaiters in a water hole nearly five inches deep, and whose bed-clothes consisted only of an old car cushion, gave out first and declared he "might as well attempt to keep warm covered with a hemlock board," and started for the door to get out; but lo! the lock had some way become broken, and it was impossible to turn the key. Here was a pretty state of affairs, the thermometer, (if we had one,) kept going down. Jones sat on the stove, where some lingering degree of heat still remained, but soon that was gone. We walked back and forth, stamped and shouted "fit to raise the dead," until we succeeded in attracting the attention of Uncle John. A screw-driver was passed in to us, the lock was soon removed and we were free once more. We huddled around the stove in his "shanty," and thawed out for this probably the tenth time. After all these perils we decided the marshes was no place for us, and learning that a hand-car would shortly be along on its way to the next station, we determined to have our traps sent on by it, while we would foot it along the track and take the first train for home.

Here was where Jones' light gaiters proved themselves valuable, and Brown and I, with our heavy top-boots stumbling along, envied our light-footed friend. So we left the ducks, having inflicted damages upon them in about the same way John Phoenix did upon his adversary. The sarcastic baggageman said nothing, evidently being good enough judge of human nature to keep quiet, but the clever engineer received at once his brace of ducks, they being the best that could be bought in the market. We are all in good spirits, and undoubtedly will take lots of the same kind of trips, each time starting off with undiminished enthusiasm.

For Forest and Stream.

LONG RANGE RIFLE PRACTICE.

EVERY one who has had much experience in long range shooting must have found that next to a steady hand and a true eye everything depends upon good judgment as to the allowances to be made for elevation and windage. I speak from personal observation when I say that the superiority of our best shots depends very much upon their careful attention to these particulars.

In one of your late issues you direct attention to a remark made by Beaton, which made a great impression on me at the time when I read his book. It is now some years since, but I believe I am correct in stating that he affirms that at 400 yards an object will vary in its apparent elevation to the extent of four feet. It should be borne in mind, then, that the target is rarely exactly situated where it appears to be, but on the contrary will seem to vary its height from day to day, or even during the same day, in consequence of varying conditions of light and shade, of humidity and dryness, of heat and cold.

I can call to mind some striking instances of sudden variation. One I will mention to illustrate my statement. Our club had been practicing one afternoon, and had been making excellent shooting up to 500 yards. The day had been dull and the sky overcast, when suddenly a sharp thunder storm came up, which drove away the majority of the club. It was soon over, however, and when the sun came out bright and clear five or six of us resumed our practice. Up to this time we had been making bulls eyes or centres, but afterwards each of us fired three rounds without one shot striking even the target, and before we found out that all the fifteen or sixteen had struck just below it, and had penetrated the soft earth below without giving any sign, corresponding elevations of sights at once enabled us to return to bulls eyes and centres.

A rifle may then be ranged to any given long range for what may be called average atmosphere, but may still require considerable allowance to meet daily, or even hourly, atmospheric changes; and, moreover, what may be considered an average for one locality or country may require modification to adopt it to another locality or country. Knowing these facts, it seems strange that no systematic attempt has hitherto been made, so far as I know, to reduce them to some precise, I might say to some scientific, basis. Knowing ones have a sort of "rule of thumb" to guide them, but these shrewd guesses they keep to themselves, lest by communicating them to competitors they should lose some advantage, and rifle clubs have generally prevented the diffusion of such shrewd guesses by offering annual prizes for the highest aggregate scores made during the season, instead of bringing all the experience which each individual might contribute to the determination of the question, What variations of elevation are required by varying atmospheric conditions?

The same result applies to the question of lateral deviations or windage. More or less accurate guesses are made according to each individual's sagacity, while no advantage has been taken of the scientific apparatus which has long been in use for estimating the force of the wind, so as to educate the rifleman to a correct estimation of its effects in rifle practice.

I hope I have made sufficiently clear the necessity of the adoption of some means to reduce rifle shooting to some scientific, practical basis, and if so I would point out the plan which I think would conduce to this desirable result.

In the first place, it follows that in order to insure uniformity the members of each club should be armed with rifles of the same, or nearly the same, trajectory.

Second. All prizes for annual aggregate scores should be abolished, so as to take away all incentive to concealment of knowledge.

Third. On every club ground there should be erected some stationary apparatus (which need not be expensive or elaborate, however,) at a moderately long range, say at 500 yards, which should be trained by observation on the centre of the target for average atmospheric conditions.

Fourth. Before commencing practice each day, the atmospheric conditions should be carefully noted, along with the position of the ground and the direction on the compass of the range, and also the apparent deviations from the average elevation as shown by the stationary sighting apparatus in some properly arranged register.

Fifth. Each member should then be required to make

the same allowance on his vernier sight for such apparent deviation, and the result of the shots of all the members for that round be carefully recorded. The result would show whether the proper allowance had been made, and if not, subsequent rounds, conducted as before, would show what corrections are required.

Sixth. Any changes occurring during any day, either in the atmospheric conditions or in the club practice, should be carefully noted, so as to ascertain the causes which may require modification of elevation.

Seventh. For the purpose of educating the members of the club to a correct estimate of the wind force, a wind gauge should also be erected on the club ground, and the force of the wind from time to time recorded, with its direction as to the range. The same lateral allowance should be made by each member on the scale of the muzzle sight, and the corrections required ascertained by the results of each round.

Eighth. Every shot should be made under the directions of some competent captain, who should have absolute authority over the sighting of each member of the club, so as to insure uniformity.

To some this may seem utopian, but I am confident that rifle shooting will never attain, as it ought and may, to the dignity of a science until some such plan is adopted, and the club of gentlemen who will inaugurate some such system will secure for itself the pre-eminence of not only obtaining the highest superiority of success, but also of being the first to contribute the elements of scientific accuracy to the fascinating and useful recreation of rifle shooting. My views may be crude, but I will have obtained my object if I have stimulated others to the development of some more feasible plan. J.H.R.

For Forest and Stream.

BLUE FISHING.

I PROPOSE referring to an accessible point on the New Jersey coast, where this exciting amusement can be enjoyed *ad libitum*. Many are fond of fishing, and in my opinion they lose the cream of the joke unless they engage in blue fishing where these voracious customers exist in great numbers. I am an old piscator, and when I wish to enjoy perfect piscatorial happiness, I telegraph that prince of boatmen, Capt. Joel Ridgway, of Barnegat, "that I am coming, be ready." The Captain meets me at the depot at 10 o'clock A. M., and at 12 o'clock M. I have my squids towing astern, and as a general rule am soon engaged in capturing the struggling, fighting and snappish denizens of the deep.

Several years since, the sickness of a friend induced me to visit Barnegat, and I discovered that it was a piscatorial paradise, if accessibility, number of fish, and superiority of boats, are taken into consideration. Barnegat Bay is over forty miles in length, and from one fourth to seven miles in width, extending from Little Egg Harbor to a point north of Toms River. The main entrance to the bay is Barnegat inlet, distant from the village of that name about seven miles.

Many of the residents of the locality make a livelihood by fishing with hook and line, and in consequence guard the interest with jealous care. At Cape May, Atlantic City, Egg Harbor, and New York, rod and line fishing is injured by seines and fike nets. On several occasions New York fishermen visited the locality, with the intention of prosecuting their calling, but soon realized the fact that a sword fish or other varmint, had produced extensive solutions of continuity in their nets. Finding more nets to mend than marketable fish entrapped, they retired in disgust. Owing to the protection extended to the fish, the bay is worth a visit to those who can appreciate rod or squid fishing.

After the first of July weakfish of a very large size are very plentiful, and sheephead, sea bass, black-fish, porgies, and flounders can be captured. After the first of September the bass fisher may enjoy excellent sport. But the great attraction of Barnegat for "Al Fresco" and his friends is the blue fishing; and he fancies that it can not be excelled by any point within one hundred miles of New York.

About the 20th of May, the run of large blue fish on their way north, enter the bay in great numbers, and remain from ten to fourteen days, or as long as they can find food. They are followed by a smaller run known as "summer fish" or "snap mackerel," varying from one to four pounds, and they remain in the bay or about the entrance until the beginning of September. The large fish commence their migration south about that time, and excellent squidding can be obtained outside the bar.

But to illustrate the character of the sport at Barnegat, I will give your readers a little of my experience within a recent period. In the beginning of July 1872, an artist friend and your correspondent, landed between 10 A. M. and 3 P. M., fifty-three fish ranging from two to four pounds. Two weeks later found me on the bay, in company with six friends. Until noon we amused ourselves catching weak and king fish; and by 4 P. M. we captured one hundred and seventy varying from one to three pounds. We started for the landing and found that the days catch numbered seven hundred and thirty-six fish.

The second week in August again found me at Barnegat in company with S. We caught between 9 A. M. and 4 P. M. one hundred and forty-three blue-fish, from two to four pounds. During the last hour with three squids towing astern, we landed sixty-two, or over one per minute.

On the 20th of May 1873 I received a telegram to the following effect. "Blue-fish plenty, come." I at once communicated with a dominie—an ex-city missionary, and we took the first train for Barnegat where we arrived at 6 P. M. At the depot we were welcomed by the sight of the scaly sides of one hundred and twenty large blue-fish which had been caught in the bay, in two hours, by two fishermen. During the night a cold north-easter with rain set in, and the next morning at 6 A. M. we were afloat and squidding in a cold and disagreeable rain storm. Owing to the storm, respect to the dominie's fingers, or the fear of a learned disquisition on the eleventh commandment, during the night the fish took their departure. We squidded for two days and captured three fish averaging about three pounds; and becoming disgusted with the rain, and want of success, started for home. The ensuing day, the weather cleared up; the fish returned in immense quantities and remained in the bay for two weeks.

July again found me on the bay in company with O. At 2 P. M. on Thursday we found fingers sore and muscles tired, and through sheer weariness abandoned the sport. Turning the bow of the boat towards the landing, we counted our catch and found that we had captured one hundred and eighty-two blue-fish weighing about seven

hundred pounds. Next morning at 6 A. M. our squids were towing astern, and we were busily engaged hauling in and unhooking fish. 9 A. M. found my fingers tender, and the hands of O. so swollen that he found it impossible to haul in another fish. Tired, crippled, and demoralized, we resolved on a change of base, and started for the cool verandah at Cranmer's hotel. We took an account of stock and found that we had captured in three hours one hundred and eighteen fish ranging from two to four pounds.

August again found me squidding with S. The first day we caught one hundred; and the succeeding one hundred and five, abandoning the sport early each day for the purpose of engaging in weak fishing. The third day we passed out at Barnegat inlet, and cruised outside to Little Egg Harbor inlet a distance of twenty miles, and returned by the inside, or bay route. During our outside cruise we caught a fine Spanish mackerel and two sharks.

On the morning of September 6th at 9.30 A. M. I found myself outside the bar in company with D., M., and R. The action commenced immediately and continued until 8.15 A. M. At 7, R. quarrelled with Old Neptune, and inaugurated a disgorging process. Not having sufficient strength left to haul in ten-pounders, he took possession of a corner of the boat and remained quiescent. D. suddenly contracted a severe headache accompanied with general prostration (but asserted that he was "not sea sick," and had not sufficient strength left to land a fish, so he stowed himself away. M. had always ridiculed the idea of protecting his thumb and fingers with India rubber finger stalls, and soon found himself *hors de combat*, in consequence of his fingers being severely cut by the line. Being in company with invalids, I was forced to beat a retreat, and headed the boat for Barnegat. I counted stock on hand and found that we had captured in less than two hours sixty-eight fish weighing about eight hundred pounds. Fair sport when the demoralized condition of a portion of the crew is considered. We accompanied D. and R. to the depot, and M. and I proceeded to the inlet. Having awning, store and cooking fixings we camped out for the night. Sunday morning arriving and no church nearer than Barnegat, we resolved to while away the time by taking a cruise outside. We passed the bar, and when we attained a point about two miles from the beach we found ourselves surrounded by a very large run of blue-fish. As far as the eye could reach, in every direction, they were breaking water—in fact, the ocean was literally alive with fish. I have circumnavigated the globe, and have sailed over many oceans, but never witnessed anything to equal the condition of things around us. In every direction the surface was disturbed by fish, and on looking over the side of the boat they could be seen passing under her in hundreds. Here was temptation, but regard for the day deterred us from engaging in the capture of the voracious and snappish customers. We required fresh fish for dinner, and as food was a necessity a squid was thrown overboard, and it barely touched the water before a ten-pounder was hooked. The next morning (Monday) we were disposed to capture a few hundred of these plucky gents, but a heavy north-east wind had set in during the night, and the sea was so high on the bar the Captain would not attempt to cross it.

Trout, pickerel, mascalonge, bass, and salmon fishing have charms, but to those who have never enjoyed the excitement of blue fishing, we can say that it is the quintessence of sport. With plenty of hungry fish around you, a six knot breeze, a safe boat, a good captain, and three squids towing astern, every minute is one of excitement and piscatorial pleasure. When fish are plentiful and in a biting mood, it is almost impossible for two active men to attend to three lines and keep them clear of fish. Unless prevented by sickness, we expect to visit Barnegat during the summer, and if you think it would interest your readers we shall take pleasure in keeping them posted.

Barnegat is very accessible from New York or Philadelphia—excursion ticket about three dollars. By taking the first train of the New Jersey Southern R. R. from New York or Philadelphia, Barnegat can be reached at 10 A. M., or by taking the afternoon train at 6 P. M. By providing a lunch, and engaging a boat beforehand a fair day's sport can be obtained the first day. Fair accommodations can be obtained at Cranmer's hotel at Barnegat, or at the Kensey's Inlet House near the light house.

Boats at Barnegat are of a superior class as regards size, speed, and safety, and the captains are gentlemanly, attentive, sober and industrious. The price of a first-class boat with captain is \$4. per day. All of the boatmen are reliable, but we can unhesitatingly recommend either Joel, Joseph, or Jarvis Ridgway—more especially that prince of sailors Captain Joel Ridgway. Persons intending to visit Barnegat, can secure a boat by addressing Captain Joel Ridgway, Barnegat, Ocean county, N. Y., stating day and train by which they will arrive at the village, and if he is engaged, he will secure the services of a reliable substitute, who will be on hand when the whistle sounds "down brakes."

During the ensuing summer, I propose trying the artificial fly, in blue fishing, and have reason to believe that some excellent sport can be obtained. As a lover of blue fishing, I regret the imperfect manner in which squids are constructed by those who manufacture them. As many persons indulge in this description of sport, it is to be hoped that some one who is posted will describe lines and squids best adapted to this kind of fishing.

One thing calculated to recommend Barnegat to fishermen, and those who seek the sea side for relaxation, is the fact that the conventionalities of sea side resorts have not afflicted and poisoned the atmosphere of the locality. The fisherman, or visitor, can dress as he pleases without offending others—ventilating shoes, flannel shirts, fifteen cent hats, and the absence of coats being the fashion. Boarding is \$2 per day, boat \$4, the place is accessible, bathing unequalled, and the fisherman can engage in the exciting sport of landing blue-fish, the monotonous occupation of sheepheading, or the tame sport of catching weakfish, black-fish and flounders.

AL FRESCO.

For Forest and Stream.

THE MONGOOSE AND THE COBRA.

SOME years ago, while temporarily the guest of a Boston gentleman connected with a mercantile house in Singapore, I derived a great deal of amusement from watching the movements of a pet mongoose, which ran at large in his rooms. This little animal, peculiar to the East Indies, was about half the size of a raccoon, and not greatly unlike one in its build and habits. Constantly on the move, and restless, it would go around and around the room, its little, sharp black eyes peering into every nook and cranny, and its pointed nose twitching in every direction. Occa-

sionally it would come silently up to its master, and arching its back rub to and fro against his legs, as if, like a cat, seeking notice. A caress or two seemed to satisfy it, and it would resume its search, for searching I believe it was.

The mongoose is the natural enemy of reptiles of all descriptions, and devotes itself to their extirpation, a self-imposed duty, compared to which the labors of St. Patrick were but a bagatelle, for surely Ireland, in its palmyest snake days, could not have compared with India in even its poorest day for snakes. D— had made a great pet of his mongoose, was greatly attached to it, and it seemed to fully return his affection. It would scramble up into his lap, and seem to enjoy a little caressing, but was soon tired of it. It was not treacherous, although at times it would develop a little quick temper when teased, but would soon forget its anger. Before their acquaintance had ripened into friendship, the mongoose had two or three times bitten my friend, but beyond the temporary pain and annoyance of a slight flesh wound no evil consequences had ensued.

One morning D— came into possession of a fair sized cobra de capello, buying it, I believe, from an itinerant snake charmer. The cobra, or "hood viper," is probably one of the most venomous of the serpent family. Whiskey may cure the bite of a rattlesnake, but the poison of a cobra's bite would be beyond the power of even "Injun whiskey" to counteract. D— cleared his room for action, retaining some of the *highest* articles of furniture as "reserved seats" in the approaching meeting of the gladiators that he was anticipating. The basket containing the cobra was placed on the floor, and, by means of a cord, capsized, thus releasing the snake, which, seeing no antagonist near, began sliding about the floor, looking for escape. The mongoose, by intention, was on the other side of the room when the snake was released, pursuing its customary investigations. Almost immediately it perceived the snake, and, arching its back, with eyes gleaming at the reptile, it became momentarily rigid, then slowly, with cat-like softness of step, moved towards it. Quicker than a flash, from trailing its yard of hideous, gorgeous flesh upon the floor, the cobra sprang into an attitude for combat, and from a coil for base reared its pointed head, with expanded hood, and eyes sparkling with rage, nearly half its length above the floor, then with head pointed at its foe, tongue darting at intervals from its horrid mouth, and hissing with excitement, it stood prepared for the fray. The mongoose slowly approached, until he had reached a point just beyond the striking distance of the snake, then paused a moment, then darted through the air like a shot from a gun. There was a momentary struggle, over almost before it began; the snake struck as the animal sprang, but the mongoose stood in safety on the other side, and on each side of the swollen crest of the viper were two jagged wounds, from whence the blood was trickling. Again and again was this repeated. By his judgment and agility the mongoose escaped a touch, while after each assault the serpent seemed to lose courage and strength, and new wounds were visible, until at last, subdued and crestfallen, it no longer retained its erect and defiant posture, but lying prone upon the floor sought only to avoid attack; but without avail. Steadfast and merciless, the animal followed up its victory, and in a short time had nearly torn from its body the head of the unfortunate reptile, and death soon put an end to its struggles. The mongoose manifested no desire to devour its late antagonist, but sought to leave the apartment. D— called to it, but it would not obey him, and seemed to be in an unnatural state of excitement, its eyes having a very peculiar, greenish, glassy stare. D— attempted to pick it up, but crazed it turned upon him and fastened its teeth in his hand. He dropped it, and the door having been opened the animal ran out, and disappeared for a day or two, after which it returned in its usual health and humor. My friend, though, did not fare so well. The little wound upon his hand rapidly assumed most alarming symptoms; the hand and arm to the shoulder became swollen to twice their natural size, discolored spots made their appearance, high fever and other bodily derangements set in, and for many days his life hung in a trembling balance. All of the symptoms caused by a cobra bite, although not to the extreme degree, followed the bite of the mongoose, and I afterwards learned that his health had been so shattered by this illness that he had been forced to leave the Indies.

The natives said that the mongoose, after killing a cobra, is crazy until it has eaten of some root or herb which it seeks, and which has the power of an antidote even in the case of a bite. What herb or root this is they did not profess to know. I have seen used by a Hindostan snake charmer woman, in Bombay, a root which is possibly the one sought by the mongoose. In this case the woman, having placed upon the ground, near a verandah where a number of us were sitting in the shade, a deep narrow basket, made a collection from us of a few shillings, then, lifting her basket with a jerk, an immense cobra fell from it, which instantly threw itself into a coil and erected its head; the woman, squatting before it, passed her hand with a graceful, sweeping, horizontal figure of ∞ motion to and fro in front of it, at the same time making a peculiar, monotonous, buzzing, humming sound, the snake's head following every sweep and motion of her hand; the instant she would interrupt the sound, and cease the waving motion, the snake, which had become very angry, would strike at her. Each blow she received on the elbow, which, with nearly the whole of her arm, was enveloped in many folds of cloth, and immediately resume the motion and sound, and the cobra's head would follow as before. Presently, when the snake became very angry, she caused it to strike a dozen times in rapid succession, which blows she dodged, then quickly putting into her right hand from her left, where it had been concealed, what looked like a bit of stick, she fearlessly shook the covering from her arm, and thrust her hand holding the stick towards the serpent. In an instant its whole demeanor changed; its expanded hood contracted, and it lowered its head, on which she placed her hand and pressed it to the ground, where it lay in abject submission while she replaced the basket over it.

This may have been a trick, the snake may have been taught, or its fangs broken off, but to us on the spot (some old East Indians were among us), capable of a fair judgment, it looked real. I examined the stick—"snake root," the English residents call it. It was about two inches long, and resembled very much an ordinary sweet flag, except that there were diamond-shaped marks on it. The woman refused a pound sterling for the piece she had, and I have no doubt but that this root, like witch hazel in England, is obnoxious to snakes.

PISCO.

THE COMING OF SPRING.

BY ROBERT. LORD LYTTON. (OWEN MEREDITH.)

THE green grass blades aquiver
With joy at the dawn of day
(For the most inquisitive ever
Of the flowers of the field are they).
Lisp'd it low to their lazy
Neighbors that flat on the ground,
Dandelion and daisy,
Lay still in slumber sound;
But soon, as a ripple of shadow
Runs over the whisperous wheat,
The rumor ran over the meadow
With its numberless fluttering feet;
It was told by the water-cresses
To the brooklet that, in and out
Of his garrulous gracer recesses,
For gossip was gadding about;
And the brooklet, full of the matter
Spread it abroad with pride;
But he stopp'd to gossip and chatter,
And turn'd so often aside
That his news got there before him
Ere his journey down was done;
And young leaves in the vale laughed o'er him,
"We know it! The snow is gone!"
The snow is gone! but ye only
Know how good doth that good news sound,
Whose hearts, long buried and lonely,
Have been waiting, winter-bound,
For the voice of the awakening angel
To utter the welcome evangel,
"The snow is gone; re-arise,
And blossom as heretofore,
Hopes, imaginings, memories,
And joys of the days of yore!"

What are the tree-tops saying, swaying
This way altogether?
"The winter is past! the south wind at last
Is come and the sunny weather!"
The trees! there is no mistaking them,
For the trees they never mistake;
And you may tell, by the way of the stem,
What the way is the wind doth take.
So, if the tree-tops nod this way,
It is the south wind that is come;
And if to the other side nod they,
Go, clothe ye warm, or bide at home!
The flowers all know what the tree-tops say;
They are no more deaf than the trees are dumb.
And they do not wait to hear it twice said
If the news be good; but, discreet and gay,
The awakened buds dance from their downy bed,
With pursed-up mouth, and with peeping head
By many a grim dim winding way.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

PRACTICAL FISH CULTURE.

THE GRAYLING.

SINCE the publication of the trip to the Au Sable for this fish and their successful removal to my trout ponds, dozens of letters have been received concerning them, some of which were answered by mail, and the remainder given a postal promise to answer through FOREST AND STREAM, which will now be redeemed, together with such other notes regarding them as may occur. Those in the ponds have not yet spawned, (May 9th,) they are in a pond fifty feet long by ten wide, and from three to five feet deep, with a spawning race at the upper end; the pond is built of stone with a muddy bottom, except a deep hole in the middle, which is stone, and which fish usually keep clean from sediment as they huddle in it when alarmed.

The Ainsworth screens and race covers were put in 1st of May, but the fish have kept in the lower end of the pond until yesterday, when they took a position at the mouth of the race. The removal of these fish so near the spawning time has probably checked the development of the ova, and it has been a mooted question whether they would spawn or not, but the movement yesterday is encouraging.

The grayling does not appear to show as strong signs of ripeness as the trout does; its abdominal cavity is smaller in proportion and the belly is thicker and harder; this fish, whether equal to the trout for the table or not, most certainly does not deteriorate as much when gravid, its flesh remains firm. They have been rising at flies on the pond for some days but have only just begun feeding on what we can offer. They will take pieces of liver, if small enough, but cannot swallow as large a piece as a trout will; neither are they as wild as a trout, either in their native waters or in confinement; their eye is more prominent, which enables them to take food from the bottom readily; a proceeding that seems to be awkward and unhandy for a trout, as he has to elevate his tail in order to see it, but the grayling keeps an even keel and catches it on the run very gracefully.

The first examination of a grayling shows that it is an insect feeder; for its one little row of teeth, which are almost microscopic, could never hold a fish, and its thick stomach is especially adapted to grinding the cases of the caddis worm.

Mr. Green seems to think that this fish will prove a substitute for trout in streams where the latter will not live; he has not given any reasons for this, and if he argues so because the grayling is a spring spawner and hatches in less time and so escapes destruction in streams infested with dace where the trout egg lies seventy days and the embryo is helpless for forty more, I agree with him; but as to this fish being suited to water that trout won't live in, I beg leave to differ. Its limited distribution is one strong argument against it, and the clear cold water that it inhabits where it is found is another. I wish to add a little to the description given in my former article as a little longer acquaintance has developed new beauties; the eye of the grayling is large and full with a beautiful yellow iris, and when I wrote "the tail is forked and plain," I had not observed its pinkish edge, nor the changeable metallic green

lustre that it shows in some lights, which is more like that seen in silk. A glint of the same is also observable on the second dorsal. Many letters have asked the question: "Is this fish as handsome as the trout?" And in answer I will say yes, to some eyes, while to others it may not be. Seen from above it does not appear so, as the pink and white of the trout fins are more showy. The form of the grayling is more graceful than the trout's, and the head is beautiful, while the side of the trout and its lower fins are more gorgous than those of the grayling. The trout has not a handsome head to my eye; the lines are hard, and there is an expression of savageness in the jaws. The greatest obstacle in the artificial rearing of trout is their shyness the first year; many die because they will not leave the sides of the rearing box to take food, and there is a chance that as the adult grayling is tamer than the trout the young may have this quality also.

As to their hardness and adaptation to New York waters, I can say they are lively and apparently contented in their new home; some have died, mostly from fungus, though I can kill it now; many were too far gone before the right thing was found. This fungus appeared in the shape of finger marks where the scales were injured or perhaps loosened by too tight a grip, or by dryness of the hand; this fish will not bear as rough handling as the trout on account of its large scale, which comes off very easily. One author, Mr. Stone, says that fungus is caused by an insect which burrows into a wound and the woolly matter that grows from it is generated from its excreta, and that a bath of salt and water will kill it. I tried this and my fish kept dying; in despair I tried every thing handy that we could think of, among others, spirits of turpentine, magnetic ointment and saleratus—not with any clear idea as to their possible effect, but as passing straws that might effect a rescue from certain death. The last thing tried was a bowl full of salt and a tea-cup full of cream-of-tartar in half a tub of water. One dozen grayling have been kept in this all day by simply pouring the water with a pail once in an hour, while one trout that had the same complaint only lived a short time alone in it.

There are many fish in the pond now with a white scar where the fungus has been, which is now healed over. Out of 160 fish brought home, apparently all right, at least one hundred began to show fungus in from one to two weeks after arrival, and about fifty have died from it. Some specimens were sent to Prof. Baird for models for casts to be placed in the Smithsonian Institute, and we hope to get a live one there to paint from, as the colors fade so soon after death.

I have a hasty opinion from an eminent scientist that this fungus is of an entirely vegetable origin, and a promise from him of further investigation. Those that have been dissected by me show a soft bruised appearance in the fungous spots after the skin is removed, which looks red and sore. The grayling have been honored by many distinguished fish culturists' and anglers, among whom I may mention Seth Green and Hon. Stephen H. Ainsworth. Mr. Green watched them closely for several hours and then started for the Au Sable. Mr. Ainsworth was greatly pleased and several times remarked: "I had no idea that they were such a beautiful fish."

There is another point of difference between the trout and the grayling, which may as well be mentioned—that is, although the latter have been without food since the first of April they seem to be in good order, while the trout would have perceptibly fallen off in flesh. I also think that the grayling does not require as much oxygen as the trout and can therefore live with less flow, or can be transported in less water. There is a point to which I would ask the attention of scientific men. I have a collection of dorsal fins from the grayling which differ greatly in shape; some of them are shorter—that is, the last rays are shorter and the fin stands higher and is nearer square, while others have the few last rays very long, and the fin in life hangs over on one side of the back like the mane of a horse; the rays vary in number from eighteen to twenty-three. Can it be possible that there are two varieties in Michigan? and that the last mentioned is the noble standard bearer, *Thymallus signifer*? or, as the long fins are from larger fish, is it the case that the fin grows and assumes a different outline with age? I have sent several specimens of fins to different parties and intended to keep these; but if they will be of use to science they will be sent.

To save correspondence, I will say in conclusion, that those fish now in my ponds cannot be bought, and present engagements prevent another trip for at least five months; neither will any spawn be sold this season should I be fortunate enough to get any; also, that it is impossible to advise parties whether the fish will live and thrive in their waters or not. The only test of this is actual experiment, for I did not know that they would live an hour in my own ponds until it was tried.

FRED. MATHER.

For Forest and Stream.

FISH CULTURE IN ILLINOIS.

IN accordance with a call, united in by prominent gentlemen representing many of the counties of the State, a convention was held at Elgin, Illinois, May 5th, which eventuated in the organization of a long needed institution. The men who composed the gathering were earnest men, who had long viewed the subject of fish culture as one in which State aid, in the form of proper statutes, should be exercised in order to arrest the murderous means which have led to the extinction of the finest food fish on this continent. The following delegates were present:—Colonel K. K. Jones, Quincy, Illinois; Nahum E. Ballou, Sandwich, Illinois; Dr. W. A. Pratt, H. Gifford and D. S. Hammond, Elgin, Illinois; S. M. Church, C. J. Horsman, Rockford, Illinois; Charles H. Atkins and James M. Hyatt, Chicago, Illinois; D. G. Bean, M. J. B. Hawkins and D. H. Denny, Kan Ka Kee, Illinois; G. H. Steward, Plano, Illinois; Joseph Jackson, Millington, Illinois; S. W. Raymond, Ottawa, Illinois; Homer Wattles, McHenry, Illinois; William Le Barron, M. D., State Entomologist, Geneva, Illinois; and Lewis Elsworth, Naperville, Illinois.

A temporary organization being effected, and a constitution adopted, the "Illinois State Fish Culturists' Association" was born of the necessities and wants of the times, and must be regarded as the parent piscatorial institution of the State, taking its plan, as other institutions have done in other industries, as the guardian of Fish Culture in Illinois,

which all its friends hope may evoke something from our law-making power by which individual interests of fish culturists' may be protected, and means employed whereby our barren streams and waters generally may be restocked with such food fish as have become nearly extinct, and such foreign fish as may be found adapted to our waters.

The officers of the Association are:—Colonel K. K. Jones, President; W. A. Pratt, Vice President, and six others. Nahum E. Ballou, Secretary; and George H. Steward, Treasurer.

The constitution provides for semi-annual meetings, the first of which will be held at Peoria, Illinois, during the State Fair, on Thursday evening of the Fair week. The State Fair will be held in September, from the 14th to 19th inclusive.

It is hoped, and the officials of the Association have been somewhat encouraged therein, that inducements will be offered whereby fish culturists' may represent their different farms by aquaria containing trout in all stages of growth, which will be certainly an interesting feature of the State Fair and a source of encouragement to fish-breeders. Plans will probably be matured through which the Association can be made acquainted with the condition of the waters of the State by districting the State and appointing active committees over each district through whom we may learn what measures are necessary for restocking the rivers and streams. Nature in her munificence has bestowed upon us, as a State, resources for an immense industry in the cultivation of fish. It would only be within the limits of truth to say that within the borders of our commonwealth is an area of water equaling 500,000 acres. This, if thoroughly cultivated and made as fruitful as water may be through modern fish culture, would be equal in value to 2,000,000 acres of land. This is not an exaggeration. For the art of fish culture, as modernly practiced, has reached wonderful results in a pecuniary aspect. If a shad, (*Alosa praestabilis*), is capable of producing 60,000 ova, a salmon, (*Salmo salar*), 10,000, and a brook trout, (*Salmo fontinalis*), 3,000 ova, and the application of modern skill results in hatching ninety-five per cent. of them into vigorous small fry, and each of these becoming a new factor of increase, the augmentation is wonderful and the rapid evolution of values a natural and inevitable consequence. At Elgin, Kane county, Illinois, are two trout farms, one of which is four years old. Dr. W. A. Pratt has an area of forty acres enclosed, which contains springs equivalent to filling a pipe fourteen inches in diameter, which have been utilized in supplying some twenty-five ponds where he has now many thousands of healthy sprightly trout disporting themselves as gaily as their progenitors were wont to do in the forest streams. His first parent fish were obtained at Boscobel, Wis., and some ova from Seth Green at Rochester, N. Y. The Dr. finds trout-breeding as remunerative as those who have long been engaged in this industry, and finds it extremely difficult to keep a supply adequate to the demand for stocking new farms. Associated with fish culture the Dr. has a dairy of fifty cows and a nursery, all of which ought to make him happy. D. S. Hammond, near the city of Elgin, has a trout farm, with water facilities sufficient to extend the business of fish culture to the breeding of millions. He also is a dairyman, and these men have been sagacious enough to enlist and embark their capital in two of the best paying industries in Northern Illinois. N. E. BALLOU.

SHAD IN ALLEGHANY RIVER.

THE following letter of inquiry with its answers properly belongs to our Correspondent's column, but we deem it of such especial interest that we place it in the department of Fish Culture. We are indebted to Seth Green and A. S. Collins, of the State Hatch House, for our ability to answer the queries advisedly:—

OLEAN, N. Y., May 5, 1874.

EDITOR FOREST AND STREAM:—

Having taken considerable interest in the stocking of Alleghany river with shad and watching for the fruits of same, I am pleased to state that on 2d instant I saw the first shad at this point, which I discovered as follows:—Looking for my little boys, who had gone angling for suckers in the creek which empties into the Alleghany River here, I discovered that they had two small shad, one of which measured eight and a half inches in length and weighed four and a half ounces, the other about half as large. On exhibiting them I was told that the boys of the village had caught considerable numbers of them, calling them "silver shiners." Now for a few questions:—

1. What size should the shad planted at Salamanca two years ago by the Fish Commissioners be now?
2. Is it probable that those caught here are the ones planted; or are they the offspring of those?

3. When will we probably be able to take full grown shad from that planting, and what time of year? We are about twenty miles above Salamanca, the place of planting the young fry.

A reply to the above queries through the columns of the FOREST AND STREAM, together with such other information as you may give, will much oblige

Yours,

M. A. BLAKESLEE.

Answer.—1. Shad stay in the river the first two years, and do not go to sea. At one year old they are five inches long; and at two years from eight to ten inches. They are one and two years' old fish.

2. They are the fish that were planted by the Commissioners in 1872? Shad do not breed until they are three years old.

3. In three years; in May and June.

—The grayling spawn at Caledonia Hatch House are hatching out finely.

THE INTRODUCTION OF THE CALIFORNIA SALMON INTO AUSTRALIA.—Mr. H. R. Francis has just concluded, in the *Field*, a series of letters of undoubted merit, giving a most interesting account of Tasmanian pisciculture. The palm of antipodal fish culture must be awarded to New Zealand. While New South Wales was talking about it, New Zealand has successfully carried out all her plans. In regard to salmon, it struck us that our California fish, the *Salmo gairdneri* would succeed far better in Australian waters than the Scotch fish. To transport the ova from California to New South Wales would present no possible difficulty. Writing to Professor Baird, we find that this question has been already anticipated by the Fish Commissioner, as may be seen by the following interesting letter:

UNITED STATES COMMISSION, FISH AND FISHERIES, }
WASHINGTON, D. C., May 5, 1874. }

EDITOR FOREST AND STREAM:—

I have on various occasions, in articles written for *Harper's Weekly* and other journals, suggested the importation of the California salmon into Australia, in preference to the European variety, and I am under the impression that the same idea has occurred to our antipodal friends. If you will refer to a copy of my Annual Record of Science and Industry for 1873, you will find one of the notices referred to, re-produced on page 446. The saving of time and distance in the journey is a matter of prime importance, and I am inclined to believe that a Pacific Ocean salmon will be more likely to thrive permanently there than one that belongs to the waters of the Atlantic. Very truly yours,

SPENCER F. BAIRD, Commissioner.

The reference made by Professor Baird in "Annual Record of Science," is as follows: "Is it not a little remarkable that the gentlemen who have charge of the experiment of stocking the waters of Australia and New Zealand with salmon have not turned their attention to California, whose salmon are to be found much better fitted for the temperature of Australia than the European species. The Australian line of steamers from San Francisco could transport these eggs and deliver them in about thirty days, and with the almost absolute certainty of a successful result."

In reply to a question of the same character sent by us to Livingston Stone, Esq., that gentleman has sent us the following reply:

UNITED STATES FISH COMMISSION, }
CHARLESTOWN, N. H., May 11, 1874. }

EDITOR FOREST AND STREAM:—

Yours of May 4th is received. It has been my opinion for a long time that the California salmon were better adapted to the Australian waters than the British salmon, and I have no doubt that the California salmon will be sometime introduced there. The trip by steamer is only thirty days from San Francisco, which gives a margin of several months over the time required from Great Britain. Very truly yours,

LIVINGSTON STONE.

SHAD IN CALIFORNIA.—We publish by permission of Prof. Baird an extract of a letter just received by him from Mr. S. R. Thockmorton, one of the indefatigable and public spirited Fish Commissioners of California. It will be found exceedingly interesting, as it positively determines that shad are now found on the California coast, which is an additional triumph for the fish culturists:

SAN FRANCISCO, Cal., April 30, 1874.

Hon. SPENCER F. BAIRD, U. S. Commissioner of Fisheries:

DEAR SIR—The first shad taken on this coast, as verified by my own observation, was caught in a trap in Linson Bay, a branch of the harbor of San Francisco, about the 1st day of April, 1873. I purchased the fish and placed it in alcohol and presented it to the Academy of Sciences of the State of California. It is a male fish, 1 year, 9 months and 20 days old, is seventeen (17) inches in length and three pounds in weight. Two other shad were taken in the same locality during the summer of 1873, one male fish and smaller in size. On 28th of March, 1874, three others were taken in the same trap, the largest a male fish three pounds and a half (3½) in weight, and twenty inches in length, the other two much smaller, and also male fish (as I am informed), for these last I did not see. On that day (the 28th of March, 1874) our Legislature passed our bill forbidding the taking of shad for three (3) years from date, and consequently if any have been taken they have been so carefully concealed that we have no knowledge of them. I have been informed that during the winter last past two fish were taken in a small stream running into the ocean, some seventy miles north of this harbor, which were supposed to be had, but as I did not see them and have no acquaintance with those who are said to have seen them, I do not give it as a fact. Those shad I saw myself were very handsome shad, and my colleagues, Mr. Redding and Mr. Farwell, both of them as well acquainted as myself with the shad of the Chesapeake, the Hudson and Connecticut Rivers, considered them exceedingly fine specimens. S. R. T.

FISH CULTURE IN ENGLAND.

NORTH OF ENGLAND, May, 1874.

EDITOR FOREST AND STREAM:—

Being desirous to learn the mode of fish culture in the Mother Country inquired where it could be seen, and could only hear of one establishment of the sort in all England. This is in Borrodale, a rugged and romantic valley near Keswick, in Cumberland, which small town at the base of Skiddaw, is considered the centre of the lake district. I had letters of introduction to Mr. Gillbanks of Whitefield, alluded to in your paper of April 16, and this well known gentleman showed me every kindness. The weather was bitterly cold, so much so as to be painful. The "squire" or excellence insisted on driving me to the fishery, about 15 miles off, as he thought most of the fry would be coming out, which would be a very interesting sight. So yoking a magnificent chestnut horse to a light dog-cart, we arrived at Keswick, about ten miles, in a very short time. Another vehicle was procured here, and we set off without delay, skirting the banks of Keswick Lake, or Derwent water. We had not time to go to the top of Borrodale, but stopped at the Bowder Stone, one of its principal features. This enormous stone stands quite detached on the top of a grassy hillock. It is twenty yards long by about as much high, and is poised on a point like a top spinning; it is computed by engineers to be nearly 2,000 tons in weight. The whole scenery here is awfully grand, enormous rocks of the most unearthly and fantastic forms, hanging overhead as if ready to crush one every minute. The water is so clear from running over gravel that a pin might be seen at an immense depth. Though spring was far advanced—April 20—several of the mountains had snow on their summits, and Scawfell, the highest English mountain (3,160 feet), of which we had a good view, was entirely covered. We now turned back and walked up a sort of recess in the mountain side to the fish-house. Mr. Tarnaby, the proprietor, was absent and so was his assistant, both taking away large orders of fry to different parts of the kingdom. We saw an enormous quantity of fish in the breeding troughs; some a few days old, some with the umbilical sac still attached. There were abundance of young salmon, *salmo trutta*, and salmon trout; some great lake trout from Geneva, which get to be 4 or 5 pounds weight in a year or two; some of our *S. fontinalis*, and a great many of both sorts of English char. The color of the fins and under

parts of the "red-belly" species exceeded in intensity any vermilion a painter could find. One fine specimen in a tank seemed about three lbs. weight, and was perfectly tame. I believe Mr. Tarnaby brought some of these beautiful fish over to America a year or two since, and took back a good many black bass. He got several alive to Liverpool and some to the far end, where he thought he had got over all danger; to his great grief they died all at once. Chemists suppose from change of water. There is now a great change of weather. The heat is terrible in the day time, but cool at night. There is a wonderful show of fruit blossoms, which it is to be hoped will not be nipped by baneful frosts. There has been no crop of apples and pears in England for many seasons, and these fruits selling at same price as oysters, bringing three pence each. Though Mr. Tarnaby is a Yorkshire man, he learned fish hatching in Canada with his relative, Mr. Wilmot. I was glad to see our Mr. L. Stone's book on Trout, laying on a table at Whitefield. Mr. Gillbanks considers it the best book on the subject. With many thanks to the above gentlemen for what I saw and learned, Yours,

ANGLO-AMERICAN.

—Only 860,000 young salmon are to be put in the head waters of the Champlain this spring. Two million shad are going into the Connecticut at Bellows Falls.

—A meeting of the committee appointed to undertake the restocking of the Merrimack and Connecticut Rivers with fish, was held in Manchester, New Hampshire, on the 11th instant. There were present:—Hon. Frederick Smyth, the chairman, and Joseph Kidder, of Manchester; John M. Hill, of Concord; Dr. Edward Spalding, of Nashua; Gen. Natt. Head, of Hooksett; Hon. O. A. J. Vaughan, of Laconia; Martin A. Haynes, of Lake Village; and Dr. Fletcher, one of the Fish Commissioners. The following gentlemen were appointed a committee to draft a memorial to the legislature, giving their opinion of the feasibility of restocking the rivers with shad and salmon, the causes which have prevented success heretofore, and setting forth the instrumentalities now needed to accomplish the desired results:—John M. Hill, of Concord; Dr. Edward Spalding, of Nashua; Hon. A. H. Bellows, of Walpole; Judge Josiah Minot, of Concord. Adjourned to meet at Concord, on the second Wednesday in June, at the rooms of the Board of Trade. The gratifying earnest of future success which we observe, not only in the matter of rehabilitating our barren and depleted streams, but in protecting and propagating game of all kinds, is in the fact that leading men of all the States are now coming forward with their wealth and influence and personal efforts, and a unity of purpose not heretofore manifest, to secure their accomplishment.

For Forest and Stream.

WHITE FISH IN TWIN LAKES.—Four specimens of this fine fish were speared (oh law!) last night, May 10th, and one of them (a present, be it understood) lies before me as I write. It is fourteen inches long, well fed and as silvery white and grey as any *salmo* of them all, with the little adipose fin which proclaims its near relationship to that family, and not a bass as our Cooperstown friends will persist in calling it. "Otsego bass" forsooth! A large number were seen by the spearsman, but as he was only after suckers of from four to six pounds weight the white fish were looked upon as too small game for one who, "when he goes catting, goes catting." Now, with these beautiful fish, and the million or less of salmon trout that the proprietor of "Twin Lakes Trout Farm" is getting ready to put in the lakes, with, perhaps, a few grayling for the cold streams that run into it, won't the bright colors in which your correspondent "Piscator" paints our Waushineing continue to "Wash" as well as *shine*!

J. IVES PEASE.

NOTE.—The maw of the fish was stuffed "choke full" of the larvæ of the May fly, grubs from rushes, and mussels and a little gravel.

—The Massachusetts Anglers' Association, of Boston, have leased for five years new and commodious quarters in Baldwin's building, corner of Washington and Essex streets. At its meeting last week, twelve new members were elected and fourteen propositions received. Attention was called to the fact that the lobstermen are in the habit of throwing overboard, after their arrival at the wharves, all lobsters under 10½ inches in length, without removing the wooden plugs from their claws; and inasmuch as this forever prevents them from obtaining food the matter was referred to the Society for the prevention of cruelty to animals, as the most summary method of dealing with the offenders. This Association is a most vigorous one, and the efforts it is making to correct abuses, punish offenses, and increase the fish protection for food and sport, are worthy of all emulation by other similar bodies. It is to the care and intelligence with which societies like this investigate the natural habits of the fish and the influences deleterious to their increase, that authority must look for the knowledge requisite for successful action.

—Mr. N. W. Clark, the Michigan pisciculturist, states that, last November, he placed in the State hatching boxes 1,800,000 whitefish ova, of which all but about ten per cent. hatched. Since March 23d, he has distributed a million and a half of young whitefish in 194 lakes and rivers in Michigan.

—Sixteen fine salmon caught at Veazie, the lot weighing upwards of three hundred pounds, were sent to Boston from Bangor, last week. Two of the largest had in their fins a silver tag, placed there by the Bucksport Breeding Works when they were caught before.

—During the dry weather of the past week several exceedingly destructive fires have been raging in the woods of Suffolk county on both sides of the Long Island railroad. In the neighborhood of Deer Park 15,000 acres of timber were destroyed. Mr. August Belmont's great stable containing 76 valuable horses narrowly escaped. Serious destruction was also wrought by similar fires in Riverhead and in the Islip pine woods. The total loss during the week is rather loosely estimated at \$1,000,000.

Woodland, Lawn and Garden.

SMALL ROCKWORK IN THE GARDEN.

Your voiceless lips, O flowers, are living preachers,
Each cup a pulpit, every leaf a book,
Supplying to my fancy numerous teachers
From loneliest nook.

Posthumous glories! angel-like collection!
Upraised from seed or bulb interred in earth,
Ye are to me a type of resurrection
And second birth.

HORACE SMITH.

IN every suburban garden may be found some quiet nook, or some unappropriated location, sometimes a large boulder among the wild wood. These very often will be found of considerable extent, and though they are termed waste places they can be made very beautiful if skillfully handled by the landscape gardener, as they often admit of many additional features that under ordinary circumstances do not usually exist.

In a large garden, with an abundance of water, the creation of a beautiful and very striking grotto of rock work among the shade trees is very easy of execution, and may be made one of the chief attractions of the garden. Of the manner of constructing and arranging one of these grottoes I shall write in a future number of these papers, and in this confine myself to the arrangement and construction of a rockery adapted to a corner of the garden, or even a small centre-basin of rock work. Having erected in many small gardens, affording only a small supply of water, similar ornamental receptacles for the aquatic and half-aquatic plants, we think the information imparted, if followed carefully, will enable almost any one to make a picturesque and beautiful ornament to their garden. Therefore our lady readers will find in this paper a continuation of our last, with additional instructions for the arrangement of rock work and small water gardens.

We will suppose you have in your garden some fifty feet square of green sward, and perhaps in some one of the corners there grow some half dozen trees, evergreens, or half hardy trees. In this comparatively small space (it is all we have, and we will make the most of it) we will first strike a circle in the centre, as heretofore instructed, of eight feet in diameter. From this you will now remove all the earth, and lay it aside for future use. Make your excavation one foot and six inches deep, and carefully even the bottom, and if the bottom is loose pound it down well with a mallet, after placing two inches of clay over the same merely for the purpose of forming a pan. Now we suppose you have water—as is found in most cities—attached to your house. You will from a convenient place attach a half inch lead pipe to the house pipe, with stop cock attachment at a convenient place of access, and then bury the lead pipe say six to eight inches in depth, as you will use it only in the summer, and carry it into the centre of your excavation, turning the same upwards in a perpendicular manner as high as you design to have the top orifice. If you prefer you can have a flexible India rubber attachment, which you can affix and remove at pleasure with equal good effect. I have thus arranged small fountains in gardens which were truly a source much delight.

Having thus far followed our directions, you will now, according to your means and appliances, commence your reservoir for holding the water necessary to maintain your aquatic plants. Your largest diameter being eight feet, you will by means of small stones construct a circle of one foot width, between the walls running around the whole basin, and lay the same in hydraulic cement. This is for a circular flower pot, or receptacle to contain such plants as you desire, to give your rockery a prominence of greenness and aquatic life.

In your selection of stones and materials you will exercise your own taste. A fine effect is produced from the arrangement of quartz and jasper, feldspar and porphyry, and the amygdaloids found on the coast of Marblehead. You can also use mica stones, and, in short, consult your own resources, and you will scarcely fail in producing a fine and pleasing effect at a very trifling cost.

The height of this circular basin, or receptacle for flowers, should rise say six inches above the level of the lawn only, and be made quite level on the outside, though it is not necessary to have it perfectly even. This leaves you an inner circle of some six feet and a half in which to raise your rock work, which you will make in the following manner: You will choose such rocks of large size as will give an uneven circular form, and place them around the inner circle, uniting their edges with cement, and raising them to a height of three feet. At this height you will commence your bottom basin or aquarium by filling up the inside of your rockery with small rocks, and at the height of two and a half or three feet from the surface of the lawn lay evenly a coating of cement two inches thick as a bottom for your aquarium, as we propose to erect one in this rockery. Having carefully laid your cement bottom, you will now raise your aquarium sides—one foot and a half will be as high as is desirable—cementing it all around if a rock aquarium. If one or two sides are to be open, which can easily be made at this stage, you will procure two squares of glass, of the size and kind used in aquariums, and insert the same—one on each side, or three if you prefer them—within this rock basin, and you have a very fine aquarium and rock work united, the cost of which is very trifling compared with the care of constructing the same. You will keep in mind that in one case you construct a basin upon your rock work—a simple basin covered with pebbles from the brook, into which you can place gold and silver fish with good effect—or an aquarium made by the addition of three squares of glass, set equi-distant in this

basin, and through which you can look as you sit within your bay window or upon your rustic seat in the garden corner.

Now for your decorations. There are the plants that love the water, and I have already told you what they should be. You may add to them, if you please, for the tall piece of rock work almost any variety of hardy creepers, or half hardy creepers will do quite as well, such as lophospermums, Maurandia canariensis, and the different kinds of pessurnable. At the base on the outer circle you will perceive why I do not care to have the rim next the lawn even and smooth. This is the place for your sedums, saxifrage, etc. Wild sedums from the woods, mouse ear, and house leek make a fine variety for this outer circle, while the broad, awry leaf of the calladium esculentino and hardy wood pines give you an almost oriental splendor in your little aquaria in the garden. Do not forget to place in pots concealed with moss one or two fine thrifty plants of the cardinalis.

Leaving you to work out according to your own taste the above beautiful plan, which you can easily do, I will only suggest the attachment of the water jet to the end of your lead pipe to give you a complete fountain within your garden. This may be of any device you may choose to pay for, from a simple stream of water to a tulip jet or wheel, all of which may be regulated by individual good taste and a full purse.

OLLIPOD QUILL.

Natural History.

For Forest and Stream.

THE BLUE GROUSE.

THE blue grouse, pine grouse, dusky grouse, or Rocky Mountain grouse (*Tetrao obscurus*), is in many respects the finest of the grouse family. Its flesh is almost entirely white; as much so as the ruffed grouse (*Tetrao umbellus*), or the quail (*Ortyx Virginianus*), and has a peculiar tenderness and flavor.* The breast is remarkably full, and the whole body compact and plump. The feathering is close and thick, wings and tail short and square, the latter a beautiful fan when spread, like that of the ruffed grouse, which in fact it closely resembles except in size and color. Its food and habits are nearly the same, consisting of insects and the berries and seeds of the pine cone, the leaves of the pines, the buds of trees, etc. It has also the same habits of budding in the trees during deep snows as the ruffed grouse that are so often shot while thus engaged on winter moonlight nights in the orchards of New England. With the blue grouse, however, this habit of remaining and feeding in the trees is more decided and constant, and in winter they will fly from tree to tree and often be plenty in the pines when not a track can be found in the snow. If a trail ends it is time to begin to look in the trees, and look sharp, too, for it takes keen and practiced eyes to find them in the thick branches of the pines. They do not squat and lie closely on a limb like the quail, but stand up, perfectly still, and would readily be mistaken for a knot or a broken limb. If they move at all it is to take flight, and with a sudden whirr they are away, and must be looked for in another tree top. I have sometimes shot perhaps half a dozen times with a rifle at the same bird, aiming at the head to avoid tearing the flesh, but there would be no sign of motion unless hit. Where there are several upon the same tree, if the lowest is first shot the others are not disturbed, and may be picked off one by one; but if an upper one falls past them they are instantly off. This, too, is a peculiarity of the ruffed grouse. In autumn, when nearly or quite grown, and the pack are unbroken, if met with in open ground they lie well before a dog, and furnish excellent sport. When flushed, their flight is swift and straight, and they are easily shot, but if timber is near they are sure to make for it, and when in the trees a setting shot is the only sure one. Should they fly a single glimpse through the thick pine branches would probably give the only chance, and a hit would be nearly an accident.

I had a setter that, by long practice, acquired a wonderful sagacity in hunting them. He had learned their habit of staying in the trees, and when he detected the scent in the air its condition would soon satisfy him that they were in the trees instead of upon the ground. He would then begin to toss his nose upward, and circle rapidly till he had settled upon their whereabouts, and then come to a firm stand, with eyes and nose directed to the tree tops. Of course the precise locality of the game would be uncertain, but they were sure to be in the neighborhood, and he would sometimes rigidly maintain his point for ten or fifteen minutes while a search was made, and if it proved fruitless from the closeness of the pine branches, and he was called away, he left very unwillingly. In such cases I was sure he was right, and the bird would be often found on a research. Of course it was only where the pine groves were orchard like, with no undergrowth, that this style of hunting could be practiced. In common with the ruffed grouse, packs have a habit of scattering in winter, two or three, or even a single bird, being often found with no others in the vicinity, their habit of feeding in the trees tending to separate them. The size of the blue grouse is nearly twice that of the ruffed grouse, a full grown bird weighing from three

*What a pity we have not distinctive popular names of our native game birds. The ruffed grouse is called "partridge" in New England and New York, and "pheasant" in the Middle, Western and Southern States. Our choice little Bob White, who, in spite of all his enemies, will remain and increase as cultivation widens, for he loves the field better than the forest, is called "quail" in the northeast and "quail" and "partridge" indiscriminately in other portions of the country; and yet each are entirely different from the pheasant, partridge and quail of Europe. To be understood, we are obliged to describe each with an alias, and after all be incorrect, and sure to mislead a foreigner. Is it too late to remedy the confusion? The scientific names are too long and jaw cracking for common use. If we could find some old short Indian names with comfortable vowel sounds, it might be worth while to make an effort.

to four pounds. Its plumage is very beautiful; indeed, that of the male in winter and spring is perfectly magnificent. The feathers are very thick, and upon the neck, back, and wings a lustrous blue black, glistening like satin. Beneath the color is a dusky brown, but whitish under the throat, the legs fully clad, and the feathering extending into the toes. It seems fitly dressed to endure the rigor of its habitat, which is probably the Rocky Mountain country only, and in the pine forests from five to ten thousand feet above the level of the sea. The latter height is generally about the snow line in these regions, and at this latter elevation is found the ptarmigan (*Tetrao leucurus*), rarely seen because his home is rarely visited. Although the weather in the mountains is often mild and pleasant in winter, and especially healthy and agreeable from the dryness and purity of the atmosphere, yet the cold is sometimes intense, and here to prove and illustrate I will give a fact and an incident.

At Fort Laramie, which is at the base of the Rocky Mountains, and scarcely 5,000 feet above the ocean, in January, 1864, mercury froze for four nights in succession, and on the night of the 5th it remained frozen for fifteen hours. In the morning, while the mercury was still asleep in the thermometer, I was witness to an experiment tried on the surgeon's sanitary whiskey, which somewhat lowered its previous high reputation. A small quantity was set outside in a tin cup for about twenty minutes, when it was found sufficiently solid to fly into icy fragments when thrown against the walk. True, it had been wagoned across the plains, where the dry atmosphere, dry teamsters, and the waters of the Platte may have affected its quantity and quality, as is said sometimes to happen, but this is only conjecture. I merely give our analysis by temperature. But to return to our *Tetrao obscurus*. The nests are upon the ground, usually well hidden in a thicket, and the broods about one third larger than those of the sage hen, generally from twelve to fifteen in number. This is about the same as the ruffed grouse, to which I have so often likened it in this paper.

I have never met the blue grouse where pines did not abound, and have found them most numerous in the Black Hills from Laramie Peak to Long's Peak, in the North Park, on Medicine Bow Butte, a beautiful, isolated mountain a little north of the Union Pacific Railroad, with Fort Halleck at its foot, rising some two thousand feet above the railroad level, where eight or ten years ago elk, bear, and mountain lion (panthers) were abundant in the forest, and antelope and mountain sheep were numerous in the surrounding plains and rocky bluffs. I have also met them in the timbered foot hills on both sides of the Wind River Mountains, and no doubt they are to be found in the pine forests and groves of all the mountain region from the South Park north into the British possessions.

It would be interesting to test the acclimatization of this beautiful bird in the pine forests of the east. Though too wild and shy to be domesticated, it is not more so than the ruffed grouse, and if protected I see no reason why it should not live and thrive in any pine lands where the latter bird is found. Its present habitat is so vast, and much of it so inaccessible, that its numbers are not likely to be lessened by sportsmen, and its natural winged and four footed enemies will be as much or more exposed to destruction by man, so that we may look upon it as a permanency in its present home, and since the mountain passes are becoming threaded with railroads, and miners, herders, and other settlers are scattering through the country, it will be far easier than formerly to secure and transport live birds or their eggs. It is to be hoped the experiment will be tried.

VETERAN.

SORA IN MAY.

EDITOR FOREST AND STREAM:—

How many of our sporting friends are there who have seen a Rail, or Sora (*Rallus Carolinus*) in the month of May?

We were yesterday presented with the accompanying fine specimen by Captain H. Wild of Stockport, N. Y. You will observe it is in full winter plumage, but below a fair condition in body. It was found on Sunday morning, on the bridge crossing the mouth of Kinderhook Creek. It evidently in its migratory flight was following up the water course, and not being educated in regard to the whereabouts or the resisting power of a telegraphic wire, fell a victim to its ignorance. The habits of this very singular bird were for years a matter of profound speculation among sportsmen, as well as others, even so much so as to be often called by the name of the *mysterious*, whose out-goings and in-comings no one knew whereof. Travelling only in the night and rarely seen on the wing, even when hard pressed by a dog, until the high tides in the fall and the closely pushed boat drives them from their shelter in the reeds. They are so near the color of the dark mud or mire of the shores of the creeks, and they run in and out, threading their way through the reeds with such skill and swiftness that few are able to swear that the wee thing they just caught a glimpse of was a bird, a mouse or a young water rat.

Few, even among sportsmen that are habitually on the marshes, are aware of the presence of the thousands of these delicious birds, (save perhaps by their incessant cry of *creek! creek!* when startled by a sudden noise) until the seeds of the *zizania aquatica* upon which they feed commence ripening in the month of August, when all at once the flats are alive with them. Then again at the first hard frost they as miraculously disappear. Whether "they fold their tents (wings) like the Arabs and silently steal away," or as the darkies of Maryland, and even some lighter colored folks have asserted, they turn into frogs, from which they originally came, is a question which we think Captain Wild has emphatically settled. In fact we must confess we never really believed the darkie theory anyway.

HYDROPHOBIA—INEFFICIENCY OF MUZZLES.

WERE it not for the bane of hydrophobia, dogs would be generally welcomed in their legitimate place as the most faithful and intelligent of the lower animals as companions to man. Though the disease of rabies (incorrectly termed hydrophobia) is in reality so rare, it nevertheless has, or may have, an existence, and the fear of so terrible a malady excites an infinitude of apprehension antagonistic alike to searching inquiry and to the race which is liable to its generation. We wish in this brief article to call attention to several of the glaringly erroneous notions that from time without a beginning have attached to this disease.

First, is the belief that without any abnormal symptoms a dog may be attacked at any moment; that from that moment he will bite whatever comes within his reach, and that the virus necessarily inoculates the wound which is inflicted upon person or animal. The truth is, however, that the disease, like others, has its incipency, its aggravated progress, and that the proclivity to bite is a concomitant only of its culmination and last stages. Authentic cases are not wanting in which hydrophobic dogs have been handled until the last without ever attempting to bite the hand that cared for them.

Whenever the disease has been watched, a manifest sickness of never less than two, and generally from four to six weeks, has intervened before dangerous evidences revealed themselves. Dreuling at the mouth (not spuming), a strangely perverted appetite, the tracing of imaginary objects, and a never ceasing restlessness, are among the middle symptoms that never deceive.

It is commonly thought that rabid dogs shrink with horror from contact with, or even sight of, water. This is wholly erroneous, since from actual experiment, in eleven cases out of twelve, their thirst seemed positively unquenchable. Again, it is believed by many that the rabid dog, if unrestrained, will pursue a straight course, snapping at every object within his reach, until death terminates the march. It is the truth, however, that, except during the paroxysms of delirium, which seldom continue ten minutes at once, he seeks in his agony the most obscure, concealed places. The writer, in his own experience with hunting dogs, has witnessed the disease in its every stage, and, except during the periods of delirium, the dog has never evinced the slightest inclination to bite, and has recognized his master as usual.

Fits, with which young dogs reared in cities are often afflicted, are too frequently mistaken for rabies, and this has created not only a belief in the prevalence of the disease, but has lent a powerful influence in fixing the deep prejudice against all dogs which at present pretty generally exists. So marked, however, are the differences in the symptoms of the two affections, that it is remarkable that they should ever be confounded by the most timid and uninquiring. Epileptic fits seize a dog without giving a minute's warning, and are almost always caused by excessive heat or excitement. He runs about wildly, staggers, falls down, froths at the mouth from constant champing, his eyes are sometimes closed, or show only the sclerotic, or, if open, are dull and vacant. He regains his feet, toddles about mechanically, and, as if entirely deprived of sight, runs first into one thing and then into another. In rabies a dog never runs about without an object. Possessed of preternatural strength, he never staggers, never falls, except it may be to die. He dreuls at the mouth, but never froths (spumes). His eyes are frightfully and strangely bright and piercing, and are never wholly or partially closed. It gives, as has been stated, a long warning, and is more frequent in spring, fall, and winter than in summer.

As, therefore, fits never occur in any stage of rabies, their existence is a positive guarantee that the dog is not mad—indeed, they are a positive guarantee that the dog is perfectly harmless. Thus it will appear, if these facts were generally known, the one disease would never be mistaken for the other, and many valuable dogs' lives might be spared that are now sacrificed to cruelty, ignorance, and superstition.

It is unquestionably well that policemen should be instructed at all times to exterminate the useless mongrels that drag out a forlorn existence in the street gutters and dirt heaps. Deprived of food and drink for lengthened periods, alive with vermin, sickened with distemper, and suffering from every form and variety of disease that dogs are heir to, their destruction is, *per se*, an act of humanity, without any reference to hydrophobia whatever. Unless inoculated with infectious matter from the bites of rabid dogs, this malady, according to statistics, standard authors, and the experience of all intelligent dog fanciers, never attacks those which have a moiety of attention paid to their food, drink and general care. As if the virus of hydrophobia were the inspissation of filth, neglect, decay, suffering—the resultant scum that is finally incubated from this combination of horrors—it goads the dog on through tortuous stages to the exemption of death that refuses oblivion to agonies less intense.

The muzzling of dogs is wholly ineffectual to accomplish the ends sought, since only those are muzzled which never generate the disease. There is of late years, among men of northern cities, an earnest and increasing appreciation

of the invigorating and manly sport of woodcock and quail hunting, and, as a consequence, setters and pointers of the finest breeds are eagerly sought, well cared for, and highly prized. The nature of these splendid animals demands regular exercise, and the inconvenience and annoyance of muzzling one, two, or more every night and morning, as they are permitted to run around the block for this purpose, are greater than would be supposed by those who are not obliged to conform to so senseless a requisition. An ordinance directing policemen simply to dispose of the curs that prowl about the streets, evidently ownerless and uncared for, and rigidly enforced, would afford precisely the same security to the public, without entailing discomfort upon gentlemen who are necessitated to give their harmless and generally well-trained animals the daily exercise which their nervous, sensitive systems exact. In truth, there are few owners of hunting dogs who would not joyfully pay an annual tax if by such means the muzzling abomination could be forever abolished.

E. S. CARMAN.

—We paid a visit last week to the kennel of E. S. Carman, Esq., near Hackensack, N. J., the author of "Pointer and Setter," which, we believe, is the only work on the dog written by an American and published in our country. Mr. Carman's theory in crossing the pointer and setter, and then mating the setter with their progeny, or "dropper," is a bad one for several reasons. This system has been tried by almost every theoretical dog-breaker in England and signally failed. It is true that once in a hundred times the crossing of these two distinct animals has produced a fair sportsman's dog, but there is not one instance on record where this intermixing of the blood of the pointer and setter, and again breeding to their progeny, has ever developed a breeder's dog. As regards symmetry, action, style, and make, they are totally deficient, and would not take a third class prize on any show bench in the world. Supposing this twenty-five per cent. pointer and seventy-five per cent. setter did produce a fair all round dog, the consequences to the field sportsmen of America would be disastrous and ruinous, inasmuch as pot hunters and market gunners, who shoot at all and every season, would then amalgamate Jim's pointer with Bob's setter, and mate the progeny; whereas now the only safeguard we have got against this fearful miscegenation is the difficulty for Jim to find a first class pointer bitch to breed with his pointer dog, or vice versa. It is a known fact that if a pot hunter or a sly gunner can pick up a dog with a drop of pure blood in him, they make the most of it by coaxing, whipping, and everlasting companionship. Moreover, if this system of breeding is carried out over the country we would be worse than overrun with countless mongrels, that even now may be seen in any village street from Maine to California.

Mr. Carman's practice in training and breaking his dogs is evidently an excellent system. The process is one wholly induced by kindness—the sound of a pleasant voice, some determination, and constant watching, care, feeding, and friendship; and from what we saw of their performance we should judge they might do well over game. House-breaking and yard breaking is all very well in its way as a primary school to bring out the dormant instinct in a young dog, but if these dogs are not regularly shot over, and especially if their ancestors have not been marked performers in the field over game, they are very apt to forget all that has been taught them.

Mr. Carman is a gentleman who understands the handling, training, and working of dogs thoroughly, but we would respectfully suggest to him to give up this mysterious theory of breeding with the Anglo-Saxon and the Chinese in order to produce a superior animal in symmetry, brain, and courage, and procure a first class English pointer or setter and a good field American setter, and he would then have, in our opinion, the best strain of dogs in the world.

We are sorry we cannot agree with Mr. Carman in his system of breeding pointers and setters, but trust we can agree to disagree, and take this opportunity of thanking him for the kind manner in which he entertained us and showed us over his floral paradise.

FOOD FOR DOGS.

PHILADELPHIA, Penn., May 16, 1874.

EDITOR FOREST AND STREAM:—

Can you inform me if there is prepared in this country, or imported from abroad, any article of dog food which is wholesome and nourishing and put up expressly for use when on hunting excursions? There are two or three English preparations of the kind, called "dog biscuits," but after many inquiries among sportsmen and dealers in sportsmen's supplies in regard to them, I have been unable to obtain any information. A preparation of beef and oatmeal, or cornmeal, in a condensed form, made to keep in any climate and put up in packages of five, ten, fifteen and twenty-five pounds each, ready for transportation, is a great desideratum among many sportsmen. On several occasions, when on the prairies of Iowa, grouse shooting, in very sparsely settled portions of the State, I have been sorely annoyed at the unwillingness and inability of persons at whose houses I have been stopping to furnish sufficient food and the proper kind for my dogs. Any person who will introduce in this country such an article of dog food as referred to, will confer a great benefit to both the dog and his master. If you are unable to give me that information will you be so kind as to publish my inquiry in your paper in some form, in hopes that it will bring it from some one of your many readers?

BENJ. W. R.

[Spratt's dog biscuits. We believe they have no agents in America.—Ed.]

DOG SHOWS.

EDITOR FOREST AND STREAM:—

In Great Britain, for a number of years past, agricultural societies have been adding to their displays of finely bred horses, cattle, sheep, &c., a regular department for dogs in their fairs, and the exhibitions have proven so attractive as to be beyond doubt a great adjunct and source of revenue to the yearly meetings. The Pennsylvania State Agricultural

Society will give their fair next October, at Suffolk Park, Philadelphia, and should by all means open just such a department and inaugurate a grand Pennsylvania Dog Show. A great revival, as it were, has lately taken place on the subject of well-bred hunting dogs, and it will greatly benefit the cause to initiate a well conducted exhibition of this kind, and in Philadelphia alone enough fine animals can be found to make a splendid display.

The Agricultural Society should confer with the Philadelphia Sportsmen's Club, the protector of game, as well as insectivorous birds of the State, and I have no doubt would meet with hearty co-operation, for the latter association is active, energetic, and already has nearly three hundred members, and but two or three years in existence. The present game law framed by the society is of great benefit to the farmer, and it is but natural that the two associations should work in harmony in the matter of a dog show.

A committee of the Philadelphia Sportsmen's Club could advise the Agricultural Society as to arranging of the several classes of animals and the premiums therefor, and such an interest would be taken in the cause as to make the success beyond a doubt. An addition of this description to the fair in October at Suffolk Park, Philadelphia, would attract sportsmen from all parts of the United States.

"Homo."

The Horse and the Course.

—The Prospect Park Trotting Association held the first important race of the season on May 15th. The Association had offered a special purse of \$2,000 for a race of mile heats, best three in five, between the well-known trotting mare American Girl, in harness, the pacing horse Copperbottom, in harness, and the roan gelding Walter, with a running mate, to wagon. American Girl won the two first heats, but the pacer Copperbottom was two much for the mare, winning the race easily. A match for \$200, mile heats, best three in five in harness, between J. L. Anderson's Kiki in harness, and Barney Kelly to wagon. Kiki who was the favorite, won easily.

—The American Jockey Club have announced the weights for the two handicaps to be run at the June meeting on Jerome Park course. In the Fordham Stakes, a dash of one mile and a quarter Mr. Sanford's two horses, Preakness and Mate are awarded the top weight viz. 125 pounds and 123 pounds respectively. Tubman is weighted at 120 pounds, his stable companion at 114 pounds, and the four-year-old Survivor and Strachino at 112 pounds each; Boaster has 110 pounds; Artist and Business, 107 pounds; Tom Boston and Stanford, 106 pounds; Western Star and Fellowcraft, 105 pounds; Catesby, Minnie Mac, Mildew, and Gray Planet, each 104 pounds; Lizzie Lucas, War Reel, and Wizard, 102 pounds each; Milton, St. George, Sallie Watson, Long Branch, Periwinkle, Cariboo, and Oakland, 100 pounds each; Galway, ninety-eight pounds; King Philip, ninety-four pounds; Mary Constant, ninety-three pounds; Vaultress, Brigand, Egypt, and Valentine, ninety pounds each; the Etta Shipper filly, eighty-seven and a half pounds; and Mr. Cameron's two Warminster fillies eighty-two pounds each, being the lowest weight. In the Jockey Club Handicap, two miles, Mr. Sanford's Monarchist and Preakness having respectively 124 pounds, and 120 pounds. The lowest weight is eighty-two pounds, imposed on the Lady Sprang filly by Warminster. The acceptances by owners of these different weights will be published next week.

—The Kentucky Association closed their meeting at Lexington on May 16th. Everybody came to see Tom Bowling, the famous horse, run, but he only galloped and won easily. The first race was for the Consolation Purse, mile heats, for beaten horses, only two started, viz., Boyd's Nellie Grim and Grinstead's Lexington colt, which was won by Nellie Grim in 1:52½. The second race was for a purse of \$700 for all ages, a dash of three miles. There were four entries, H. P. McGrath's b. c. Tom Bowling, four years old, 104 pounds; T. J. Megibben's b. f. Passion, four years old; H. P. McGrath's blk. m. Lucy Jackson, aged, 111 pounds; R. Colston's Kate Vance. Tom Bowling won the race in the commonest of canters in 5:36½.

—The Maryland Jockey Club meeting begins at Baltimore on the Pimlico course Tuesday May 26th, continuing on the 27th, 28th and 29th with four races each day.

—The Mystic Park races closed on May 15th, the attendance was immense, and the races well contested. George Maynard won the purse of \$150, for horses that have never beaten 2:50; best three in five, in harness. Flora Belle won the purse of \$250, for horses that have never beaten 2:34.

—There are some queer little idiosyncrasies which coaching must develop in the drivers. Notable among coachmen was Sam Weller's glorious father, and some of our California drivers are full of strange, cranky notions. *Land and Water* tells us of a driver called Collier who fifty years ago drove the "Flying Machine." He seems to have been a naturalist of an experimental character. It was his ambition to run over a duck, and he informed a friend who often rode on the box seat "that he had all his life been trying to run over a duck, but had not been able to accomplish this feat of Jehuship. He had more than once (he said, when in vein, we suppose, managed to pin one, as it were, by the tail, but some how or other the creature invariably contrived to waddle off unhurt with the loss of a few feathers." We think it is somewhere in that cleverest of books, the "Autocrat of the Breakfast Table," where Oliver Wendell Holmes explains how difficult it is to run over a live dog. Now, we do not suppose for a moment that the most distinguished of our American humorists and authors ever tried absolutely by delicate maneuvering to run over a dog; but it might be interesting for Doctor Holmes to know that a duck exhibits precisely the same amount of miraculous wriggle and dodge and squirm at the approach of a wheel that a dog does.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfit, implements, routes, distances, seasons, expenses, remedies, trails, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

F. W. C., Patterson, N. J.—Will answer in our next issue.

E. R., New York.—Which Beaver Kill and Walkill stream do you mean, there are so many?

C. H. C., Brooklyn.—What kind of fish can be caught in Coney Island creek in the months of May and June, and what is the best bait? Bass; shrimp, crab and minnows.

E. G., New York.—What kind of fish is to be caught in Lake Champlain and Otter Creek, in Vermont? Ans. Whitefish, black bass, pike, lake trout, &c., in Lake Champlain, and trout in Otter Creek.

BLUEFISH.—You tell us to go to Barnegat for bluefish. What place shall we stop at? Ans. Watertown, N. J. Southern R. R. From thence it is only a short run across the bay to the inlet, where yachts and boarding can be found.

READER, Boston.—Can you inform me where to find a description of Mount Desert Island, Me., giving a full account of the objects of interest? Ans. Ask Osgood for "Costa's Mt. Desert," published some two years since.

BEAVER, Bald Mountain, N. Y.—Illustrated Handbook of Rifle Shooting, by A. Lord Russell, is published in Toronto, Canada. Could not tell you price. Suppose not more than \$1.50. Gerard, the Lion Killer we can send you. Price \$1.25.

E. H. B., Cornwall on Hudson.—Where can I procure a good American setter, and what would be the price if trained; also, what do you think of J. Lang & Sons' breech-loading shot guns? Ans. Write to Horace Smith, 266 South Fourth street, Philadelphia. The Lang gun is one of the best that is made.

W. S. W., Fort Wayne, Ind.—I am in need of a good setter pup and wish you to refer me to responsible parties that keep them for sale. I am not particular in regard to color, but would like to have as pure stock as possible, and oblige a subscriber? Ans. Write to Horace Smith, 266 South Fourth street, Philadelphia.

O. H. H., Redfield, Iowa.—Please state what size shot and whose make were used in the trial of the Remington shot gun, also if the numbers in the column headed average pattern, denote the number of pellets put in the target? Ans. Standard No. 7. The number of pellets were put into the 8-inch bullseye.

NEW SUBSCRIBER, N. Y.—Can you inform me if there are any trout streams which are public on the north or south side of Long Island, and in Westchester, also their location? Ans. Bronx is the only stream in Westchester, much fished, but a few trout left. Public streams on Long Island are the New Bridge, Cedar Swamp and Massapiqua Creeks. Take South Side R. R. to Oyster Bay. Good hotel kept by Powers.

W. W. S., New York.—I am in possession of a six year old thoroughbred trotting horse. He has always been driven with blinders. Would it be dangerous to drive him without them. Do you advise blinders? Ans. Tell your man to lead him three or four times without blinders and see how he acts. If it does not scare him to see everything that is going on, you might drive him on a quiet road first.

DOG CART, New York.—Can you please oblige me with your definition of the terms Tandem, String, Spike, and Four-in-hand teams? Ans. Tandem—one horse in the shafts and one leader in the traces, at length. String—one horse in the shafts and two or more leaders ahead of each other in traces. Spike—two in the shafts and one ahead. Four-in-hand—two in the shafts and two leaders ahead in traces.

R. W. A., New Haven.—I have a setter pup six months old that I would like broken. Can you inform me through your paper who to send to? I would like some one as near New Haven as can be found. Am willing to pay to have him thoroughly broken. I have also a setter dog that is two years old, rather headstrong, wants to range off quite a distance, has a splendid nose. Can I do anything to keep him? Ans. Write to O. H. Lombard, North Woodstock, Mass.

V. L. B., St. Louis.—There are no hotel accommodations nearer the Twin Lakes than Salisbury, six miles west, or Canaan, four miles east, though there are private houses near the shores that take in transient visitors for love or money—mostly money. Trains on the Conn. Western Railroad pass and re-pass many times a day, stopping at the station on flag, and at Chapinville regularly. From the Grand Central to this station through tickets can be bought via Harlem, \$2.80, four hours, or Housatonic, at \$3, an hour or two longer time.

J. M. W., Philadelphia.—Will you inform me how to fasten the minnow on the hook when fishing for perch? Ans. Put your hook through its mouth and out of the gills and fasten into the top part of the back, or simply pass the hook into the shoulders. A minnow will live in this way for a considerable time and swim naturally. Q. Also, how to use roe for bait so that it will resist the action of the water? Ans. Place a portion as big as a marble into a little bag of mosquito netting and tie it to the hook.

MOUNT PLEASANT, Sing Sing.—What is the expense of a two months' trip to Colorado from Chicago, and what are the average expenses per diem? Ans. Six dollars per day. 2. Can cartridges for a breech-loading shot gun be procured in the large cities of Colorado without sending east for them? Ans. Yes. 3. Will not a trip to the Yellowstone Valley be rendered dangerous this summer by the hostilities of the Indians? Ans. Must take the chances. 4. Would hunting within twenty miles of Denver be attended with danger from Indians? Ans. No. 5. What is the railroad fare from Chicago to Denver, and what route is most convenient? Ans. Union Pacific Railroad. 6. What outfit is necessary for two months' hunting in Colorado? Ans. They will fit you out at Denver; go light.

—A Yale student has written a twelve verse poem, entitled, "We kissed each other by the sea." "Well, what of it?" asks a Western journalist; "the seaside is no better for such practice than any other locality. In fact, we have put in some very sweet work of that kind on a tow path of a canal in our time, but did not say anything about it in print."

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, MAY 21, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, May 22d—Beacon Park, Boston, Mass.—Boston vs. Athletic at Brooklyn.

SATURDAY, May 23d—Practice day Harlem boat clubs, Harlem—Opening day Prospect Park Cricket Club—Columbia College athletic meeting St. George's Grounds, Hoboken—Boston vs. Atlantic B. B. C. at Boston, Mass.

TUESDAY, May 26th—Maryland Jockey Club, Pimlico Course, Baltimore, Md.—Lawrence Riding Park Association, Lawrence, Mass.

WEDNESDAY, May 27th—Maryland Jockey Club, Baltimore, Md.—Suffolk Park Association, Philadelphia, Penn.—Scranton Driving Park Association, Scranton, Penn.—Lawrence Riding Park Association, Lawrence, Mass.—Match day St. George's Cricket Club at Hoboken.

THURSDAY, May 28th—Maryland Jockey Club, Baltimore, Md.—Scranton Driving Park Association, Scranton, Penn.—Suffolk Park Association, Philadelphia, Penn.—Southern District Agricultural Society, California—Annual Regatta at Savannah, Ga.

THE SPORTSMAN'S CONVENTION.

WE are very glad to see the liberality conveyed in the very general invitation extended in the following letter. It is judicious and important just at this time to gather as much light as possible on the momentous questions which sportsmen and conservators of game are discussing. "Out of a multitude of counsellors there is wisdom."

NEW YORK STATE ASSOCIATION,
FOR THE PRESERVATION OF FISH AND GAME.
OSWEGO, N. Y., May 18, 1874.

EDITOR FOREST AND STREAM:—

GENTLEMEN:—As the time for holding the Annual Convention of the "New York State Association for the Preservation of Fish and Game" draws near, will you permit me through the columns of your paper to extend an invitation to all Field and Stream Shooting Clubs in this State to send five delegates, also two county delegates to represent their respective clubs in the convention at Oswego this year. This invitation is particularly extended to clubs in the eastern part of the State who have never (or not recently) participated in our annual meetings. It is hoped and expected that every club in the State will be represented at the annual business meeting, to be held on the evening of the first day of the convention, when the election of officers for the ensuing year will take place; also, the place for holding the next annual convention will be fixed. The local club (the Leather Stocking) under whose auspices the convention will be held this year, hope to be able to fix the time of meeting early in June. Ample hotel accommodation (at special rates) have been secured for all delegates and members of clubs, both active and honorary.

I am sincerely yours,
A. C. MATTOON, Pres't, State Association.

DAKOTAH AND SOUDAN.

IN a singularly interesting communication by our well-known contributor, Prof. Cope, which we find in the *Penn Monthly*, on "The Succession of Life in North America," in treating of the various stages of vegetable life in that portion of our country now known as Kansas and Dakotah, the author makes the following statement:—"The land was covered with a rich and dense forest vegetation, and the bog-moss encroached on the lake. . . . But the moss performed its old function of coal maker. Humblest among plants, its existence has been more important in world-building than that of all the lords of the forest. Its mosses died and new layers of living plants grew upon them, until the descent of the new land and encroachment of waters deposited the stone lid upon their treasury of carbon, not to be unsealed until the long future day of human empire."

From primeval Dakotah to the present Soudan, both chronologically and geographically, the period and the distance is immense. The following abstract made, however, from a letter of Ismail Pacha Ayozer, Governor-General of Soudan, under date of Mareh 18th, addressed to the Secretary of our American Geographical Society, will be found, strange to say, most pertinent to this very question of immense vegetable growth in rivers and swamps. The Egyptian officer writes:—"I dare say you will be acquainted with the fact that one of the principal obstructions which explorers and merchants bound for Central Africa, who chose to go by the way of the White Nile, had to encounter was the 'Sudd,' a great mass of vegetation which in the course of ten years so obstructed the navigation of the White Nile entirely, that only in the rainy season small vessels could reach Gondokoro. . . . It has been my constant aim to have this obstruction cleared." Under instructions from the Khedive, the Pacha undertook the work. He tells of how an enormous portion of the "Sudd" gave way and surprised the party in the middle of the night, and how five ships were lost and a steamer was upset. As a curious accident of this break in this vegetable mass an hippopotamus was crushed to death against the sides of the steamer.

Nature thus repeats herself. What happened in North America at a distance of time, which, chronologically, we can hardly determine, is now occurring in Africa. A curious speculation enters here, of the newer element, that of man, which, to a certain extent, more or less appreciable, may singularly modify the course of terrestrial events. As it is, changes now going on under our very eyes, may singularly aid us in studying the actions of those forces which were spent thousands and thousands of years ago.

NEWFOUNDLAND—ITS BEASTS, BIRDS AND FISHES.

WE are indebted to Alexander Murray, Esq., F. G. S., well known for his geographical surveys of Newfoundland, for numerous documents, which have been of material service in acquainting us not only with the geography of this most interesting country, but with its Flora and Fauna. During the numerous surveys undertaken, not only coastwise but in the interior, Mr. Murray seems to have devoted a great deal of attention to the animals and birds of this region. In a lecture, delivered at St. John's last year by this gentleman, we have certain *aperçus* of the zoology of Newfoundland, which we avail ourselves of. Mr. Murray remarks that what struck him most particularly, in regard to the birds and animals of Newfoundland, was the remarkable lack of variety. On the neighboring continent, separated from the island by but a narrow strait, the moose, the deer, the lynx, porcupine, glutton, wolverine, mink, fisher, and American hare, with some three kinds of squirrel, and the marmot, all abound, while in Newfoundland, the animals are limited to the caribou, the black bear, the beaver, musk-rat, martin, wolf, fox, weasel, otter, a large species of mouse, and the Arctic hare. As to birds, while in the Canadas there is an endless variety of migratory ducks, teal and widgeons—there are only two species, the black duck and the green-winged teal on the island. Wild swans and geese are absent. The ruffed grouse is unknown, the spotted grouse are rare, but the ptarmigan, of which there are two species, flourish gloriously. The American eagle, the osprey, two varieties of kite are found; and of owls, there is the great white Arctic owl, one species of horned owl, and one small variety. The raven, carrion crow, are here too; but of woodpeckers, while in Canada there are eight or nine species, but two small species have been observed in Newfoundland. Occasional specimens of the blue jay and kingfisher have been noticed, but of the larger butcher-bird, these are found in quantity. The passenger pigeon, or the woodcock, Mr. Murray says, have never been known to exist on the island, but the common snipe, the same as abounds on the continent, lives on the island unchanged in appearance. Of four species of thrushes the red-breasted, the long-tailed, the brown, and the cat-bird bound on the continent; but one, the red-breast, migrates to Newfoundland.

This paucity of species in the denizens of the air is carried out as regards the dwellers in the water. The large lake trout, the white fish, the maskanonge, the black bass, all found swarming in the rivers and lakes of the mainland, are absent in Newfoundland as far as the inland waters go. Mr. Murray states that the catalogue of fish only includes two species of trout, eels, minnows and sticklebacks, which is not encouraging for the sportsmen; however, salmon and sea-trout are found in abundance in the estuaries.

Regarding the facilities for the migration of animals,

though the Straits of Belle Isle are but twelve or thirteen miles across, this narrow passage is so frequently blocked up with ice, that it must not be difficult for animals to cross. The only deer indigenous to Newfoundland, is the caribou. Mr. Murray states that though larger than the reindeer of Lapland, they are even bigger than those of the neighboring continent. Our authority informs us that they cannot be tamed, and that the caribou dies under restraint. One very interesting portion of Mr. Murray's discourse, in regard to the killing of the caribou, we give in full:—

"Many very absurd stories are told about the wanton and wasteful destruction of those noble animals by sportsmen, who occasionally come here, from different parts of the world, at great personal trouble and expense, for amusement and adventure. A knowledge of the habits of the deer will immediately refute this accusation. Destruction and waste there most assuredly are, but it is not on the part of sportsmen. It is rather on the part of those in particular who originate the stories to which I refer, as I shall presently show. The habits of the animal are gregarious between the beginning of November and the month of May, and during the early months of the year they sometimes herd in hundreds, if not thousands, together. But between the 1st of June till nearly the end of September they are nearly or altogether solitary; the stags especially, and the does rarely, have any company besides their fawns. They are also migratory; and in their migrations they travel to the north-ward (speaking generally) in the spring, or during the months of March and April, and south-wards in the fall, between the middle of October and the end of November. Now the only time that sportsmen engage in their warfare against the deer is from the beginning of August till the early part or middle of October, during the time that the animals are more or less solitary, and consequently when they could not, even if they would, possibly kill more than one or two in a single day. On the other hand, those that are not sportsmen but pot-hunters choose their time, when the poor creatures are migrating in great herds in October, November and March, intercepting them in certain well-known lakes, and butchering them by every conceivable means and weapons—sometimes in hundreds in a single day. There may be some excuse for this wholesale slaughter in the fall, when the animals are in prime condition, or in the earlier days of the year, when the herds approach the coast mountains; but there is surely none for the destruction in the spring, when the flesh is literally worthless, the skins good for nothing, and every doe on the point of giving birth to a fawn."

× The subject of the Phocidæ or seals is one which we always approach with some hesitation. We entirely concur then with Mr. Murray, when he states "that it is astonishing how little is known of the habits of many of these creatures, on which the prosperity of the country so greatly depends." All we know about them is, that they produce their young on the ice in March. Of the four species, the harp, the hood, the bay seal, and the square flipper, all are found, and they contribute largely to the wealth of Newfoundland; one, the bay seal, perhaps never leaves the coast; but as to the others, as far as their migrations go, it is as yet all a mystery.

We have drawn most liberally from the instructive lessons Mr. Murray has given us, and we trust in subsequent articles to treat of the geography of the country and the various explorations made into the interior. We have now in type an article on the great auk of Newfoundland, today an extinct bird. It has been prepared for us by the same writer whose account of the Octopus appeared in our columns some time ago. We trust in time, through the columns of the FOREST AND STREAM, to make Newfoundland something else than a *terra incognita* to our readers, and by the help of our numerous friends in St. John's to shed thereon a full flood of light.

CREEDMOOR.

THE OPENING MATCH—THE AMATEUR RIFLE CLUB.

SHOOTING FOR THE AMATEUR BADGE.

SATURDAY, May 6th, was not an auspicious day. Rifle men looked at the meteorological reports in the papers and read that the prediction was rain. The day was foggy, rainy, and threatening. Undampened, however, was the ardor of the members of the Amateur Rifle Club, for rain or shine the match was to be shot. Now it must be born in mind by those of our readers ignorant of the peculiarities of rifle shooting that experience to be gained on rainy days, as to effect of light, appearance of target, on such stormy occasions are not to be overlooked. Matches and important ones are to be contested not only on those days when the sun shines bright and the air is clear, but when old Sol. is hidden behind clouds, and when the rain falls in torrents. In fact the dull grey light of wet weather gives the targets a uniform appearance, and permits of superior shooting.

We need not mention that the opening day of the season of Creedmoor, the first event of 1874, has been looked for with a great deal of interest. With the match of the Irish team on our hands it was felt by the amateur Rifle Club, the elite of the N. R. A., that no time was to be lost, and that the sooner practice commenced the better would be our chances. So, disregarding the inclemency of the weather, and the possibilities of having to lie flat on their stomachs on the wet grass, providing no India-rubber blankets could be had, some fifteen of the members were punctually at their post on the range at Creedmoor.

It was noticeable that many of the experts had their rifles new stocked with the pistol grip, and that the new Remington or Sharp sight were on most of the arms. A few of the members had been on the ground some short time before the match opened, and had thus been able to get their hands in as well as to ascertain the necessary elevation. The remainder, however, did not arrive upon the range until shortly before the prescribed time, and consequently, although using sights which they had never

tested, were obliged to enter into the match without previous practice except the traditions of last November.

A curious error was made by the markers, which might have caused some delay. The rain having washed off the lines designating the centre, the markers delayed repairing them until the time of the match, and then, in their haste and being a little "rusty," managed to reduce the size of the centres some six inches on all the targets. After some short deliberation, as time was short, and "what was fair for one was fair for all," it was decided to commence firing without making any change. This, of course, may account for some of the scores not counting actually as high as they were worth.

The shooting was admirable in every way, as may be seen by the scores. During the match the sky was overcast, but there was little if any wind, and the day was an excellent one in every way for shooting, there being no glare, glitter or atmospheric disturbances.

The conditions of the match were as follows: Distance, 500 yards; position, any; rifle, any breech-loader, not over ten pounds in weight and having a minimum trigger pull of three pounds; open to members of the Amateur Rifle Club only:

FIRST MATCH FOR THE BADGE GIVEN BY THE A. R. CLUB.				
Name.	Rifle.	Score.	Total

L. C. Bruce.....	Ballard sporting.....	0 2 0 2 3 0	9	
			306	

Average—2.914.

Mr. Conlin's score of 28, all he could possibly make, hitting the bullseye seven times hand running, was admirable shooting. Of course, Mr. Conlin had the badge given to him, and he had the honor of wearing it for a while. As the condition of holding the badge permanently required that it should be won three times by the same person, a second match was in order, when the following equally handsome score was made:

SECOND MATCH.				
Name.	Rifle.	Score.	Total	
John Bodine.....	Remington sporting..	4 4 4 4 4 4	28	
G. W. Yale.....	Sharp sporting.....	4 4 3 4 4 4	26	
H. Fulton.....	Sharp military.....	4 4 3 4 3 4	25

P. G. Sanford.....	Remington sporting..	2 0 0 0 4 2	12	
			304	

Average—2.895.

Wind light from the west during the match, requiring the moving of the wind gauge about one division. Later in the day hardly any perceptible wind.

Again we find the same excellent score made by Captain Bodine as by Mr. J. S. Conlin in the first match, 28 being scored, every shot making a bullseye. Taking both matches together, the 210 shots made a total of 610, being an average of 2.9-10, or a fraction less than a centre for every shot. It must be always born in mind that this average compared with previous scores should have been appreciably higher, as the lines of the centres were made six inches smaller in the target than they should have been. To Captain Bodine was then given the badge, which he had so cleverly won. We need not state that the victor combines within himself all the requisites of a perfect rifleman; cool, quiet, and imperturbable, he is as excellent in theory as in practice. We trust as the season continues Captain Bodine will make the same effectual shooting at long ranges, so as to become an integral part of the American team, who are to fight the coming battle with the Irish eight. Both, Mr. Conlin and Captain Bodine, occupy already prominent places in our rifle annals.

The match is remarkable in this respect: Of the fifteen rifles used seven were Remingtons and seven Sharps, with one Ballard. In the first match the first four rifles leading the score were as follows: One Sharp and three Remingtons. In the second match it was two Remingtons and two Sharps. Who can doubt of the excellence of both arms? Mr. J. P. M. Richards, one of our leading marksmen, was suffering from a boil on the neck, which may account for his score not being as high as his usual average. Mr. Lloyd made, on the second match, 24, with a Sharp military rifle, which is worthy of notice.

For comparisons sake with English shooting, we give the scores of the best five in the match between Lords and Commons, distances being the same and diameter of bore of arms about similar, the match having taken place last year: Best five Lords, 111; Commons, 123; Best five Amateurs, 1st match, 128; Amateurs, second match, 127.

RECAPITULATION OF MATCHES OF THE AMATEUR RIFLE CLUB FOR THE BADGE.				
Date.	Winner.	Rifle.	Score.	Total.
July 12, 1873.....	Bodine.....	Metford.....	4 5 4 3 4 4	25
Aug. 9, 1873.....	Bodine.....	Remington target....	4 4 3 4 4 4	27
Sep. 13, 1873.....	Rich'ds.....	Sharp sporting.....	5 4 3 4 4 4	26
Nov. 1, 1873.....	Omand.....	Remington sporting..	3 3 4 4 4 3	25
Nov. 8, 1873.....	Rich'ds.....	Sharp sporting.....	4 3 4 4 4 4	27
May 16, 1874.....	Conlin.....	Sharp sporting.....	4 4 4 4 4 4	28
May 16, 1874.....	Bodine.....	Remington sporting..	4 4 4 4 4 4	28

Mr. Bodine's score in the various matches was 80, out of a possible 84, making his average 3-80 for each shot.

Satisfactory as this opening match has been, we must by no means be over elated. A good deal of steady and serious work must be undertaken before we can cope with the Irish team at the longer ranges.

On Saturday, May 30, the Amateur Rifle Club will shoot at the 800, 900 and 1,000 yards match for the badge now being prepared by the Club, due notice of which will be found in our columns.

THE EFFORT TO INTRODUCE PINNATED GROUSE INTO ENGLAND.

WE have to acknowledge the receipt of a most interesting letter from Jackson Gillbanks, Esq., of Carlisle, England. It is most gratifying for us to notice that gentlemen on both sides of the water, Mr. Valentine, of Wisconsin, and Mr. Gillbanks in England, are directing their attention to the introduction of our game birds into England. In our last issue we stated that Mr. Valentine has requested us to name certain gentlemen in England to whom the eggs of the pinnated grouse should be sent, and we expect very shortly to make a shipment of these eggs to England. We trust at some later period to inform our readers of the result of the experiment. We would warn our English friends against irresponsible persons who may promise to send over the eggs of the pinnated grouse by the bushel. It is true that a number of eggs might be gathered, but all the chances would be against their being in good condition, so as to insure their hatching. There would be no difficulty in transporting the eggs from the West to New York, or by steamers to Liverpool; the trouble, we repeat, would be to get the eggs fresh, just as they had been laid. We believe Mr. Valentine will be able to procure them. The live birds could be obtained in quantity, but it is questionable whether they would do as well as birds hatched out from the eggs in England. Mr. Gillbanks writes: "I know the birds could be got best, easiest, and therefore cheapest in the fall of the year. The objection to sending them before the end of March is this, and it is a very serious one: in the fall in England the country is the barest, labor is so scarce and dear that the smallest farmers have to cut their crops with machines, which leaves the fields quite as bare as the back of your hand. Again, the game season is not out (second of February is our last day), and the birds would be in most danger. If we had eggs or birds about now (May first) all is quiet, the corn springing, and the meadows and sown fields getting a good length, so the birds would have food and shelter directly."

We believe that prairie chickens could be sent in March to England, or that if kept here longer alive they might be sent to England so as to reach there about the beginning of February; in fact Mr. Reiche has assured us that he would undertake to deliver live birds in England at that time.

We again beg to state that we shall only be too glad to do all in our power to further the introduction of the pinnated grouse into England. It is an experiment certainly worth trying.

CORINTHIAN YACHTING.

AMONG our yachting paragraphs this week will be found mention of another proposed Corinthian race. In this case the cup, given by the flag officers of the Seawanhaka Yacht Club, will be the prize for the successful sloop, manned entirely by amateurs, in the regatta which has been fixed for the third of July. The FOREST AND STREAM is heartily in sympathy with all these movements toward the introduction of Corinthian sailing and the consequent development of nautical knowledge theoretically and practically among our yachtmen. A man is not necessarily a sailor because he owns a yacht, but the man however, who takes entire charge of his vessel, steers her himself, and who exercises his own judgment as to the proper trimming of the sail he allows her, and who comes in victorious through a well contested regatta, is very apt to be a yachtman or sailor. We regard the terms as synonymous. If yacht owners desire to be yachtmen let them sail their boats. Owning boats will not make sailors. Sailing boats will. And let them enter every possible race, for the experience and practice acquired in racing is infinitely more valuable than that gained under ordinary circumstances. We trust, too, that other clubs, induced by the example of the Seawanhaka, will enlist in the same cause, and that very soon Corinthian racing and sailing will be among the most important features of our yachting seasons.

THE EXODUS FROM FLORIDA.—Although the hotels along the St. John's river were deserted early in April, and even St. Augustine with its cool sea breezes was desolate, Florida throughout the month was as charming and pleasant as ever. A few warm days early in March had deluded the visitors into the belief that "balmy spring" had come. But it hadn't, as doubtless many invalids found to their cost. The influx of visitors to the St. John's this winter has been beyond precedent. Every hotel and boarding house has been crowded to overflowing. A few boarders still lingered at New Smyrna as late as the middle of April. The Brock House at Enterprise was just closing, and at Palatka, St. Augustine, and Jacksonville the hotels were closing, and the few that were open were reducing their expenses to suit the season.

—This week Mr. Charles Reiche will let loose in Central Park some 40 pairs of skylarks, 12 pairs of chaffinches and a number of English robins. These birds Mr. Reiche has had brought over from Europe for this special purpose. Let us trust that Mr. Reiche's gift will be fully appreciated and that the birds will thrive and prosper and repay the donor and all of us by their pleasant songs.

Sporting News from Abroad.

[May day in England! That means fields and hedges all green with sweet bravery, and trees milk-white with perfumed blossoms, and that nature as a bride, with dewy eyes stands waiting all shy and coy, bedecked with blushing flowers. It is pleasant to hear, even to read, of such things. Most of us children of that grand stock, love to dwell upon the reminiscences of the opening spring day of the English year. Sentimentality in FOREST AND STREAM, and why not? Because men love dogs, horses, and birds and fish, and write of trials of human endurance, and of flesh and muscles and thaws, and of cricket, and boating, shall they not indulge in some little day dreaming, and think of sprays of hawthorne, and daisies and violets? It has been a rough May with us on this side of the Atlantic so far, raw and cold, but of late the sun has shone, and we too are now glorying in the "quickening time of the year." Perhaps we feel just a trifle kindly at this present moment, for as far as "Sporting News from Abroad" goes, our reviews of such matters, will now be written for us in England, by a younger and abler hand. The *rechauffé* of such foreign subjects as we have thought would interest our readers, we have so prepared in this office for the last nine months. But what is a warmed up dish? The fresher feast will undoubtedly be more palatable with this preface. We take great pleasure in introducing to our readers, our special correspondent.—Ed]

BY OUR SPECIAL ENGLISH CORRESPONDENT.

THE past week has been rife with important events in the sporting world—the City and Suburban handicap, and Shrewsbury and Devonshire, and Cornwall Field trials. The latter are more in my line than the former, for though I like as well as any other Briton to back my fancy, and see the glorious sports, and scientific horsemanship of Fordham, or the energy and grace of Osborne in the saddle, yet I own I love better the instinct of my setters, and the breezy moors or leafy woodlands. But there is one anecdote which circulated in the London clubs, apropos to the above race, which is worth relating, as it is I believe authentic. The night before the horses ran, a certain nobleman well-known on the turf, to wit, Lord Z—d, dreamt that a horse called "Teacher" was sure to be a "good thing," and thereupon taking a fancy to his nocturnal prophecy he went to the course to back him. He found, however, that nothing came to the post of that name, but quite by accident he heard that there was a rank outsider entered who might run, who had originally been called "Teacher" in his two-year-old days. This was Lord Roseberry's "Aldrich," and Lord Z—d accordingly laid out a good round sum on him at 40 to 1, and one of his lordship's friends did likewise. The results of the race you of course know. The sad accident which "extinguished" Mr. Merry's Bullseye proved a great blessing to the *soi-disant* "Teacher," for he won with the greatest ease, and never was there a more singular prophecy, or a more singular fulfilment of it.

"Eccossais" is still everybody's favorite for the Derby, but he will have a trying ordeal in the Two Thousand Guineas, though it has of late years proved but a poor criterion for the blue ribbon of the turf.

—The National Field Trials at Shrewsbury were a tremendous success, the entries being more in number than they ever were before, though I fancy the quality of the pointers was indifferent. Mr. Price has I believe determined not to run his celebrated bitch, "Belle," of whom you have heard so much, again in public, but she was ably represented by her daughter "Grecian Bend," who won the bitch's stakes. Viscount Downe sent a crack in the shape of "Grace I," a liver and white bitch of excellent symmetry, and the Duke of Westminster's "Ruth" was another beautiful pointer. In setters the Laverack blood showed up pretty strong, though the winning dogs were not pure Laveracks, but mixed with the strain of Mr. Thomas Statler of Manchester, and many of them being related to a celebrated bitch of his called Phœbe. There was of course nothing entered that could touch Mr. Macdonald's white black and tan setter "Ranger," who has now won every where, having beaten everything but Mr. Price's "Belle" at Bala, last autumn on grouse. He won the Champion stakes with the greatest possible ease. Mr. Llewellyn's lemon and white "Leda" being nowhere, and I hear his owner has had several bitches promised him at the fee of £25. This amount has never been earned before by any dog at the stud with the exception of Greyhounds.

The great disadvantage of Spring Field trials is that you cannot kill birds over dogs, and with young dogs this is often very discouraging, in fact I have often heard of pointers turning sulky, and being disinclined to hunt, when they found that their masters couldn't kill the game when they found it for them, and I can quite appreciate the feeling. It must be very galling to see the birds fly away every time, and to know that you are working hard for a duffer.

—The judges at Shrewsbury, were the Honorable R. C. Hill, the well known pigeon shot, Viscount Combermere, and Sir Vincent Corbet, and though they neither of them run any dogs at field trials yet they are all well known sportsmen.

I should think a field trial might easily be organized in America with very little trouble or expense, and if the ball was once set rolling, no doubt it would be kept in motion.

—The Crystal Palace Dog Show will be held next month under the management and rules of the Kennel Club. Its

entries are not yet closed, but there will in all probability be at least a thousand dogs exhibited of every description under the sun. The Palace being close to London, and the fashionable resort of many sightseers and pleasure seekers, it is a capital place for an exhibition of this sort, and arrangements are made to give every comfort to dogs exhibited. This year there will be a foxhound, and harrier class, and a handsome cup is offered for the best greyhound who has actually made himself a reputation as a public runner. It is on the card that the Prince of Wales will exhibit as he has done in days gone by, and it is said, has signified his intention of joining the Kennel Club. About £1200 will be distributed in prizes, and it is far the best dog show of the year.

—I do not know if the "Battue" is as yet an institution on the other side of the Atlantic; I presume not. I should think that sportsmen who had once killed pinnated grouse on the prairies, and seen the tracks of a grizzly or stalked a moose would have but little sympathy for indiscriminate slaughter of several hundred pheasants. But here in England the steam plough, and high farming have made, and are making game scarce, and there would be no pheasants if we did not breed them, though we have fallen into the abuse of breeding and rearing them in such enormous numbers that the covers about Christmas time are alive with them. They of course have to be fed and watched all they are tame as fowls. The "Battue" is everywhere abused, but it survives its excommunications like most heretics. No body was ever yet known either to express a liking for it or to refuse to go it. About this time the keepers are in the covers collecting eggs for next Christmas *auto da fe*, but a great many are purchased from dealers who are supposed to "raise them" in covered runs and the usual price for the eggs is twelve shillings a dozen. The poachers of course do a lively trade, and it is by no means unusual for a man to buy his own eggs after all, from the dealers. The eggs are generally hatched under turkeys, and a large yard is made in a warm place in the park, and the coops are carefully screened from wind, and watched by dogs and men day and night. Hawks are great enemies to the young birds, and posts with traps are usually provided for their especial accommodation whilst their intended victims run under the branches of trees laid on the ground at their approach. The feeding and rearing is quite a science and every bird killed costs at least a couple of sovereigns, whilst the sport costs many hundred pounds an hour in some covers. At the Battue few people begin much before two o'clock in the afternoon, and comparatively few birds are killed in each cover till the last moment, as it is their nature to run, and then are allowed to carry out the full bent of their wishes, but they only run in to the farthest corner of the cover where the privat and gorse has been "splashed" down and pegged, and holds them like a net till the guns come up. Then begins the sport, if sport it is. As the beaters poke them out, they rise in what are termed bouquets, twenty or thirty at a time. The air is thick with smoke and feathers, every one has two breech-loaders and a man to load, and sometimes the unfortunate pheasants receive the contents of two or three barrels. At one of these "hot corners" as they are appropriately named, I have found my guns when we left off so hot that I could scarcely touch them, from continual firing. Of course in this "hole and corner" work the pheasants have not time to rise properly, and are knocked down before they are really on the wing, but it is quite a mistake to suppose that a "rocketing" old cock is an easy thing to hit, or that he bears any comparison to a barn door fowl. Let him get well up, with a little wind, and come over your head forty miles an hour, you must shoot well in front, and canily, to touch him.

The chief part of an English Battue is the lunch. Sportsmen at one time were content with bread and cheese, and cider, but "*nous avons changé tout cela*." Luncheon is brought out in the woods in a pony cart, and kept warm in what is termed a Dutch oven, an ingenious combination of hot water and spirit lamps. There are rugs and campstools to sit upon, and all those luxuries which you see on the Derby day, at Epsom, whilst the *finale* is generally liqueurs and Havanas, whilst the keepers and beaters who wear a white smock with a red cross on it, seize on the fragments that remain and fall to.

—I hope next week to touch upon grouse shooting on the Scotch moors, and I am happy to say that at present we seem likely to have plenty, both of grouse, and partridge. Last year's season was perhaps the worst ever on record, there being no grouse anywhere except in Wales.

INSTONE, JR.

Morden Vicarage, Blandford, Dorset, England.

THE DODO.—Dr. A. B. Steinberger, whose recent visit to the Navigator islands is the subject of a highly interesting report to the Secretary of State, made a discovery in the course of his explorations upon which he prides himself greatly, relating to the present existence of the dodo, a bird long supposed to be extinct. It is the tooth billed pigeon, having three teeth upon either side of the lower mandible. The doctor has brought home a living specimen and also a dead specimen preserved in spirits. In regard to its habits he says that "it is a timid bird, lonely in its habits, exceedingly scarce in number, and only found in lonely and almost inaccessible parts of the mountains," and in regard to the value of his discovery he says:

"For about two centuries past the few remains of this bird known to the scientific world, as a foot or a head, together with some paintings made of it in the seventeenth century, have been preserved in European museums with

great care, and have been regarded as of great value. Several scientific treatises upon it have been contributed to learned societies within the last fifty years, but so little has been known of it by naturalists that they have not been agreed as to what family it belonged, or what were its habits. Ornithologists will doubtless recognize in these specimens an extremely valuable acquisition to science, and improve the opportunity now offered of making a thorough acquaintance with its peculiarities and of determining its proper classification."

Shot Gun and Rifle.

MAY IS A CLOSE MONTH FOR GAME.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

GENERAL ADVICE FOR CREEDMOOR.

COMPILED FROM VARIOUS SOURCES.—No. I.

THE possessor of a sound constitution, keen eye, steady hand, and good judgment can, without much trouble, become an expert marksman. Many people think that good shooting depends upon "nerve," but I have known gentlemen with a superabundance of nervousness who are good shots.

Some poor shooters say they never can become good marksmen, but they are mistaken, for if they would only make an effort they would improve, and soon, by perseverance, would become well skilled. They may be unsuccessful at first, but by receiving instructions from expert marksmen, and reading reliable books, they cannot fail to succeed.

RULES FOR SHOOTING.

Before shooting, get yourself in as good physical condition as possible, sleep naturally, and take moderate exercise and substantial food.

The eyes are in a great measure affected by the digestion, therefore you should not eat, drink, or smoke to excess before or during a match, for any over-indulgence will affect them; but if in the habit of smoking or drinking moderately do not give them up for a few days before shooting, for you will not gain, but might lose thereby. It is unnecessary to train yourself by an excessive use of dumb bells or gymnastic apparatus. If you think that your dress has nothing to do with your shooting, you are quite mistaken, as your attention must not be taken from the shooting, and nothing will do it more than a tight shoe or a bad fitting coat, which cuts you under the arm. I think a soft felt hat, with a wide brim, is the best kind to use while shooting, and the coat and pants should be loose, plain, flexible, and such as will not spoil by either sun, rain, or a little mud, for remember that comfort, and not appearances, should be consulted by those who wish to win.

Your rifle should suit you, for if it does not you will never be apt to make good shooting; and always remember that it should be kept like yourself—in the best possible condition. One night's rusting does it more harm than one year's shooting.

There is no end of patterns of sights. You should try them all until you are suited, and after that you should never change. One kind of sight might suit one person's eyes and not another's. For this very reason you should try the different ones yourself.

Load your own cartridges, as you will then know the exact amount of powder you are using, for five grains will change a bulls eye into a miss at 1,000 yards. When you buy the ammunition already made up it might be imperfect, and when fired the ball might fall short of the mark. Do not hesitate to pay a little more for a pound of powder, and get the best, for the finest rifle will rapidly foul with inferior powder; and who can shoot with a foul barrel? The variable nature of poor powder is enough to spoil the most careful efforts, even with a clean barrel, and destroy the shooter's confidence in himself and his rifle. The best plan is to lay in a quantity of powder enough to last during the shooting season, and before using shake it up, so as to have the smaller grains united with the larger ones.

Be as careful with the bullets as with the powder, and see that they are all of equal weight. Keep the cartridges in a dry place, for the saltpetre, which is about seventy-five per cent. of the powder, is affected by moisture. Powder that has become once damp and caked is worthless for fine shooting, even if nicely dried. It will never regain its original strength or uniformity. If you use cartridges with different charges, be careful to keep them from getting mixed.

Always have a score book, keeping a record of every shot fired; also a diagram of the exact position of the shots, the distance, time, kind of day, etc. Then, on going home, you can study your book, and perhaps find out why it was you did not do better, or, if your shooting is good, how it is that you have improved. Before shooting always look and see that the sights have not been moved while cleaning, or by an inquisitive friend, who "wants to see how they work."

The rifle should be held firmly, but not so as to over exert the muscles. This is one of the greatest mistakes a new beginner can make. The muscles of the arm become tired, and thus the aim is made unsteady. The main point in holding the rifle is to get an easy position, so that after remaining several minutes your muscles will neither become cramped nor over tired. This can only be secured by practice, and may be acquired in a room at home, and by watching old and experienced shots. Do not attempt any

unnatural position, as it has a tendency to unsettle the mind, and create a certain amount of over-confidence, which is just as likely as not to spoil a promising score.

Place the centre of the heel plate of your rifle against your shoulder, and not the toe of the but, for when the rifle recoils, and you have pressed the toe of the but to your shoulder, there is a tendency to throw the muzzle of the rifle up.

[To be continued.]

BULLS I.

ENGLISH RIFLE MATTERS.—The change in the targets may be considered now a *fait accompli*. There has been some slight modification as to the method of marking, as may be seen by the following notice, published by Captain E. St. John Mildmay, Secretary of the National Rifle Association:—"I am directed to state that the National Rifle Association have adopted the proposal of Major Bland, viz., to attach a small disc to the shot hole in the *real* target, in addition to the large disc in the *dummy* target. Major Bland's suggestion will tend to make the National Rifle Association's scheme more perfect," etc., etc. The *Volunteer Service Gazette* explains the somewhat roundabout method in this way:—

"It is intended, we believe, to have a small disc, which will be easily hooked upon the paper target. This disc will be black on one side and white on the other, and will be used in combination with the dummy marking. When the shot strikes the target the large disc will be hung upon the dummy in the proper place, the dummy sent up, and the real target lowered into the trench. The marker will then paste a patch over the shot hole, and hook the small disc over the patch—white to the front if the shot be a bulls eye, and black to the front if it be an outer, inner, or centre. He will then lower the dummy and raise the target. The shooter will see the exact position of his last shot remaining on the target till he fires the next, when the process will be continued, there being, of course, only one small disc, and therefore only one shot marked upon the target at any given time." * * *

Now this is all very well in its way, but we must take the liberty of remarking that it seems to us very much like that famous powder for killing fleas which Captain Marryatt tells about. The trouble might arise that the marking on the two targets—the dummy and the real one—might differ slightly. The *Volunteer Service Gazette* advises the use of fine binocular glasses, through which the competitor might look if he desired. We might as well mention here that quite a number of good glasses, to be the property of our National Rifle Association, would be found useful at Creedmoor.

—Mr. John Boylan has presented to the regimental rifle club of the Twelfth N. G. a handsome gold medal, which is to be shot for at Creedmoor on the following terms:—Once per month, distance 200 and 500 yards, seven shots at each range; weapon, any military rifle, under the rules of the National Rifle Association, to be won three times by one person before owning. The first match will take place some afternoon next week. The medal is shield-like in form, having the figure "12" suspended above it, the whole being attached by gold chains.

—There are to be two matches during the present week between members of the Seventh and Twelfth regiments. There will be another match on May 30th for a badge by the Amateur Rifle Club; distances, 800, 900, and 1,000 yards.

—Our representative in the western States, J. G. True, sends us the following score of the pigeon shooting match for the Michigan State Medal, which took place at Detroit last week. There were thirteen entries, fifteen birds each. The day was warm, and the wind blowing slightly. The judges were Henry Harris and Silas M. Allen, Secretary New York State Association. Scorer, J. G. True:—

STATE MEDAL MATCH.

Name.	Straight.	Killed.
W. J. Mason,	4	10
M. H. Christy,	7	12
L. Dubois,	5	withdrew.
J. Noovell,	2	withdrew.
J. V. D. Eldridge,	5	10
E. Fisher,	4	10
J. E. Long,	5	11
E. H. Gilman,	5	11
Goff Stanton,	1	withdrew.
W. C. Colburn,	10	13
J. J. Berger,		withdrew.
H. W. Babcock,	3	11
P. Jones,	4	withdrew.

The medal was won last year by E. H. Gilman. W. C. Colburn, having killed thirteen birds out of fifteen, is now the holder. After the Medal Match had been decided, the members shot off three sweepstakes. We have to thank the members of the Shooting and Fishing club of St. Clair, and especially Mr. John E. Long, for the many kind favors extended to our representative.

—Our correspondent, "Chit," says Chicago is the headquarters for pigeon shooters, and can produce as fine shots as any other city in the Union. Her clubs number no less than four, any of which will send from one to twenty members against the same number of shots, for money or pastime. He sends a score of a match which took place last week by two members of the Kennicott club, fifty birds each, club rules to govern:—

Name.	Straight.	Killed.
Sampson,	9	34
Orndorf,	27	44

—Mr. David Crocker, Jr., of Philadelphia, sends us the following:—"At 40 yards distance, with my gun charged with 1½ oz. No. 7 shot, I put 234 pellets in a twenty-eight circle. My gun is 7½ pounds weight, pin fire, 32-inch laminated steel barrels, made by W. W. Forsyth, St. James,

London. What do you think of this result?" [A letter from "Engineer," in this issue, will answer the above query.—Ed.]

—We congratulate the world of sportsmen and game conservators upon the organization of the "Sportsman's club of Western Pennsylvania," which we have alluded to briefly in a previous number of this paper. A very important section of country lies within its jurisdiction, embracing as it does several of the wilderness counties of the State, and isolated tracts where the need of protection is sorely felt. Great destruction is caused by netting and shooting out of season, and especially in an indirect way by the encouragement given to poachers, who bring illegal game from Virginia and North Carolina to sell in Pennsylvania. It will be the province of the Sportsman's club to put a stop to this, as one of its chief objects is to enforce all laws and ordinances against the unlawful killing of game. The officers are:—Robert Dalzell, President; D. C. Phillips, Vice President; O. T. Wharton, Secretary, and J. E. Harper, Treasurer. A large number of the members are subscribers to *FOREST AND STREAM*, which, of course, accounts for their enthusiasm and energy.

—We can personally attest to the value of Rigg's Belmont oil as a prevention against rust, and we are sure, from the number of testimonials appended to the circular which accompanies the preparation, that others consider it an excellent article also. It seems to form a cuticle which prevents either local water, or hygroscopic moisture from touching iron, steel, or brass. It is not intended as a lubricant. Iron manufacturers, machinists, and sewing machine makers, all use it.

—The Worcester, (Mass.) Sportsman's Club have elected the following officers for this year:—President, John Boyden; Vice-President, A. P. Cutting; Secretary and Treasurer, J. C. Bates Smith. This club has about seventy active members.

—There is no definite date fixed as yet for the Tournament of the New York State Association at Oswego.

WHAT SHOULD A GOOD GUN DO?

EDITOR *FOREST AND STREAM*.—

I observe that an expert tried a couple of Remington shot guns for you some time since, that you published the same, and have subsequently alluded in your Answers to Correspondents to the performance, as a good one. Your expert did not give the size of shot used; but if it was the American standard No. 7, both pattern and penetration were fearfully low. Using the English standard paper, or "Pettit's pads," as they are termed, with No. 7 shot, American standard, or any shot which runs from 280 to 295 pellets to the ounce, and at 40 yards distance a good average gun should put 125 shot in a thirty-inch circle, 17 shot in the centre pattern (the ten-inch square centre pad used for determining penetration), and of these seventeen shot, one-half should penetrate eighteen sheets of paper, the deepest shot being at or about 23 sheets. A very good gun should show a pattern of 180, a centre pattern of 32 to 35, and two-thirds of the centre pattern should show through at 18 sheets. The two best guns in the New York trial of last fall ran up to a pattern of 212 but the penetration was unreliable, owing to the bad quality of the paper. I would suggest that in future trials (and I would be glad to see as many as possible made under your auspices), that your expert should adhere to the standard shot, distance, paper and size of target which have obtained prominence in all the public trials up to date. The paper pads can be had of Pettit & Co., Frith street, Soho, London, or McLaran & Williams, St. Louis, who have imported a large number of them.

I observe, also, that in your "Answers to Correspondents" you state the old formula, viz: That to improve the pattern use less powder, and that an increase of powder scatters the shot, but improves the penetration. This is erroneous, except in certain cases. Both pattern and penetration improve with an increase in the powder charge until a maximum point is reached, after which the pattern first begins to spread and becomes irregular, and then the penetration falls off as the recoil becomes greater, unless the charge of shot is reduced as the powder is increased, so as to keep the recoil at the same point. The performance of a No. 10 Dougal, which I tested lately, will serve to illustrate this fact. Six shots were made to each charge:

- $\frac{3}{4}$ drachms and $\frac{1}{4}$ ounce shot; pattern 129; penetration 15.
- $\frac{3}{4}$ drachms and $\frac{1}{4}$ ounce shot; pattern 132; penetration 16.
- $\frac{4}{4}$ drachms and 1 ounce shot; pattern 166; penetration 22.
- $\frac{5}{4}$ drachms and 1 ounce shot; pattern 132; penetration 19.

Trusting that your expert will continue to test guns for the benefit of your readers, I remain very truly yours,

"ENGINEER."

[The penetration and pattern was confined to the 8-inch bullseye, and we consider excellent shooting. The size shot used was standard No. 7.—Ed.]

THE COMING JULY WOODCOCK SHOOTING.

PHILADELPHIA, Penn., May 14, 1874.

EDITOR *FOREST AND STREAM*.—

Woodcock shooting this summer, I doubt not, will be poor indeed, for from every quarter I hear reports of the almost total destruction of the young broods by either flood or cold, owing to the heavy rains in the Middle States and the unseasonable snows in the more northern latitudes. In ordinary spring weather and where the birds are at all favored, they hatch their young by the middle or latter part of March, even earlier at times; but the present season has been so backward the woodcock did not reach their breeding grounds before the last of March, and consequently their broods were brought forth about the third week of the following month. Northern Pennsylvania, New Jersey, and Southern New York experienced a heavy snow on the 28th and 29th of April, and throughout the entire Eastern and Middle States the storm was felt, either in the form of snow or rain, to such an extent as to be fatal to the young woodcock in every section. A host of old birds settled in Sussex county, N. J., this March, paired and bred, and everything favored capital shooting for the summer; but the snow killed the greater portion, and a second brood will now be raised by the parents, which, when the fall allows them to be shot, will be hardly half grown. Granting that woodcock are four years out of five in full condition to be killed in July, how much better, how much more sportsmanlike it would be to allow them to remain unmolested until autumn, when no doubt can exist that they are in full plumage, strong and vigorous on the wing and without the cares of a family?

In the year 1841, as late as the 5th of May, just such a snow and rain occurred as we have experienced the present spring, and in July of the same year woodcock were shot, afterwards found to have been nesting. Many a parent will be destroyed rearing young this summer likewise. I will not say intentionally, but through ignorance.

"HOMO."

[We agree with our correspondent as to the eminent wisdom and propriety of foregoing the mid-summer woodcock shooting; nevertheless we are pleased to state that in parts of Hudson and Essex counties there

is a fine show of young spring woodcock on the farms of our friends. One gentleman of our acquaintance has two pairs of chicks so tame that they come regularly for food which has been placed for them not far from the house. We trust the mortality has not been so great as "Homo" apprehends.—Ed.]

A CARD.

To correct any misapprehension in the minds of sportsmen, arising from the article of "W. L." in your issue of April 20, as to the kind of gun suitable for altering, we beg you will insert the following: "W. L." says "the hooks of the muzzle-loader must be taken out, the barrels cut off, and a chamber bored. Now if the gun was not of sufficient thickness after the chamber was bored, the gun would be unsafe. The heel plate is done away with and replaced by tips; this requires another removal from the old stock. Therefore, it is not safe to send any and every gun to be altered, but only those guns which have thick barrels and are, as muzzle-loaders, fine shooters." In reply we would state that any and all muzzle-loading guns can be altered to breech-loading, if metal shells are used, as the metal taken from the barrels to allow their insertion is so trifling as not requiring consideration, when the fact is well established that a gun barrel will stand the most excessive charges of powder when burned in a metal case, whereby the gas generated is kept from contact with the naked metal of the barrel at the breech, for without the shell, if there were any flaw or defect in the texture of the barrels the gas would force itself into them, and tear the barrels apart, but protected by the shell there is no danger. In experimenting we have seen a barrel standing seventy discharges when the metal shell was used, burst at the second discharge when the powder was burned, the naked barrel showing, on examination, that the gas had forced itself through an imperfect welding of the coils. Paper shells, requiring so much more metal to be taken out for their insertion, can be used only in guns having a certain thickness; a few guns do not possess it; they are the exception. A fine shooting gun is not injured by the alteration; a poor shooting one can be made to shoot properly. With the exception of new hammers, the old stock, with its locks, cock length and mountings unchanged, is retained; for the "hooks, false breech," or more accurately, patent breech of the muzzle-loader, is substituted the solid breech of the breech-loader; the barrels are shortened never more than half an inch, usually less.

In conclusion, we would assert that any gun, safe as a muzzle-loader, is safer, using metallic shells, as a breech-loader.

CLARK & SNEIDER.

Baltimore, May 11th, 1874.

Yachting and Boating.

All communications from Secretaries and friends should be mailed not later than Monday in each week.

HIGH WATER, FOR THE WEEK.

—Herewith we append the log of the sloop yacht "Vindex," Captain Robert Center, N. Y. Y. C., which has just returned from a cruise in southern waters, giving the run from Savannah to New York, believing that it must prove interesting to our yachting readers, considering the inclement season in which the voyage was undertaken:—

LOG OF THE "VINDEK."

Monday, April 20th.—Got under weigh with pilot at 2:30 P. M. Wind south, and light. Came to anchor off Tybee; weather threatening; discharged pilot; night moderate.

Tuesday, 21st.—At 7 took pilot from pilot boat "Nicka," and got under weigh in company with her for Fishing Banks, where we have to. The scrub match arranged previous to starting resulted in favor of the Vindex. Wind S. S. W., veering to S. S. E.; light. Fished until 12:45, at which time parted company with pilot. Shaped course N. E. at 1:15; had Martin's Industry bearing N. W. distance 5 miles; at 4 P. M. Wind S. S. W., and very light.

Wednesday, 22d.—At 2 A. M. wind shifted N. E., veering E., and continued light until 12 M., at which time fell flat calm. Lat. by observation 32 degrees, 59 minutes. Sounding, found 19 fathoms at 2 P. M. Wind N. and light, shifted to N. N. E. at 3, and increasing, and 4:30 wind N. E.; furled topsail and housed topmast. At 11:30 wind hauled to south.

Thursday 23.—Wind S. E., at 1:30 A. M., double reefed mainsail, got jib on deck, wind strong, hauled off shore on course E. by N. at 6 A. M., course E. by N. $\frac{1}{4}$ N., took soundings, got twenty fathoms. At 7 wind moderating bent jib without bonnet. At 8 bore away on our course and shook out one reef in mainsail, and at 9:30 set whole mainsail. At 11 wind S. found no bottom in forty fathoms. Course N. E. $\frac{1}{4}$ N. Lat. by observation, 34 degrees 03 minutes. At 12:30 got topmast on end and set gaff topsail at 7:30, wind increasing, took in top sail. At 9 still increasing, double reefed mainsail. At 10 strong wind from S. S. W. with heavy sea running.

Friday 24.—By dead reckoning having passed Hatteras hauled up N. At 3 wind shifted to N. in heavy squall, stripped ship, housed topmast and got jib on deck; set trysail and fore stay sail without bonnet. At 3:30 wind veered to N. E., tacked ship and stood in to N. W. At 9 A. M. put bonnet in staysail. At noon lat. by observation 35 degrees 20 minutes. In twenty-four fathoms of water. At 1 twenty-two fathoms. At 1:30 took in trysail; set double reefed mainsail whole foresail, jib without bonnet. At 4:30 made Body Island light bearing S. S. W. eight miles distant. At 6 wind strong N. E. took jib off bowsprit and set trysail.

Saturday, 25.—Blowing hard from N., but moderating towards 4, wind veering N. E. with fog. At 7 set double reefed mainsail. Wind S. E. at 8, set jib. At 9 set whole mainsail, wind S. E., thick fog, took soundings in twenty fathoms. No observation. At 1:30, clearing weather, wind S. W., freshening with rain. At 3:30, made land. Wind shifted W. and squally at 6, and at 7 was obliged to put double reef in mainsail and take jib off bowsprit. At 8 blowing hard and smothering yacht into it, took three reefs in mainsail and bonnet off fore stay sail. Made Cape Henry Light bearing N. by W.

Saturday, 26.—Abreast of Cape Henry, blowing hard, hauled up to beat inside of Capes at 2 A. M., had gotten a mile further to leeward, but by making short tacks under Cape Henry at last got in, wind moderating about 5, shook out a reef and put bonnet in fore stay sail. At 7 abreast of Thimble Light, bent jib and set it after passing Sewell's Point, let go anchor at 11 off Norfolk.

Wednesday, May 5.—At 8:30, A. M., got underway with

light, N. W. wind for New York. At 1, calm. At 3, wind N. N. E. veering to S. S. E. At 7, off Cape Henry, calm. At 8:30, light breeze sprung up from S. W. Cape Charles, bearing W. at 11.

Thursday, May 6.—Wind N. W. Hog Island Light, bearing W. at 2:30. Took in gaff topsail at 3 and set it again at 5, wind N. At 7 wind N. by E., Chincategui Light due W. at 9:30. At 10 wind was N. E., hauling E. by N. At 11 set jib topsail, wind hauled S. E. by E. and remained light for balance of evening. At 1 Five Fathom Light Ship due W., wind freshening and veering S. W., took in jib topsail, and at half past 6 the topsail. Absecum Light bearing W. N. W., jibed over and set jib topsail. Barne-gat bearing W. at 10, at 11 wind shifted to W. flawy and strong. Called the watch, took in jib and gaff topsails and double reefed the mainsail. At 2:45 the black buoy off the point of the Hook bore W. Stood on up to the city. Wind lightening in the Bay. Set whole sail, passing Battery at 4:15. Came to anchor off 27th street at 6.

NOTE.—Saturday 25th of April, which log of *Vindex* describes as blowing hard, we understand ocean steamers postponed their sailing.—Ed.]

—The schooner yacht Josephine, Mr. Lloyd Phoenix, has been hauled out at the yard of Mr. Henry Steers, and will have the bowsprit gammoning, and stem strengthened before she is again launched.

—The schooner Prospero, new last season, and designed for Mr. Comptoir by the eminent marine painter and naval architect, Mr. A. Cary Smith, is again in commission, having been thoroughly overhauled, her decks planed, and her bottom coppered. The Prospero has not been sparred and canvassed for a racer, but with the cruising sails her owner used last season she has shown great speed, notably upon the occasion of the fall regatta of the N. Y. Y. C.

—A regular meeting of the Seawanhaka Yacht Club was held on Friday, the 15th instant, at Delmonico's. After the routine business for the evening had been finished the club proceeded to the election of new members by ballot, and ten candidates were admitted, among whom were the owners of the Restless, Vindex, and Gracie. The flag officers of the club, Commodore W. L. Swan, Vice Commodore J. Wm. Beekman, and Rear Commodore S. J. Colgate, signified their intention of giving a prize for cabin sloops, to be sailed for under the Corinthian system on the 3d of July next. The club then elected as a committee for the arrangement of all necessary preliminaries the same gentlemen who are now serving in a similar capacity in connection with the Seawanhaka Yacht Club's Corinthian cup for schooners. As yet no details for a sloop race have been decided upon.

—The Sadie, one of Herreshoff's most successful boats, is now owned in New York, and has established her moorings off the residence of her owner, Mr. Ford, of New Brighton, Staten Island.

—The schooner yacht Clio, Messrs. Asten and Bradhurst, it is rumored, will sail another match race with the Eva. It will be remembered that there was a private match between these yachts, on the occasion of the Cape May race last fall, which was won by the Clio.

—The Rev. Mr. Aspinwall has a steam yacht, seventy-five feet on deck, building for him at one of the Long Island yards.

—The schooner yacht Restless, Mr. George De Haven, is preparing for the coming season, and almost ready to go into commission.

—The Bayonne and Pavonia yacht clubs have combined forces under the name of the Union Yacht Club of New Jersey. As soon as a suitable location has been decided upon they intend building a new club house.

EAST BOSTON YACHT CLUB.—A new yacht club was organized on the 7th instant in East Boston. A constitution very similar to the Bunker Hill club was adopted, and by-laws read which will be acted upon hereafter. A committee of four was appointed to nominate at the next meeting a list of officers, and another committee of three to consider the feasibility of getting rooms and making other arrangements for the club. At the meeting about ten yachts were represented.

ON THE WAVE.—Gentlemen in Boston having at heart the welfare of aquatic sports, have inaugurated measures to bring together, if possible, all the leading oarsmen of New England—both professional and amateurs—in a regatta to take place on Charles River June 17. Gold medals will be offered, one valued at \$125, for professionals, and another worth \$100 for amateurs, in single sculls; and also medals for four-oared sculls, Whitehall, and working boats. An efficient committee, of which Mr. Thomas Butler is a member, is at work perfecting the arrangements. Among the rowers who will probably enter the races are Pauden Harrington, of Springfield; O'Leary, of Worcester; Landers, of Salem; Randall and Brown, of Portland; and McNulty and several others of this city; and double and four-oared sculls, including the North End, Howard, and Shawmut clubs, and other crews.—*Boston Journal*.

—The Arlington Yacht Club held their annual meeting May 4th, and after transacting the regular business of the evening proceeded to the election of officers for 1874, with the following results:—Commodore, S. P. Prentiss; Vice Commodore, John Gray; Secretary and Treasurer, Thos. Gray; Measurer, N. B. Walker. The first regatta of this club will take place May 30th, and the regular annual regatta on the 4th of July. This club is in a most flourishing condition, and have enrolled on the books the following yachts:—Angie, Mr. W. G. Peck; Adelaide, Mr. H. K. Osborn; Alice, Mr. E. W. Richardson; Agnes, Mr. C. W. Chamberlain; Blue Bird, Messrs. T. and J. Gray; Edith, Mr. S. F. Hicks; Fannie, Mr. W. L. Frost; Helen, Mr. R. W. Hopkins; Lilian, Mr. F. H. Peabody; Millie, Mr. T. G. Bucknam; Nellie, Messrs. J. J. Eaton, Jr., and S. P. Prentiss; Nameless, Mr. F. H. Peabody; Yankee Blade, S. P. Prentiss; Clara, F. E. Peabody. The measurement adopted by this club for time allowance in regattas is based upon length on the water line.

—The Portland Yacht Club has chosen the following officers for the ensuing year:—

Commodore, A. M. Smith; Vice Commodore, John P. Thomas; Fleet Captain, Howard Knowlton; Secretary and Treasurer, George W. Holden; Measurer, Joseph W. Dyer; Trustees, A. M. Smith, ex-officio, Charles T. Richardson, Henry T. Carter, R. I. Hall, and George H. Holden, ex-officio; Regatta Committee, A. M. Smith, B. J. Willard, William Taylor, J. Hall Boyd. Howard Knowlton, the fleet captain, is building a fine new steam yacht for his use. There are several other yachts being built, which will belong to the club. Charles M. Goodrich is building a fine

yacht at Decring, and there is also one building at the Cape. The club is making preparations for a whole season of yachting.

—A yacht club has been organized in Haverhill, with officers as follows:—Commodore, John Hanson; Vice Commodore, John Goodell; Captain of Fleet, George Hoyt; Secretary and Treasurer, E. F. Brown. The fleet is composed of thirteen boats, varying in length from eighteen to thirty-eight feet. One is a sloop built of iron, owned by Henry Votter. Early in June they will go on a yachting trip to Provincetown and other points on Cape Cod.

—The Haverhill yacht club will have regattas on the Merrimac on the 30th instant, and on the coming 4th of July.

—The first race of the season under the auspices of the Philadelphia Yacht Club came off on the Delaware on May 18. The course was from Kensington wharf to a buoy below the block house and return. There were eighteen entries for first class yachts and thirty-two for second class yachts. The winning boats arrived in the following order: First class—William Kleintz, first; Albert Dager, second; and Albert Eggleston, third. Second class—Charles F. Riddle, first; John B. Brewer, second; and S. A. Stamford, third. The Jouty Hillman ran aground near League Island flats; the Ida May upset, but her crew were rescued, and the Sallie was disabled by the loss of her halyards.

—The "Goodwin Cup," won by the schooner yacht Sylvie, in England, some twenty years since, has been offered by Mayor Barker, of Detroit, as a prize for an international race, to be sailed this season on the lakes, between yachts of the United States and the Canadas.

—Mr J. Buchanan Henry's steam yacht, building for him at Philadelphia, is very nearly completed. She is said to be of remarkably fine model, and is ninety feet on deck. Her anchorage for this summer will probably be off Stapleton, Staten Island.

—Both the university and freshmen crews at Yale are doing their regular work. They practice every evening from six to seven o'clock, and on Wednesday and Saturday afternoons. D. H. Kellogg has been chosen as substitute for the university crew.

—The Dartmouth students have raised \$1,200 to pay the boating debt and send the crew to Saratoga, though the six is not chosen as yet.

—The Harvard spring races will be rowed June 3d. Crews will be entered by the junior, sophomore, and freshmen classes, and by the scientific school.

—The Harvard freshmen will not send a crew to Saratoga.

—The Columbia crew has been taking steady gig practice during the week, coached by Messrs. Benson and Reeves, formerly of Cambridge University. Mr. Reeves rowed stroke in a four, while Mr. Benson coached from the stern the other day. The stroke was no faster than thirty to the minute, and, being so slow, it was followed with difficulty by those behind Mr. Reeves. Towards the finish of the practice, however, there was improvement enough to show that the men were striving to catch the new idea.

—The Amherst students have raised enough to liquidate all the debts of the boating association, and to leave a surplus sufficient to defray the expenses of the coming college regatta on the Connecticut River near Hatfield. The crews go into training at once.

—The students of the Wesleyan University have subscribed liberally towards the expenses of their boating brothers, enabling them to have every facility for training, etc. The university crew is composed of the following gentlemen:—John E. Eustis, Hammond, N. Y., stroke; C. P. Marsh, West Newton, Penn.; G. M. Warren, Deer Isle, Me.; C. A. Waldo, Gouverneur, N. Y.; J. W. Whitney, Sprague's Corner, N. Y.; W. H. Downs, South Berwick, Me.; bow; H. C. Hermans, Corning, N. Y., substitute. They will row in a new shell, now being built for them by Elliott, of Greenpoint, and will use the sliding seats. The quarters of the crew at Saratoga have been selected in a choice spot on the shore of the lake, and they will probably occupy them June 28th.

—On Saturday last Mr. R. W. Rathbone, of the New York Athletic Club, rowed over the course on the Harlem River for the mile championship medal of the club. In 1873 he twice won this medal, once in a contest with Mr. C. H. Cone, and once in a race between himself and Mr. McCreedy. On Saturday Messrs. Cone, McCreedy, and Sprague were to have rowed against Rathbone, but withdrew on plea of lack of condition. This occasion makes the third time Mr. Rathbone has won the medal, which now becomes his personal property.

—Panrapo, New Jersey, facing New York Bay, has been selected by the members of the Triton boat club for the site of their very handsome boat house. The view from the piazzas of this building is most beautiful, and there are many other advantages which render this position one of the most eligible for a rowing club. Staten Island, acting as a breakwater, generally gives a smooth surface for rowing, and the extreme shallowness of that part of the bay prevents its being used to any extent as a thoroughfare by steamers and sailing vessels. The club is composed of gentlemen engaged in business in New York, and although but a year old has already attained quite a reputation for oarsmen. At the meeting held a few days since the following officers were elected:—President, Frank W. Gifford; Vice President, Chas. Edwin Hoe; Secretary, George I. Wickman; Treasurer, W. H. Stevens; Captain, Chas. E. Connor, First Lieutenant, Thos. Allaire; Second Lieutenant, Wm. T. McRae.

—The following letter from Galveston shows that some interest is beginning to be felt there in yachting:

GALVESTON, Texas, May 10, 1874.

EDITOR FOREST AND STREAM:—

A new era has dawned upon us. We are now forming boat clubs. A very large one of some 150 members is making arrangements for a boat house, and has already given the order for six oared boats. These six with other yachts and boats belonging to other parties, two coming out from New York, will make a handsome fleet. We think we will have some fun this summer. You may expect to hear from me again upon other topics appertaining to general sporting themes. Yours very truly, J. L.

OUT DOOR EXERCISE AND OPEN AIR RECREATION.—Seven convicts, five of them colored, were whipped at Newcastle, Del., on Saturday. One of them had twice before enjoyed the same exhilarating pastime.

Sea and River Fishing.

FISH IN SEASON IN MAY.

Salmon, *Salmo Salar*. Salmon trout, *Salmo confinis*.
Trout, *Salmo fontinalis*. Shad, *Alosa*.
Land-locked Salmon, *Salmo gloyeri*. Michigan Grayling, *Thymallus tricolor*.
Black Bass, *Micropterus salmoides*, *micropterus nigricans*.
Striped Bass, *Labrax lineatus*.

The amended fish law of New Jersey prohibits the taking of black bass within the State before the 1st of June.

For complete fishing outfit and instructions for camping, see FOREST AND STREAM, Vol. 1, pages 153, 186, 200, 217.

—Our fish market is still bountifully supplied. Shad are, however, falling off. It seems as if the season for shad will be short. When they did come they were in quantity. It is too early for us yet to form any estimate of the total catch. One thing seems certain, that shad have been finer, larger and in better order than for many years. Sea bass, royal indigo looking fellows from Rhode Island, are beginning to be plenty. Mackerel have left our immediate shores and are not working further north. Salmon are not as plentiful for the season as they should be. They are scarce in Maine and have not come to us as yet in quantity from the Provinces. This time last year salmon was worth thirty-five cents a pound; this week salmon is selling at fifty cents. California salmon plenty; worth twenty-five cents a pound. That queer specimen of the crustaceans, the soft crab, is making its appearance.

—Weak fish and flounders are entering the estuaries on the Jersey coast in considerable numbers. The porpoises having put in their appearance for the season, salt water fishermen are now beginning to prepare for the usual summer sport.

—A Greenpoint paper says that Menhaden fishing began in good earnest on May 12th, when many of the gangs made large catches, some of them "setting" close to the wharves. On Wednesday Capt. Ja's G. Winters, of East Marion, took 115,000 at one set, and on Thursday Capt. Israel Warner and J. Conklin Corwin, of Greenport, by putting their nets together enclosed an immense body of fish from which they filled all their boats, saving 220,000 and allowing the remainder to escape. Other gangs have been almost as successful. The fish are of fair quality. Eatable fish of various kinds were never more plenty. Porgies weighing 2 lbs. each have been sold at two for one cent! Shad have been taken in considerable numbers, but they sell high, 75 cents a pair.

—On May 12th three wagon loads of saltwater perch, mostly good sized fish, were taken at one haul at Westhampton. It is said the Bay was never fuller of these fish than now. Indeed, all kinds of fish usually found in the waters of Long Island at this season are said to be uncommonly abundant. In the city markets fish of nearly all kinds have latterly been almost a drug, selling for very unremunerative prices.

—Accompanying the following note was a box of beautiful trout, nicely packed in ice and moss, which we beg to acknowledge with our best bow. One of them made a breakfast for two persons, not invalids. We wish the Bennington Club the best success in its efforts to protect and propagate these beautiful fish in Vermont:—

BENNINGTON GAME AND FISH CLUB, }
Bennington, Vt., May 16, 1874. }

EDITOR FOREST AND STREAM:—

I send you a few trout this day by express that were taken by me this morning in the Walloomack River, in our village limits. I took twenty-one fish last evening and this morning. I send these to show you that there are some fish still left with us, which we propose to protect during the breeding season. Our club is now formed and hope to accomplish some good. Will be pleased to send you a copy when out. Hoping to see you in our beautiful village at no distant day,

I am, very truly yours,

WM. E. HAWKS, Vice-President.

—The Hartford *Courant* notices with disgust a display of diminutive trout at a restaurant in that city, just forty of which it took to weigh a pound. Some law will have to be passed prohibiting the capture and sale of fingerling trout, just as there is of lobsters and several other kinds of fish.

—A Hartford correspondent, T. S. S., speaks of two brothers Bunce, of that city, having caught 120 trout of a fair average size last Thursday; and of Gurdon Trumbull, Jr., the artist, who took, in company with one of the Bunces, 61 good-sized trout on the 8th instant, which is good for the "Nutmeg State."

—A letter from Pike County, Pa., speaks of a string of thirty-five trout, not to mention "small ones thrown back for seed," having been taken at the "Shook House" on the Shohola meadows, and a similar string at Shohola Falls. The woods are on fire, (May 15th,) in all directions—"great fires," the letter says.

—The Oquossoc Angling Association, which has its headquarters on the Umbagog or Rangely Lakes, where the great speckled trout of Maine are found, held its annual election on the 12th May, and chose the following board of officers:—George Shepard Page, Stanley, N. Y., President; G. H. Kimball, Bath, Maine, Vice-President; Lewis B. Reed, Jr., Brooklyn, N. Y., Secretary; F. N. Otis, M. D., New York, Treasurer; Lewis T. Lazell, Brooklyn; William P. Frye, Lewiston, Me., A. P. Whitehead, Newark, and Jas. A. Williamson, Trustees; Lazell, Whitehead, and Otis, Executive Committee; C. T. Richardson, Superintendent. The principal camp of this Association is accessible by the Androscoggin Railroad from Portland to Farmington, thence by stage to Rangely, via the town of

Phillips. The camp is usually opened by members and the late-string hung out about the first of June. A large party is already booked to leave for camp this season at that date. We understand that the President, Mr. Page, has five shares for sale at \$200 each, and as the company is very select, and jealous of its reputation, and the trout fishing the finest that can be found in Eastern America, ownership in the property becomes very desirable. We acknowledge with thanks an invitation to accept the "freedom of the camp" this summer.

71 BROADWAY, May 12, 1874.

EDITOR FOREST AND STREAM:—

I have noticed, with mingled feelings of regret and disgust, at the different places where I have been trout fishing, the immense number of small trout that the anglers bring in with them after a day's fishing. Little fellows of the size of one's finger; they are no use for food, certainly cannot afford any sport to the fisherman. It is done simply to swell the count. Now it seems to me, Mr. Editor, that if you would use your influence against this practice and urge upon the anglers now going forth for the summer, the necessity of returning these young fry to the water. Let them count them if they wish, but put them back to grow larger and wiser. Every time I take a fine fish I think with regret of the thousands of fingerlings slaughtered and sport thus spoiled. If fishermen would try for the heaviest average it would be much more creditable. Every year we find, on returning to our old haunts, the run of fish smaller. Yours truly, WAKEMAN HOLBERTON.

[A capital suggestion! Let every true angler discourage this slaughter by hooting down the puerile pretensions of all persons who vaunt big strings of fingerlings this summer as tests of professional skill. In ordinary brook fishing four fish out of five should be thrown back into the water; and how much prettier is a display of a dozen fair trout than a big bunch of diminutive fry which should put even infantile prowess to blush!—Ed.]

—The following letter, especially the first part of it, will be read with peculiar interest by anglers who have contemplated visiting the Restigouche River in New Brunswick the coming season:

DEE SIDE, METAPEDIA, N. B., May 15, 1874.

EDITOR FOREST AND STREAM:—

As the time is approaching when the lovers of the "gentle art" will be on the move for pastures scaly, and as this river has, through the exertions of the Department of Marine and Fisheries, ably seconded by the different lessees, attained an enviable notoriety for salmon fishing, in order to prevent disappointment to many of your numerous readers and friends, as well as save me the pain of refusing strangers the necessary permission to fish on this river, it will be necessary for any party visiting with this intention to be provided with a written permit from the lessees, viz: Messrs. Fleming & Brydges, Main River; Sir Hugh Allan, Upsalquitch; and George Stephen, Esq., Montreal, Metapedia. As this rule will be strictly adhered to, you will confer a favor by inserting the above and oblige, sir, your obedient JOHN MOWAT,

Fishery Officer, Restigouche Division.

P. S.—Since your visit to us things have undergone a great change. Netting has been greatly circumscribed, the channels have been opened, 36 hours free pass weekly to the fish, spearing totally abolished, netting greatly restricted in fresh water, and lastly a fish breeding establishment in operation. Consequently the tidal fishery last year was nearly double the usual catch, while on the river you could count the salmon in the pools by hundreds, "green hands" making scores of 6 to 8, or even more fish per day, averaging from 18 to 26 lbs.; heaviest fish taken on Main River last year was 36 lbs., but Mr. Stephen had heavier on the Metapedia, and still heavier got on Cascumpedia. J. M.

—We tender thanks for a copy of the constitution of the famous West Island Club, whose members are all able by this time to distinguish a striped bass from a flounder. The membership is limited to thirty persons. All hands are getting their running rigging clear for the speedy advent of the big fish.

—A strange disease prevails among the fish of river and lake at Milwaukee, Wisconsin. Their flesh under the microscope is found to be alive with animalcules. Millions of dead fish are floating upon the surface of the water, and dealers have been forbidden to sell any.

SHAD FISHING.—If "civilization" is not absolutely a "failure" along the Potomac, fly-fishing for shad is, so far as experiments made this season can determine. The fish will not rise to a fly when it is trailed under their noses, and as for game qualities, why, they play, well—they play like a chip! The letter which we append comes from authority so high, and qualifications for investigation and judgment so thorough that the information should be deemed of special value. Unless a lower stage of water by and by, and the jamming together of the shad at the falls in the higher waters of the Potomac during the ripeness of the spawning season shall show entirely different results from those herewith presented, we shall feel compelled to accept the situation and surrender the prerogatives of the angler to the netter and dipper.

WASHINGTON, D. C., May 18, 1874.

EDITOR FOREST AND STREAM:—

As you well know the shad ascends very rapid currents by crossing backwards and forwards in the same manner as horses draw heavy loads up a steep grade. They appear every year to take precisely the same path, and so every few hundred feet upon both sides of the stream (but never opposite each other) you will find a fisherman set a dip net. I placed myself just below one of these dippers at the Little Falls of the Potomac, and allowed my flies to move gently in the slack water from which the shad must pass in order to start diagonally up stream and pass into the net. While many shad were dipped and must have had their noses within a foot or less of the flies sent me by Chalmers, none bit. After two or three hours of futile attempts we then determined to try their mettle, and bargained with the dipper for his fish as fast as he drew them out. With the most careful manipulation we could in no instance slip a hook through the nose and drop into the stream and then get play enough from the shad to click the reel. They seem to have no powers of endurance and but a precious little vitality. Old Mr. Payne, who resides at the falls and has fished there for fifty years says that he has almost every year caught shad with the hook, but that he believes that it was always by the merest accident, and that in no instance did they ever offer the slightest resistance to coming out of the water. We fished last Friday and also Thursday at just the points where Payne had caught them, viz.: in slack water near shore just where

they wait to rest before starting for the next pull across the rapids to the other shore. From this we may infer that our Potomac shad differ in some respects from those Chalmers catches in Connecticut river. In about a week I shall try the Gt. Falls, beyond which we are told shad never pass.

The gentleman who fished with me for shad was the most skilled angler whom I know in this country, so you must not charge failure to want of skill.

A. G. W.

—As to shad in the Connecticut River, we must be content to accept as testimony the tests of past seasons, until we gain new light. Its shad do take a fly. But, possibly shad are not more singular than the black bass, which take the fly in some localities and not in others, so that, after all, the Connecticut may give us a game fish fit to satisfy the angler, while the Potomac remains but a fruitless field. Here is a letter which will be of much service to anglers who propose to satisfy their curiosity by a visit to the Connecticut:—

HARTFORD, May 17, 1874.

EDITOR FOREST AND STREAM:—

The dam at Holyoke, Mass., has been mentioned as a good place for fly-fishing for shad, but I think there is as good a place in the Connecticut at Enfield Falls. There is a dam across the river here and two miles or more of rapids, and last summer there were a number of shad taken with a fly. Parties wishing to try the fishing can obtain boats at Thompsonville or at Warehouse Point, where the bridge crosses the river.

At the time the shad commence to run up the river I have seen hundreds of millers with a grey wing fluttering on the outside and inside of the cars. I have noticed them every season for four years. Some call them shad flies. Perhaps the shad feed on them, but this is merely conjecture on my part. Possibly a fly made in imitation of them might work well for a cast. If you like I will capture one and send you for sample. Hoping some of the fly-fishermen will come up and try the falls,

I remain, yours,

FRANK BOLLES.

In several previous numbers of this paper we have alluded to this grey fly and recommended it for trial. In the latter part of July, they make their appearance on Lake Champlain in countless myriads, and are washed up onshore in windrows two inches deep. They are called shad-tics by the natives, and are taken eagerly by the whitefish, *coregonus albus*, which are also sometimes called "shad." We have known the whitefish, on these occasions, to take a hook.

—Of shad fishing in the Connecticut, the Hartford *Courant* says the present season is the best known in fifteen years. Last year was an especially poor one, the catch being late and the fish small; a shad weighing four and one-half pounds was then considered a big one. This year the average is from four and a half to five pounds, and one weighing six and a quarter pounds has been captured. The supply has until recently come from down the river, but on Thursday sixty-five nice specimens were taken at Cook's, above the railroad bridge, and fish will continue to be caught there and further up until the river falls too low—probably for a week. The main supply, however, must come from Haddam Island, Saybrook and other places below this city. There is an old comparison—"as poor as a June shad"—which in these days proves destitute of truth; for fishermen aver that June shad are fully as fat and nice as any caught earlier. Most of the shad salted are caught in June. The season opened April 17th, one week earlier than last year, and has been so far a profitable one. At one of the two wholesale depots 3,500 were sold in one day. The season will end about the 15th of June. Our readers who have purposed testing their flies for shad in the Connecticut will perceive that it is quite time they were on the ground, and that the period of their endeavors must be limited to four weeks.

—Mr. Norri's article on fly-tying is deferred one week.

Rational Pastimes.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

—The base ball events in the professional arena since our last issue include the first defeats of the new Hartford nine by the champions, both in Boston and at Hartford, the remarkable contest between the Chicago and Athletic nines, in Chicago, and the first appearance of the champions in Brooklyn this season. The signal defeat of the Connecticut "nutmegs" by the "grater" nine of the Hub on the 12th of May was an astonisher to the Clan Douglas. The Hartford did not anticipate a victory, but they did think that they would give the Reds a close contest. But to be whipped by 25 to 3, why it was, as Seguin says in Fra Diavolo, "shocking, positively shocking." The next day at their home field, and with Addy at second base, the Hartford did better, as they kept the champion's score down to a smaller figure than any other club had done, even if they could only get a single run for themselves, the figures of 8 to 1 showing a finely played game.

—On May 13th the Athletic nine arrived in Chicago after a nine hundred mile railroad journey, and the same day they played their first game this season with the Chicago White Stockings, and the contest proved to be the model game of the season thus far, as the appended score shows:—

WHITE STOCKINGS.					ATHLETICS.				
Cuthbert, I. f.	1	0	2	0	McGeary, c.	0	1	0	1
Force, s.	1	1	2	1	McBride p.	0	0	0	0
Malone, c.	1	1	7	3	Anson, 3d b.	0	2	3	3
Meyerle, 3d b.	0	0	4	2	Fisher, 1st b.	0	1	17	0
Treacy, c. f.	0	2	1	0	Sutton, s. s.	0	2	0	0
Devlin, 1st b.	1	1	6	1	Battin, 2d b.	0	0	3	2
Hines, 2d b.	0	0	4	4	Sensendefer, r. f.	0	0	0	0
Glenn, r. f.	0	0	1	0	Gedney, l. f.	0	0	3	0
Zettlein, p.	0	1	0	0	McMullen, c. f.	0	2	1	0
Total	4	6	27	11	Total	0	8	27	6

INNINGS.									
1st	2d	3d	4th	5th	6th	7th	8th	9th	
White Stockings	1	0	0	0	0	0	1	0	1-4
Athletics	0	0	0	0	0	0	0	0	0-0
First base on errors—Athletics, 4; White Stockings, 11.									
Total fielding errors—Athletics, 6; White Stockings, 11.									
Time of game—Two hours, ten minutes.									
Umpire—Al. Reach, of the Athletics.									

Not a run was earned in the game, and but for the errors of Anson and Battin, as above recorded by the Chicago *Post*, the nine innings would have closed with the score of 0 to 0.

—On May 16th the Athletics redeemed themselves by defeating the White Stockings by a score of 7 to 2. Umpire, Mr. Reach. Time, two hours. Earned runs—Athletics, 3; Chicagos, 2. First base hits—Athletic, 11; Chicagos, 9.

—The defeat of the Philadelphia nine by the champion Red Stockings, at Philadelphia on May 18th, leaves the Boston club but one nine to defeat out of their seven club adversaries in the arena. This is an unprecedented success. The championship record is as follows up to May 1. We give the names in the order of games won:—

Club.	Played.	Won.	Lost.
Boston	10	10	0
Athletic	11	6	5
Hartford	6	4	2
Mutual	7	3	4
Atlantic	4	2	2
Philadelphia	6	2	4
Chicago	2	1	1
Baltimore	12	1	11
Total	58	29	29

—The contests in the championship arena since our last issue have been as follows:—

May 11—Hartford vs. Baltimore, at Hartford, 16 to 6.
May 11—Athletic vs. Philadelphia at Philadelphia, 12 to 7.
May 12—Boston vs. Hartford, at Boston, 25 to 3.
May 12—Mutual vs. Baltimore, at Brooklyn, 17 to 5.
May 13—Boston vs. Hartford, at Hartford, 8 to 1.
May 13—Atlantic vs. Baltimore, at Brooklyn, 8 to 2.
May 13—Chicago vs. Athletic, at Chicago, 4 to 0.
May 14—Boston vs. Mutual, at Brooklyn, 20 to 14.
May 15—Boston vs. Atlantic, at Brooklyn, 8 to 2.

—The Columbia College Athletic Association will hold their postponed meeting on the grounds of the St. George's Cricket Club at Hoboken, on Saturday, May 23d. The pastimes will begin at half-past ten, A. M.

—The Philadelphia and Germantown Cricket Clubs played a match at Philadelphia on Saturday, 16th instant, resulting in favor of the former club on the first innings by a score of 62 to 32. This cannot be considered, however, a fair test of their relative playing strength from the fact that the threatening weather on Saturday led many to suppose that the match would not be played, and several of the best players on both sides were deterred from making their appearance.

—The Germantown cricket field presented a lively appearance every fine day last week; three practice wickets being required to accommodate the members of the three clubs who now occupy the ground in common.

—The Young America Cricket Club will make their re-appearance on the tented field, (after a retirement of several years,) at the cricket fête at Philadelphia on the 28th inst., on which occasion they will match strength with their quondam adversaries the Philadelphia Club.

—The veteran St. George cricket club opened play for the forty-sixth season since their organization on May 13th, 1874, and the weather being favorable, and the grounds in fair condition, a good opening game was played, the members mustering quite numerously. Now that they have but two days to practice in, the chances are that more will turn out on the regular days. On this occasion sides were chosen at two P. M., and a dozen young Bachelors took the field against a field team of Benedicts, and though the former made a good score of eighty for eleven wickets down, the married men overtopped that score at the fall of their sixth wicket, and when play terminated they had obtained 109 for seven wickets.

—In Brooklyn, on May 14th, about 3,000 people were gathered inside the Union grounds, and half as many outside, to see the Boston nine play their first game with the Mutual nine, a close contest and a fine display of ball-playing being fully anticipated, but the score showed how poorly the game was played, the figures being 20 to 14. The next day the Bostons played their first game with the Athletics—a close contest and an exciting match. The Athletics, though having two men disabled, played a very fine fielding game, but they were obliged to succumb to the superior skill of the champions. Atlantic, 2; Boston, 8.

—Mr. Weston has failed to accomplish the greatest of all feats, that is to walk 500 miles in 144 hours, of one week. However, he did walk 430 miles in the specified time. Did not Mr. Weston attempt too much in trying to perform two extraordinary feats in one week? In our opinion, if he had omitted the first, of walking 115 miles in twenty-four hours, he would, in all probability, have succeeded in completing the 500-mile walk, or what is thought to have been the display of the greatest physical endurance known to man. The first day Mr. Weston only rested one hour, one minute and one second, and achieved the feat of walking 115 miles in twenty-four hours, but the next day it seemed to be necessary for him to rest ten hours, fifty minutes and five seconds, in order in some measure to recuperate from the fearful fatigue of the day before. Supposing he had divided his rest, &c., more evenly all through, and not started off at a racing pace to finish an unparalleled feat, there is no doubt that he would have accomplished it; in fact, in the latter part of the walk, Mr. Weston was absolutely struggling against his own exhaustion.

Mr. Weston's dress on the occasion was scarcely orthodox for a pedestrian who had undertaken to endure more than humanity could bear. Velvet is very pretty to look at, and delight an audience, but it is certainly not so porous, nor does it give, as it were, to the muscles and joints like flannel. Were not the boots too heavy and the leggings too tight round the calves of his legs? A pair of solid mocassins is the boot to walk all day and night in, broad sole, short large heel, and the feet ought to be encased in a pair of lamb's wool socks, not woolen; the sleeves of his shirt were too wide, which impeded his progress, and should have fitted closer from the elbow downwards; the belt was also too narrow. Mr. Weston undoubtedly knows the best what dress and boots to walk in, but at the same time we would suggest a white flannel suit, not Canton flannel, to be made like the velvet suit he walked in, with one exception, that the vest should be made with arms to it, and the coat without arms, so that he could take off the coat at pleasure, still his arms would be covered, and give them all the play necessary. Castile soap and palm oil is the proper liniment to use to the feet, to the contrary notwithstanding. Advice is undoubtedly very cheap, now that he has failed to accomplish the task he set himself. If Mr. Weston ever attempts a similar feat, we trust he will confine himself to one marvellous exhibition of his walking powers, and not attempt to do two unheard of feats at the same time. We

have every confidence in Mr. Weston that he can walk 500 miles in 144 hours, if his friends and himself will act with discretion and judgment.

—In a game of fifteen ball pool played last Saturday night at the Jeffersonian Billiard Parlors, 17 Chatham street, FOREST AND STREAM building, the Superintendent of the rooms pocketed the whole fifteen balls in thirteen shots, a feat so unusual as to be worthy of record.

New Publications.

THE FOUR CIVILIZATIONS OF THE WORLD. Lippincott.

Lippincott & Co. have just published a work under this title, written by the Chevalier Wikoff, whose love episodes while travelling in Europe a few years ago were the topic of the times. This brief historical retrospect, written at this late day, has many commendable and interesting traits to recommend it to the perusal of candid readers. He notices the progress of civilization from its early dawn in Asia' its progress throughout Europe, and finally in the United States. It is a far better book than we could have imagined would have emanated from the brain of the mercurial "Chevalier," and we are pleased, as a reviewer, to be able to say that we think this volume will command the earnest attention of the highly educated classes. We understand that this is a prefatory or pioneer volume to one yet unfinished, in which he will talk about himself and his own times, or 1890 to 1870.

FRANK FORESTER'S QUORNDON HOUNDS. By H. W. Herbert. N. Y. T. B. Peterson & Bro.

This is an interesting little work on English fox hunting and other sports, and is treated in the usual spicy, humorous manner of our racy author. In Col. Fairfax, a Virginian and a true gentleman, whose ready adaptation and true knowledge of the chase, the frequenters of not the Melton Mowbray, as it was of old, were not a little astonished. The good old Melton Mowbray of the days of George IV are no more, but yet there remain to-day many good club houses, the resort of choice spirits who are an honor to English society. There were also equivocal characters; also snobs in those times, who of course could not tolerate anything or anybody who was not decidedly English. A pleasant, racy story of the days of fox hunting on English grounds, giving a glowing, animated picture of this exhilarating sport.

DEER STALKERS. By Frank Forester. Philadelphia. T. B. Peterson & Co.

This is a little lively sketch, something after the style of "Quorndon Hounds," but has a sort of tragic ending. The story is well told, and our sporting friends will not unfrequently recollect many of their back-woods friends, guides, pioneers in the chase after the deer, that forcibly call to mind many of the life-drawn characters of this racy sketch, particularly "Dolph," "Archer" and "Pierson."

EARNST WEMER. A Novel of Good Luck; or No. 39 of Osgood & Co.'s Library of Novels. Boston. J. R. Osgood & Co.

This is a very fair translation from the German by F. A. Shaw. The characters, as a whole, are complete in delineation, of much dramatic interest, and exhibit a remarkable power of construction. It could be dramatized, we think, and made quite an effective, lively drama. "The strike of the German miners" will be found an episode of itself not soon forgotten.

ANNIE MASON; or, The Temple of Shells. N. Y. A. D. F. Randolph & Co.

This story is one of greater interest than we usually find in a simple narration. It is an illustration of the power of principle, and is a very pleasant illustration of the virtues of patience, charity, courage and faith. It is destined, we believe, to have an extensive circulation, for it is a very valuable as well as attractive book. We find within its pages nothing to censure, much to commend.

The same publishers have placed before us a very pleasant work, entitled "Signal Lights," which any one can read with improvement. Making no pretensions to religious teaching, it is a bright lesson of the rewards of living a true life and upright manhood. There is a charming simplicity, as well as natural refinement about this little work, that makes it a fitting and proper volume to place upon the shelves of our Sunday School libraries. It is a far more desirable volume than many we find there whose title pages proclaim them to be religious works.

STORIES ABOUT ANIMALS. By Thomas Jackson, M. A. London and N. Y. Cassel, Petter & Galpin.

This is a fine quarto edition of 254 pages and upwards of 250 illustrations of a very high order of English wood cuts. This work, although written by the good Rector of Newington for the express use of his "eleven grandchildren," to whom he dedicates it, will afford both amusement and instruction to everybody else's grandchildren, if they can obtain it. This large collection of stories about animals is told in a plain, simple, old English style, without a single technicality throughout the book. There is indeed something far more wonderful and romantic in this book about curious animals, than the most racy fiction of the times. It is time the minds of our young boys and girls were filled with a more wholesome kind of stories than "Jack and the Bean Stalk" or the "Old Ogre," and we are pleased to welcome as one of the reformers of youthful literature the author of these stories of fact, and not of fancy.

NINETY-THREE. Victor Hugo's new book. The version by Frank Lee Benedict. 1 vol. pp. 356. N. Y. Harper & Bros.

This is a story of the Reign of Terror, or the days called the times of the French Revolution, in which the trials of the Holy Inquisition added such deep and significant as well as terrible interest. We have not read such an exciting work for a long period of time. When we note the stirring events of which this work treats and the abundant materials from which the great novelist wrought out this wonderful romance, we feel that a failure to make one of the greatest romances of the day could not fall to the lot of Victor Hugo. Of this work it will truly be said it will have a hundred thousand readers. We have only to say within its fascinating pages a full account of those terrific days and startling incidents will pass truly before the reader, and if he feels that, critically speaking, there may be an exaggeration of facts in a strictly historical point of view, we can readily pardon them, as the best of authors sometimes do slightly exaggerate. This work is brought out in Harper's best style.

The *Aquatic Monthly* continues to do good work and presents much valuable matter with each issue to its readers. With the May number, now before us, it completes its second year, and entering on its third year we can only hope that it will be as successful in the future as it has been in the past. The *Aquatic Monthly* is devoted exclusively to promoting our yachting and rowing pastimes, and has supplied a want long felt in giving a medium for controversies on mooted points relative to the design, construction, rig and handling of our yachts. Among the various letters of its able corps of editors and contributors we have frequently noticed the articles of a gentleman writing under the nom de plume of "Big Topmast," and we can thoroughly endorse and recommend them. He is working in a good cause, as is the *Aquatic* in giving spread to his views on the scientific designing of what may be termed a new class of yachts with us. The magazine is edited by Mr. Charles A. Peverly, long known in aquatic circles, is published by Mr. August Brentano of 33 Union Square, and is issued in a most attractive form.

—Thousands of sportsmen use Kimball & Co.'s tobacco because it is the best.

—Ask your dealer for Kimball & Co.'s tobacco, or send to them for a supply.

—Grand Medal of Merit, Vienna, 1873, awarded W. S. Kimball & Co., Rochester, N. Y., for their tobacco.

Sportsmen's Goods.

SCHUYLER, HARTLEY & GRAHAM,
 19 Maiden Lane, 20 & 22 John street, N. Y.
BREECH LOADING GUNS
 A SPECIALTY.

We would call the attention of the public to our large assortment of

Breech-Loading Shot Guns,
 Manufactured by the following celebrated makers: Messrs. W. & C. SCOTT & SONS (winners at the International Gun Trial of 1873); P. WEBLEY & SON, W. W. GREENER, WESTLEY RICHARDS, J. HOL-
 LIS & SONS, and other makers.

A full line of fine
PISTOLS AND RIFLES CONSTANTLY ON HAND.
DIXON & HAWKLEY'S SHOOTING TACKLE.
 To insure good shooting from Breech-loading Guns, we would recommend the use of the

STURTEVANT BRASS SHOT SHELLS,
 manufactured by the Union Metallic Cartridge Co., Bridgeport, Conn. These shells are the cheapest and best in the market, can be easily re-capped with ordinary caps, without the use of the implements necessary in priming all other styles of shells.
BUSSEY'S PATENT GYRO PIGEON AND TRAP,
 WITH CASE, AND 100 BIRDS.

Black's Patent Cartridge Vest.

This Vest affords

TOBACCO WORKS,
 Rochester, New York.

Smoke Wm. S. Kimball & Co.'s Vanity Fair.
 Use Wm. S. Kimball & Co.'s Peerless Chewing Tobacco
 Use Wm. S. Kimball & Co.'s Plain Chewing Tobacco.
 Two Prize Medals awarded Kimball & Co.'s Tobacco.
"VANITY FAIR" IS THE PERFECTION OF
SMOKING TOBACCO.
"VANITY FAIR" IS UNLIKE ANY OTHER TO-
BACCO.
"VANITY FAIR" DOES NOT BITE THE
TONGUE.
"VANITY FAIR" IS PARTICULARLY ADAPT-
ED TO MEERSCHAUM SMOKING.
"VANITY FAIR" IS PARTICULARLY ADAPT-
ED TO CIGARETTE SMOKING.
"VANITY FAIR" IS KING OF ALL SMOKING.
"VANITY FAIR" HAS THE RIGHT SORT OF
STRONGNESS.
"VANITY FAIR" IS NOT TOO STRONG, BUT
IS JUST RIGHT.

Kimball & Co.'s Peerless is pronounced by connois-
 sers to be the best sweet chewing tobacco in America.
 Kimball & Co.'s Plain Chewing is neither sweetened
 or flavored, but is plain and pure. Clubs supplied
 with Kimball & Co.'s Tobacco.

Kimball & Co.'s Tobacco is always uniform and reli-
 able.

Kimball & Co.'s Tobacco is aid in the forest and
 comfort on the stream.

Wm. S. Kimball & Co.'s Tobacco is sold generally
 throughout the United States. The following are a
 few dealers of whom it can be procured: Jas. H.
 Page, 31 Broad street, Boston; Jos. Yeazie, 11 Frank-
 lin Square, Boston; E. E. Mancos, cor. Broadway
 and Maiden Lane, N. Y.; Chapin & Gore, 75 Monroe
 street, Chicago; West & Fritsch, 222 Douglas street,
 Omaha, Neb.; Luchs & Bro., 525 7th street, Washing-
 ton; Thos. P. Cantwell, Brainerd, Minn.; Lewis, Bull
 & Co., Clancey, Montana; also the retail dealers at
 Buffalo, Cleveland, Toledo and Albany; Mohl &
 Schneider, Grand Rapids, Mich.; Perry & Slawson,
 Columbia, S. C.; Max Powell, Quincy, Ill.

For a first-class Dress or
Business HAT, go direct to the manufacturer,
ESPENSCHIED, 118 Nassau street.

REMINGTON'S CHALLENGE
Long Range, Breech Loading,
TARGET RIFLE.

Orthoptic, Vernier Scale Sights
 Graduated up to 1,500 Yards.

Weight, 10 lbs.
 Length of barrel, 34 inches.
 Calibre, .44-100 in.

Pistol-grip Stock, Fine Walnut,
 Oil Finished. Checked Grip, Case-
 hardened mounting.

The following discs for front sights.

Open bead Bar and Sift. Bar & Open Bead.

The above rifle was the winner of all the prizes for accurate shooting at Creedmoor at the last spring meet-
 ing, 102 out of 123 at the fall meeting, "Turf, Field and Farm" Badge, 3 out of 4 times. Amateur Rifle Club
 Badge (final). Diamond Badge, first and only time. For authentic record of above see N. R. A. First Annual
 Report, just out. At the match Saturday, 16th inst., 7 Remington and 7 other rifles were used, resulting in a
 score of 302 for Remington and 287 for the others, giving Remington's 15 gain, or two points to each man. For
 full particulars of these rifles address

E. REMINGTON & SONS, 281 and 283 Broadway, N. Y.,
OR ARMORY, ILION, N. Y.

This rifle was submitted in competition with over
 one hundred different systems, American and Euro-
 pean, to the Board of United States Officers, appointed
 by Act of Congress, 6th June, 1872, for the pur-
 pose of selecting the best arm for the service, and of
 which Brig. Gen. A. H. Terry was President. It suc-
 cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for
 the military service by all nations is only a question
 of time; that whenever an arm shall be devised which
 shall be as effective as a single breech-loader, as the
 best of the existing breech-loading arms, and shall at
 the same time possess a safe and easily manipulated
 magazine, every consideration of public policy will re-
 quire its adoption.

Resolved, further, That the experiments before the
 Board with the Ward-Burton Magazine System have
 so impressed the Board with the merits of this gun,
 that they consider it as more nearly fulfilling the con-
 ditions above specified than any other tried by them
 or of which they have any knowledge, and it does
 recommend that a number of magazine muskets be
 made on the plan for further trial in the field." (See
 Ordnance Report.)

We are now receiving orders for these guns, and due
 notice will be given in this paper when they are ready
 for delivery.

The following is our scale of prices: Special Maga-
 zine for large game, carrying from 3 to 8 cartridges,
 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
 lbs. weight, from \$60 and upwards, according to finish.
 Special Long-range Magazine Rifle for Creedmoor
 shooting, 90 grs. of powder, 480 grs. of lead, carrying
 3 to 8 cartridges, weighing 10 lbs., from \$100 and up-
 ward. Magazine guns for general use, carrying 3 to
 9 cartridges, 60 grs. powder, 350 grs. lead from \$40
 and upward. Single Breech-Loader, Creedmoor
 shooting, for long range, 90 grs. powder, 480 grs. lead,
 from \$60 and upward. Single Breech-Loader for
 general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
 from \$30 and upward. The calibre of all our rifles,
 unless otherwise ordered, will be .45-100 in.

All communications should be addressed to

NEW YORK
STATE ASSOCIATION

FOR THE PRESERVATION OF

GAME AND FISH.
THE ANNUAL CONVENTION

of this Association will be held at

Oswego, N. Y.,

On or about the

FIRST WEEK IN JUNE, 1874,

Under the auspices of the

Leather Stocking Club

OF OSWEGO, N. Y.

It is proposed and expected that this meeting will
 eclipse all previous ones held in this State, both as
 regard to value of prizes and number of clubs partici-
 pating.

A BENCH SHOW OF DOGS

Will be held at the same time, under the direction of
 the State Association.

One day during the meeting will be devoted to

FLY CASTING & RIFLE SHOOTING.

The remainder of the week to shooting from the trap.
 Sufficient wild pigeons have been secured to insure
 a fair trial to every person who may participate.

The magnificent hotel erected in Oswego by Mr.
 Doolittle, capable of accommodating 500 guests, will
 be opened June 1, 1874. The additional accommoda-
 tion afforded by this hotel enables the Leather Stock-
 ing Club to assure all visitors that ample accommoda-
 tion for all can be procured at any time during the
 meeting.

Circulars and other information concerning the
 meeting will be cheerfully furnished on application to

J. F. MILLER,
 Secretary Leather Stocking Club, Oswego, N. Y.
 A. C. MATTOON,
 President N. Y. S. Sportsmen's Ass'n, Oswego, N. Y.
 J. B. KLOCK,

For Forest and Stream.
MOTHER BROWN.

DECORATION DAY, 1874.

EVERYONE called her "Mother" Brown
In that little hamlet, half-way down
In the blood and terror of Borderland—
"Rebel" and "Yank" on either hand.

The little village had suffered through
All the struggle of Gray and Blue,
Suffered, and lived as some shallop trim
O'er a proud Armada's grave might swim.

The storm is past. But the heaving waves
Speak in the wind o'er the grassy graves
To many a weary heart in the little town;
Two have voices for Mother Brown.

Two brave boys were the widow's mite
To th' accursed fratricidal fight;
One with the wayward South went forth,
One stood fast with the loyal North.

Both to their duty in simple style,
With the unknown Great of the rank and file;
Doing and dying to some account,
As ciphers that swell a grand amount.

And then they came home to the mother's side,
And to the mother heart thrice crucified.
Side by side in the churchyard gray,
They are waiting the angel's reveillee.

Never a monument, never a stone,
Naught in the wild flowers gently strewn,
Naught but the love in a mother's heart
To tell the two low mounds apart.

For the flowers spring up in the rank, low land,
Trained by nature's impartial hand,
And the wreaths and the tears fall from above,
Blessed by a mother's equal love.

Only the bigot's blinded view
Sees not glory in Gray or Blue.
Only the stay-at-home heroes say
Which was the braver—Blue or Gray? J. J. ROCHE.
Boston, Mass., May 22, 1874.

For Forest and Stream.
Trout Regions of North Carolina.

NOW, when "stern winter no longer rules the skies," and the bleak March blasts have blown themselves out, the denizens of our closely packed cities and towns begin to long for shady forests, limpid streams, and the delicious abandon of a lazy summer vacation. Especially are the disciples of the rod casting around to find, if possible, some new locality where they can practice their gentle art. The places to which they have heretofore resorted have become so familiar to the public that they are overrun by civilization (?) in its worst forms. Pot hunters and photographers, parasols and pinafores, crinoline and croquet, steamboats and shoddy, hotels and hostlers, railroads and reporters now swarm over spots consecrated and long endeared to the heart of many a gallant sportsman.

In the language of Truthful James, well may he exclaim, "Shall these things be?" I answer No! Let these parvenues hold on to their usurpations; we will seek new fields and streams, and erect our temples in some remote spot where for awhile, at least, we shall have no companion but Nature.

There is in North Carolina a large territory which I verily believe to be unsurpassed on the continent for advantages as a quiet summer resort. There is not a railroad or navigable stream in it. It has long been known and appreciated by the dwellers on the South Atlantic and Gulf coasts, and prior to the "late unpleasantness" was a favorite retreat for them from the fierce heats of their more southern homes, but since the war, as a general thing, their crippled fortunes have not permitted their return. A few have found it impossible to resist the attractions, and among them is that true gentleman and prince of sportsmen, Gen. Wade Hampton.

Upon an examination of the map it will be observed that

in Virginia the Great Chain of the Alleghany Mountains divides, one range preserving the original name and south-westerly direction, while the other diverges toward the south until it crosses the State of North Carolina, where it turns sharply towards the west, running almost parallel with the Alleghanies until it gradually sinks into the plains of northern Alabama. This last range is called the Blue Ridge, and divides North Carolina from South Carolina and Georgia. The first is the boundary between North Carolina and Tennessee. That portion of the State lying west and north of the Blue Ridge, and south of the Alleghanies, is known as western North Carolina. It is about one hundred and seventy-five miles in length, with an average breadth of seventy-five miles. It embraces sixteen counties, about seven thousand square miles, and has a population of over eighty thousand. In the early history of the State this entire area constituted but one county—Buncombe—and the often quoted and misspelt expression, "speaking for Buncombe," originated from the member for this district while making an extraordinarily dull speech in the House of Representatives many years ago.

This section has frequently been described as a plateau, but it is in fact a very mountainous region, being divided into a number of narrow but exceedingly fertile and beautiful valleys by transverse ranges connecting the Alleghanies and Blue Ridge, suggesting a resemblance to the celebrated ligament which bound together the Siamese twins. The Black Mountain, in Buncombe and Yancey counties, and the Balsam, in Heywood and Jackson counties, are the most noted of these transversal ranges. Indeed, Professor Guyot, of Cambridge, who has given great attention to this region, and has made careful barometrical measurement of several of the highest summits, denominates it as the culminating point of the great Appalachian Chain. On the Black Mountain are several peaks—Mt. Mitchell, Clingman's Peak, and a dozen others, higher than Mt. Washington, and on the Balsam is Mt. Pisgah, Plott's Balsam, and five or six more, all of which tower more than six thousand feet above the sea. No description can convey a clear idea of the remarkable parallelism of the ridges and valleys which characterize the topography of this region, or the grand and beautiful features of its scenery. To comprehend all its grandeur, and appreciate all its beauty, one must climb its mountains and wander among its valleys.

Probably the greatest charm is the magnificent climate. From May till November is one continued season of health, beauty, and enjoyment. The nights are deliciously cool, allowing sound and refreshing slumber, and as the morning advances the sun pours down hot rays, which would be oppressive but for the breezes from the high tops and shaded glens of the mountains. I believe a long series of observations show the maximum temperature to be about eighty-five degrees, the mean summer temperature being about seventy-two degrees. This extraordinary dryness of the atmosphere has a fine, exhilarating effect on the system, especially for invalids, and renders the country free from annoying insects. Mosquitoes and black flies are unknown.

The valleys have an average elevation of two thousand feet, and are generally well studded with farms and hamlets, but the mountains are, and for centuries to come will remain, wildernesses. In them game is abundant, but in the settlements it is growing scarce, owing to the discreditable indifference of the people and law makers on the subject of game laws. Now, without stint or limit, any one may shoot, trap, kill, slaughter, butcher, and destroy till his savage instinct is satiated. Several individual efforts have been made within the last two years to secure some legislation for the protection of game, but so far without effect. Still we do not despair, and propose to organize clubs and endeavor thus to discuss and agitate the question till our object is accomplished.

The valleys have each their principal stream, taking its rise in the northern slope of the Blue Ridge, and flowing in a northerly course through the Alleghanies into the Tennessee Valley. It is a remarkable fact that while the Blue

Ridge has a lower elevation than its sister chain, the streams all head in it, and run through the others, cutting deep chasms and gorges. It frequently happens that one may in the space of five minutes dip a cup of sparkling water from two springs, one sending its tribute down the southern slope to the Atlantic, the other in the opposite direction to the Gulf, to meet after months of wandering, having traversed every variety of soil and climate beneath a tropical sun. All of these streams are pretty well supplied with fish. In some they are very abundant, the pike and black bass of the south, both very game, being the most desirable. But it is the head waters and tributaries of these rivers where the joy of the angler's heart—the speckled trout—is to be found in untold numbers. They are not large, seldom exceeding eighteen inches in length, and averaging not more than nine; but their great number compensates for their size. Indeed, it is a question whether it is not better sport to whip one of these mountain streams, with the excitement continually at the boiling point, than casting lazily from a boat or clear shore with a strike once every three hours. It is no easy work to fish one of these streams. They come rushing down the mountain gorges, leaping over cascades, boiling, foaming, and roaring beneath the sombre balsam, hemlock, and rhododendron, often for miles without a ray of sunshine being able to penetrate the dense foliage. You must wade, and the water is decidedly cold, the current rapid and strong, and the rocks—well, *slick* don't express it. He who essays a day's sport here must be prepared for anything in the way of a ducking. He will not go far before his heels fly up and his scalp is introduced to the acquaintance of the rocks at the bottom. I would be delighted to see some of the fancy chaps tackle the "North Fork" or "Callaloocha," with his patent boots, hat, and all the paraphernalia with which they usually travel. I opine he would be seized with a desire to go home before dinner. Last summer a dandified *attaché* of a Government office in Washington came down, and I watched his first efforts with great curiosity. In less than ten minutes he "had gone and done it." There was not a dry thread or hair about him, and he was lying gasping on the bank feebly articulating for "speerits." He however had the true grit, and went at it again, and before the trip was over he had several opportunities to retort the joke. To the true sportsmen all these things add to the charms of the sport. To me the highest felicity is the return at nightfall to the camp, wet, cold, hungry, and tired, to see the spoils of the day nicely frizzling and browning on the fire, to change the wet for warm, dry clothing, a healthy "smile," a dozen trout for my supper, the soothing pipe while recounting the incidents of the day, the sound, refreshing sleep to the lullaby of the roaring stream, while the bright stars keep watch overhead. I wish I could find words to convey to your readers some idea of the splendid days I have had in these mountains. But all descriptions of fishing expeditions read alike, and I can only say to you and your patrons, come and see and feel for yourself.

Should any one be disposed to visit the country of which I have given but an imperfect idea, there are several routes open. Asheville is well situated for a starting point, being geographically, in the centre of the region. From New York or any of the New England or eastern States, the best route is *via* Richmond, Danville, Salisbury to Old Fort, by rail, thence across the ridge twenty-four miles by stage, a daily line connecting with railroad. From north-west *via* Louisville, Nashville, Knoxville to Wolf Creek, thence by stage forty-four miles—a daily line. From the south either one of the routes mentioned will be found convenient.

In conclusion, let me say that there does not exist on the face of the earth a people more honest and hospitable than in the mountains of western North Carolina. They do not know how to cheat or extort, but in their humble and simple homes they extend a welcome and entertain the stranger with that whole hearted kindness not to be found in the conventional circles of more refined life.

Asheville, N. C., April 25th, 1874.

"BUNCOMBE."

For Forest and Stream.

SPORTING IN NORTHERN LOUISIANA.

"I RECKON you'll kill all the deer in the swamp," banters the old gentleman as he deals out my buckshot. "I won't brag 'till I get out of the woods," is my laughing reply, as I throw my leg across "Billy" and set him going for the house. I am spending the winter in Northern Louisiana on my father-in-law's plantation, and this conversation is held with that worthy personage himself at the plantation store. I am going after deer in the morning and he is rather sceptical as to my shooting abilities. Shadowy deer followed by shadowy hounds gallop through my dreams all night long until I wake with a start and find it three o'clock. Slipping out of bed I wake up "Dennis," who is sleeping on the floor at my door, and after much grunting and rubbing his eyes, he goes out to get "Billy" ready. In a few minutes I hear the horse under my window, and going quietly out I am quickly on his back, out of the gate and riding along towards "Hope Estate," where I am to breakfast before we put in the hounds. "Billy" is not long getting over those two miles. The dogs come trooping out to meet me and their music brings out Charley Bryant, who greets me with "Hello! Val., got an early start, didn't you? Breakfast is all ready, come in." While we are eating, Charley's horse is brought around, and after looking carefully to our guns and other traps, we start for the woods. Our route lies across an old meadow of several hundred acres and we stir up numerous coveys of quail, which go whirring off into the bushes. At last we strike into a dry bayou and will ride along its bed into the woods where Charley puts me on a stand, then leaves me with a caution to "keep still, and if you hear the dogs keep your eye peeled for that break in the cane across the bayou, and mind you let the deer come as far as it will before you shoot." "All right, Charles, if one comes my way I'll try to take him in," I answer, and mentally resolve not to have the buck fever, for this is my first deer hunt and I know Charley don't expect much from me. I tie my horse back in the cane and build a smoke to keep flies away from him; then going carefully back to the top of the bank, take my stand by a large oak tree, from which the view up and down the bayou and across to the opposite side is clear. There I sit for half an hour listening intently for the hounds, but hearing nothing except the "tu-whoo" of an owl above my head and the noise of a rabbit racing through the brush. I walk back and replenish the "smoke" for my horse, and just as I return to my stand I hear a sound that starts the blood in my veins and crouches me down against the tree with my eyes fixed upon the opening in the cane. First, one dog gives tongue, hesitates as if in doubt, and then takes it up, followed by one after another, until I know the whole pack has the scent and is coming my way. They are at least a mile away, I think, and I have plenty of time, but almost before I can cock my gun a big doe comes out of the cane beyond and trots down the sloping bank directly towards me. She is in no hurry, and as she reaches the bottom she turns her head to listen to the hounds behind her and gives me a fair broadside shot. Gone now are all thoughts of buck fever, and as my gun comes to my shoulder I measure the distance with my eye. Fully a hundred yards, but delays are dangerous, and the old gun never failed me yet. At the shot she jumps straight into air writhing like a serpent and comes down on her back in the soft dirt, where, after a few convulsive struggles, she staggers out and is dead. By this time the dogs are very near, and in a moment they come tearing through the cane in full cry and bounce on the deer almost before they know it. Then ensues a struggle between them and me. The smell of the blood makes them wild and I do not realize the danger I am in until Charley, who has heard the shot, comes up and drives them off, saying, "It's a wonder they didn't take a piece out of you."

"Well, Charles, how's this for a buck fever greenhorn?" His answer is the flask, which he holds towards me, and we drink a health to all good sportsmen.

In butchering her we find that she got one shot behind the shoulder and another through the neck, and Charley tells me that the last is the one that did the business, as without it she might have run a long time. I am too well satisfied to dispute with him and we ride home, I finding myself rising rapidly in Charley's esteem, as I know by his comments upon the long shot I have made. I won't attempt to describe my feelings as I ride into the yard with my game across my horse. Suffice it that a sight of the skin convinced the old gentleman that I, and not Bryant, shot the deer, and he never attempted to bother me again about shooting.

Louisiana, especially in the middle and northern tier of counties, is very heavily timbered and thickly intersected by bayous, many of them navigable and all affected in volume by the rise and fall of the Mississippi, into which all their waters eventually empty. The cutting of the levees by Grant at Lake Providence near Vicksburg, overflows all the low lands of that section every spring, the water usually rising in March and falling in April. These annual overflows drive the deer from their swamp coverts to the uplands which are not subject to overflow, and at that time the shooting is better than at any other, as, the deer being confined in a limited area, there is no trouble in starting one, and once started, if one knows the lay of the land, and has a good horse, he need seldom fail of a shot. To those who have never tried it, "heading off a deer," seems rather risky work, as the hunter must go through whatever comes in his way, be it canebrake, briar patch, or bayou. But with a good sure-footed horse that is used to the work, one will generally go through unharmed, barring scratched hands and face, torn pants, etc., and what sportsman ever thinks of such bagatelles when the dogs are running across his quarter, and he astride a good horse, trying to make the spot where "the old wood road crosses the bayou" before the deer gets there! I can imagine no sport more exciting than this, and I long for the time when I shall be at it again. Bear hunting can also be had, but this necessitates a ride into the deepest recesses of the swamps and a sojourn among bear-hunters, hog stealers and refugees from justice, for whose society I never had any desire. Into these bayous and swamps in the fall the mallards come from their northern summer haunts in countless numbers.

Quail (called partridges there) and woodcock, are also very abundant. The latter is hunted in a way that can hardly be called sport and I never joined in it. At night the woodcock come out of the woods upon the cotton fields to feed. The hunter makes a couple of pitch-pine torches, and with negroes to carry them, starts in. The birds attracted by the torches which throw a bright light all around

the hunter, do not attempt to fly and are shot sitting at short range, the hunter using pistol charges. For abundance and variety of game and whole-souled, hospitable people, Louisiana is not to be excelled.

A RIFLE EXPERIENCE.

A PROPOS of Creedmoor and target shooting generally, let me relate a little incident which occurred here not long ago. The parties concerned were four gentlemen. A prominent physician—a crack shot, by the way—a young Front street merchant, and two lesser lights, one of whom we will call Bangs. Bangs is a genius and a connoisseur in the fine arts. He loves to hover around old book stores and picture shops, lugging off rare old tomes from the one and time-stained canvas from the other, and it transpired that during one of his peregrinations he purchased at auction, a Springfield rifle guaranteed in good order, prime condition and so forth, such as was used in the late "unpleasantness." Upon showing the trophy to his friends it was decided that they would test its merits in the suburbs of the city on the next opportunity, although well aware that it was hardly *en regle*, and that they would not be practicing with a Sharpe or Remington.

The auspicious day arrived; a few pounds of slugs and other ammunition were procured; a suitable field was found—the property of some unoffending granger—a piece of paper was pinned to a tree at a distance of about eighty or one hundred yards, and operations commenced. After a little preliminary conversation it was elected that Bangs should fire the first shot, the others not being particularly anxious to have a practical illustration on the subject of recoil. He shouldered it bravely and blazed away; one of the party skipped over to the tree, examined it as thoroughly as any naturalist would have done under different circumstances, glanced up into its branches to see if any limbs were missing and pantomimed back "No!" to the others. Another tried it—same result. Some one suggested that perhaps it would be well to make allowance for deflection of the ball on account of wind. Third shot—tree still untouched.

At this point attention was drawn towards an old man seen to issue from a farm house, situated about a quarter of a mile distant, and about thirty degrees to the left of the target. Misgivings filled the minds of the party as they beheld him approaching them. Some one muttered "constable—trespassing," and other pleasant subjects, but it was not that, oh, no! he merely wanted to say that "those slugs was whistlin' all round and over his house, and wouldn't they please move a leetle, as no knowin' what might happen!" Of course they would, and did, at the same time somewhat puzzled that their shots should describe such curious curves. Another tree was found. More essays. Some one grazed it, but it was afterwards believed to have been done by accident.

At this juncture Bangs was startled by the Doctor's declaring in exasperated tones that "the barrel was crooked! Yes!" he exclaimed—squinting down the side from the muzzle—"it is crooked, being bent on some thing!" "Thought something was wrong," said one. "So did I," chimed in another. "Nonsense," said Bangs, "optical illusion. Those bands that hold it to the stock make it look so." But the Doctor was excited and stripping the stock from the barrel they discovered that it had been bent, how they knew not, unless used as a bludgeon by one of Uncle Sam's boys. But you should have heard the laugh that went up. You should have seen Bangs' face. One suggested that he bury it in a furrow; another that he deposit it in a fence corner. While walking back he remarked, gazing abstractedly at the sky:—"Remarkable thing, such deflection caused by wind!"

And now he wants to dispose of a first-class Springfield rifle—cheap.

GUNS, AMMUNITION, &C.

MANY sportsmen who are not owners of breech-loaders are disposed to substitute them for the muzzle loaders. To such, and all others, I would say keep your old "antiquated" Americans, as a class are tenacious of their opinions, but when they do give them up, it is no half way work; they go just as far the other way.

Breech and muzzle-loaders each have advantages not possessed by the other. It is possible to use and do good work with either. I own the best of both kinds, as far as wood and iron go, and am satisfied with both, and wish to part with neither. My judgment may err in regard to their merits, but not from prejudice; I have but a sportsman's interest in either.

The muzzle-loader is certainly the type, the breech-loader an offshoot; both are dependent on the same principles for good shooting, viz., the proper chambering of the shot and lack of windage. In this respect the muzzle-loader has the advantage from its solid breech and never varying barrel in which the shot are chambered; also the conical breech is better adapted to the slow burning of the powder, which lessens recoil, but this may be regulated in the breech-loader by using coarse powder.

The chambering of shot in the breech-loader is dependent entirely on the inside measurement of the shells, which in paper ones varies in manufacture, from the difference in the wads used, and the amount of pressure in load. Irregular chambering of shot causes irregularity in shooting.

The brass shells are not adapted to guns made to use the paper ones, being about two sizes larger in the bore. The shot are crowded and misformed in their passage into the barrel which is still less than the bore of the paper shell.

Guns made to use the metal shells are not adapted to use the paper shell; there is too much windage. It would be much more reasonable to adapt both kinds of shells to the guns than to try to adapt the guns to the shells. The danger attended in the use of metal shell should be looked at. The accidental discharge of one about the person would be positively dangerous, whereas a paper shell is comparatively harmless.

For upland shooting, paper shells of third quality will be found more desirable, and in the long run more economical than the metal ones, but for all kinds of shooting from boats or blinds, properly constructed metal shells would certainly be superior.

In wild fowl shooting the sport is largely dependent on keeping the person of the shooter out of sight, and rapidity

in loading, as the flight is often of short duration. Here another valuable feature in the breech-loader comes into play; the ease and rapidity with which the load may be removed and changed to suit the size of game that may present itself. (In upland shooting one needs but one size of shot, nor wants the bother of carrying extra ammunition), this shows the breech-loader's superiority above its rival; but I am sorry to say, in my opinion, here that superiority ends; with the exception of the charging the gun, it is attended with less risk.

In field shooting the weight of the gun is a very important item, it should be as light as is consistent with strength. In this respect I find after careful gauging, measuring and weight, the muzzle-loader has the advantage of one pound, and is yet equal in strength to the breech-loader. This extra weight is not much at the start, but in carrying all day will be found to amount to a great deal. Every sportsman knows that the muzzle-loader can be loaded on an average, ten times as often as opportunities offer to shoot it, and did he kill quail with it one half as often as he could load it, in two hours' time he would have more game than he would wish to carry. The time consumed in properly loading paper cartridges is much more than is required in charging the muzzle-loader. To me the loading of the latter is one of the pleasant features in shooting; it seems to be the proper time to load the gun when in the field, instead of doing it at home, which the use of cartridges amounts to. I consider it time well spent; it gives the dogs a short breathing spell, and if they are good ones they need it. By it the "down charge" is enforced, and it is the sheet anchor in dog management, and no dog is well broken that does not drop to shot and remain there, not till the locks click, but until ordered to hold up; and did sportsmen using breech-loaders make this a practice instead of man and dogs standing for the dead game, loading as they go, we would have better dogs, and their owners would keep in better temper, kill more game, and be better shooting companions. Quick loading and fast walking are accomplishments, but in shooting, head work will leave them far behind. Is it more desirable to make shooting a business than a pleasure?

The cleaning of the breech-loader is looked upon as such a simple operation that to many it has been the cause of abandoning the muzzle-loader. The cleaning of the latter was such a serious business that most people abandoned the gun or only attempted cleaning it from real necessity.

Did my muzzle-loader need cleaning while using it in the field, at the first spring or brook I should wash it with the aid of a sole-leather wad serewed to the end of the ramrod, dry it by pumping air through the barrels, substituting Eley's wads in place of the leather one—a few minutes operation. In washing a pair of barrels use cold water, drain with breeches down and trust nothing to dry them but a current of air forced through the barrels, with a cleaning rod with tow or rags.

It is conceded by all that clean barrels shoot. In this respect the muzzle-loader has a decided advantage, since in loading, it is in a great measure cleaned by the passage of two wads down the barrel just after the gun has been discharged, and the *residuum* of the powder is in a soft state and is easily removed. On the contrary the *residuum* is left on the inside of the barrel of the breech-loader. To judge of this, shoot a load from each barrel of a clean breech-loader, pass two wads down one barrel and compare the barrels by looking through them.

The trouble of carrying and reloading paper shells does not pay. In using third quality paper shells the expense is about fifty per cent more with the breech-loader.

The weight of a package of 500 No. 12 shells is twelve pounds. The space occupied by them is nearly a foot square, including the various articles used in loading and cleaning, and it will be found to add very much to the cost, weight, and bulk of the sportsman's outfit in traveling. In our varied shooting it is desirable to load to suit circumstances. Snap shooting in thick cover calls for small loads. With the muzzle-loader, one can load as he pleases, but with the breech-loader it is not safe to take chances by varying from the regular charge, and he can purchase all necessary articles at any country store if needed.

In selecting a breech-loader remember that simplicity is the great point to be attained in all machinery. It obviates the wear and tear and lessens the liability of getting out of order. The wear and tear of the breech-loader is very great, and as the joints become loose it is constantly increased in proportion to its use. The compensation arrangements are additions without being improvements, and I have yet to see a shaky breech-loader made sound and firm by a gunsmith, to the contrary notwithstanding.

Many new high priced breech-loaders are loose in their joints, and in purchasing I would recommend this fact by breaking down the barrels and examining if there is any side play to the lump in the action. The gun may be perfectly tight when locked and yet be very loose otherwise. Only the best are cheap and I much doubt if any class of goods sold more justly deserves the name of shoddy than the low priced breech-loaders.

CHECK CORD.

For Forest and Stream.

SPRING NOTES FROM THE ADIRONDACKS.

POSSIBLY the FOREST AND STREAM may not be offended at the receipt of a brief communication from this portion of the great Adirondack Wilderness. So, the day being a rainy one, and out-of-door operations not very inviting, I venture to send you a few paragraphs.

Reaching here on the 6th of May, I found the weather cool and dry, with prevailing easterly and northerly winds. A thin covering of the winter snow still remained broadcast over this entire region. No fresh buds were visible on the trees, and the "arbutus" was just struggling into bloom. The lakes and streams were low, and the ice still held many of the ponds in its cold embraces. For three or four days the mercury had revolved around the freezing point, ranging from twenty to forty-five degrees. The general aspect of nature was not cheering, as you may well imagine.

On the night of the 7th three inches of snow fell, and this discharge from the atmosphere had the effect of softening the temperature. The sun rose brightly upon the whitened landscape, and his warmer rays had such a melting effect that before mid-day hardly a vestige of the new snow could be seen. The following day the mercury rose to about seventy degrees, with a clear sky and balmy air; and thus suddenly and gloriously the spring burst upon the wilderness. Since that time the weather has been all that could

be desired; both days and nights have been warm and pleasant; the snow has disappeared and the woods are free to any who choose to enjoy their companionship.

The winter here, like the winter outside, has been an exceptional one. The oldest inhabitant cannot recall a milder one. In January the mercury rose to sixty degrees. On the first of April, a year ago, the snow lay on the ground to the full depth of five feet. This year, at the same date, there was not more than one foot left in the woods, except in the deepest recesses where the sun's rays never penetrate the darkness. This mild winter must have been highly favorable to the preservation of the deer, as these animals have been enabled to roam the forest at their pleasure, and find an abundance of wholesome food. The grouse, woodcock and partridge, too, have evidently passed a favorable winter, as they were never more plentiful in the thickets hereabouts as they are at present.

Of course this fine weather has not been without its natural effect upon the spirits of the trout, and you may drop your line into pond or stream anywhere with the assurance of success. The trout here are not as large as in some other favorite localities, but where they will average a pound or so, I think the results ought to be satisfactory. I think a fisherman who cannot be satisfied with this, is very hard to please, and may be set down as a constitutional grumbler. The fishing season is now fairly opened, and there will be lively sport for the next two months along the Beaver and its tributaries.

Although the wilderness bordering the Beaver River is not marked by that variety of scenery which is characteristic of the more northerly portions of the forest, the game is more abundant and the fishing better. The Beaver drains a large extent of territory, including thirty or forty ponds and lakes, some of the latter of which are of considerable size. Smith's Lake, too, near its head waters, is one of the most charming lakes to be found in the wilderness. It lies embosomed among hills rising to the height of five hundred feet; the thick forest touches its shores on all sides; a half dozen pine-covered islands dot its surface, and its clear waters swarm with speckled and salmon trout. Ten years ago few parties penetrated to its shores, but now few go in who fail to reach them. From Smith's Lake to the Raquette, the distance is about twenty miles, and from the top of "Pratt's Rock" the principal mountain peaks of the Adirondack region are visible to the naked eye. The view from this elevation is among the most interesting to be met with in the great wilderness. Mr. Verplanck Colvins' forthcoming topographical report will reveal much more of the Beaver River region than has heretofore been given to the public.

In the last number of FOREST AND STREAM brief reference is made to the Park bill, introduced by Hon. T. G. Alvord last winter. The bill failed to become a law, although assurances were freely given by many members of both Houses that the measure would receive favorable consideration. The true cause of its failure was probably a lack of time to perfect its details. It was not brought forward until March, whereas it should have gone on to the files in January. I have no doubt that, sooner or later, this measure will find legislative favor. The Park is a State necessity, or will eventually be so regarded; and when this period arrives people will wonder at the folly and stupidity which delayed its creation for so long a period. Allow me to add what I feel to be the truth, that Mr. Alvord's advocacy of this measure was based upon an earnest desire on his part to secure its adoption, and that he deplores its failure as much as any of its friends.

The delightful spring days of the past week have not only roused the trout into activity, but produced their wonted effect upon those who are in the habit of seeking these forest shades, as a happy deliverance from the cares and toils of business. The advance party, consisting of gentlemen from Utica, Cleveland and Pittsburg, passed up the river to-day, bound for the "Red Horse" chain of lakes. Other companies are on the way, and before the week closes many of the most desirable localities along the Beaver will be occupied. These spring parties do not usually remain as long as the summer visitors, ten days or two weeks being the ordinary limit of their stay. Fishing is their sole amusement, but of this there is plenty in spring time. Hunting is deferred until July, and this is six weeks in advance of the time allowed by law for taking the deer. But here every man is a law unto himself, and nobody thinks of prosecuting an offender against the laws of the State. The deer, however, would not suffer greatly by the destruction caused by summer parties alone. It is the systematic destruction of these animals in the late fall and early winter months, which promises to exterminate them at an early period, and deprive the wilderness of its chief attraction to the sportsman.

Persons seeking access to the wilderness here, leave the cars at Lowville. A trip of eighteen miles over a passable road brings them to the Beaver at "Number Four," a well-known locality, and where, at the "Fenton House," they always find excellent quarters for whatever time they may choose to spend there. Those who wish to pass further in can always procure guides in reasonable numbers by making known their wishes to the proprietors of the Fenton House. Parties from the south sometimes leave the cars at Martinsburgh Station, and run over to the Lewis House, at Beach's Bridge, where they find temporary quarters on very satisfactory terms. The guides here are as intelligent and serviceable as elsewhere, and ply as good boats as are furnished on the Raquette or Saranacs.

Beaver River, May 18th, 1874.

P. H. A.

A REQUEST.—A special demand for the issue of Feb. 12, 1874, of FOREST AND STREAM has almost exhausted our copies of that date. Any one having that number, which they do not wish to preserve for binding, will greatly oblige by forwarding it to this office, and we will cheerfully pay for it.

THE YELLOWSTONE VALLEY.—At the request of our correspondent "Monmouth," and to prevent misleading our readers, we make the following correction:

McPHERSON BARRACKS,
ATLANTA, Ga., May 19, 1874.

EDITOR FOREST AND STREAM:—

Last Thursday's number of the FOREST AND STREAM, I notice, contains my article on the Yellowstone Valley. As some of your readers may pick you up on the statement that "we struck the Yellowstone in eight hours" from Fort Ellis; and my copy (manuscript) of the article reads "struck the Yellowstone and followed it up, entering," &c., do not forget that it is at least three days' journey from Fort Ellis to the entrance of the Canon. There are trout streams every few miles all the way. By-the-by, may not some of these peculiar trout of the Yellowstone Valley and River prove to be grayling?

Rational Pastimes.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

—Seven American Cricketers of the Merion club visited New York on May 21st, to play the St. George club of this city, they being unable to muster a full eleven on leaving Philadelphia. They were met at Hoboken the same day by nine of the St. George eleven who were short handed as usual, and late in the afternoon a two days match was commenced, rain preventing play at the hour appointed. On the 21st the St. George men sent new men to the bat for a score of 86, Bema Whelan, their new professional, Sleigh and Moeran contributed double figures. The same afternoon the Merions scored 55 with but two wickets down in their first innings, Fox and Ashbridge making a good stand. The next day they ran their score up to 88, leading St. George two runs on the first innings. In the second innings they disposed of eleven of the Dragon Slayers for 20 runs only, and then went in and won the game easily with eight wickets to fall. A hail storm interrupted the second day's play, occasioning a new wicket to be laid out. Fox bore off the palm at the bat with 51 in one innings, he making two fine catches, R. Ashbridge being next. G. Ashbridge finished the game with a six hit to-leg. Hance led the score on the other side. The following is the score:

Total runs by fielding errors—St. George, 8; Merion, 10.

Time of game—5:10.

The St. George Club go to Philadelphia on Decoration Day to play the Germantown Club.

—The Prospect Park Cricket Club—an organization of Brooklyn journalists—opened play for the season on May 23d, on their splendid field at Prospect Park, and after a practice game held a meeting at their club rooms adjoining the field, at which the following officers were duly elected for 1874. President Mr. John Y. Culyer, Chief Engineer Prospect Park; Vice President Mr. A. McLean, managing Editor of the Eagle; Secretary Mr. A. W. Peters, of the Faust Club; Treasurer Dr. Drayton, Secretary of the Coney Island R. R. Company. After the meeting there was a re-union of the members at the club room where the President invited them to an elegant supper prepared by Mr. Prozart of the Park Shelter House. Toasts, songs and speeches were made and a great time had generally. On Decoration Day the married and single members of the club have a match together.

—The St. George and St. Louis cricket clubs of St. Louis played their first match of the season on the 23d May, on the grounds of the latter. A close game resulted. The St. George claim to have a better eleven than the "United" of last year; at any rate they have Richardson, Dale and Allen, three formidable batters, and Mordaunt and Webb, two good bowlers. The St. Louis have no bat so brilliant as Richardson, but their team is a very even one and their fielding should be first class.

—Some stirring events have transpired in the professional championship arena since the last issue of the FOREST AND STREAM, the most noteworthy being the great defeat sustained by the champion "Reds" of Boston. They had previously met and encountered every nine in the arena except the Chicago White Stockings, and defeated each with apparent ease, and returning home triumphant with the captured Atlantics, were surprised in their own camp, on May 23d, and taken prisoners to the tune of nine to three. Their previous career had been marked by the following signal victories.

- Boston vs. Baltimore, at Baltimore, 3 to 2.
- " vs. Atlantics, at Brooklyn, 6 to 2.
- " vs. Hartford, at Hartford, 8 to 1.
- " vs. Atlantics, at Brooklyn, 8 to 1.
- " vs. Athletics, at Boston, 10 to 4.
- " vs. Mutuals, at Boston, 11 to 4.
- " vs. Mutuals, at Boston, 12 to 3.
- " vs. Baltimore, at Boston, 14 to 0.
- " vs. Philadelphia, at Philadelphia, 16 to 7.
- " vs. Athletics, at Philadelphia, 18 to 7.
- " vs. Mutuals, at Brooklyn, 20 to 14.
- " vs. Hartford, at Boston, 25 to 3.
- " vs. Baltimore, at Boston, 28 to 7.

Their first defeat in Boston was the result of their allowing the Atlantics to score 7 runs in their first innings; a lead the Reds tried in vain to offset. In the following eight innings of the game the Reds made 3 runs and the Atlantics 2, the latter winning by a score of 9 to 3. It was the Atlantic club which first broke the string of victories of the celebrated Red Stockings nine in 1870, and it will be seen that they gave the Reds the closest games of their recent tour.

—Collins and Peters of the St. Louis Red Stocking nine have been engaged as professionals of the Chicago club in place of Mesyrole and Glenn retired.

—The American Base Ball Eighteen who are to play at cricket with the English Twelve of 1872 at Lord's ground in London on August 3d next, began a series of practice

games on May 21st at Philadelphia, on which occasion the Boston nine with Harry Wright, and the Athletic nine combined together in a match against the eleven of the famous Young America club—the champion cricket club of the United States—at Germantown, and in the presence of a large concourse of interested spectators, the base ball players managed to come off victors in the one day match, owing to the impossibility of playing the game to a close, the stumps being drawn at dark when the eleven had five wickets to go down and only 15 runs to get to win. The full score below will give our English readers across the water some idea how well our base ball representatives can play cricket.

Umpires—T. Rhodes and E. Hopkins.

—But few good games are now being played by our local amateur clubs, chiefly in consequence of their persisting in playing under the crude code of rules adopted at their late convention in this city, the objectionable feature of which code is the undue latitude given to wild pitching, by the absurd rule introduced governing the delivery of the ball to the bat. By this rule pitchers are allowed to do just as they like almost, while the strikers are obliged to strike at every ball pitched over the bat. The game at Fordham on May 20th between the Fly Aways and the Rose Hills afforded a sample of the working of the amateur code in this respect, and a still further proof of its bad effects was shown in the Nameless and Rutgers game at Prospect Park on May 23d. The following scores of amateur games as thus recently played under this code, shows its working plainly enough.

May 20, Fly Aways vs. Rose Hill, at Fordham, 27 to 14.
May 21, Alert vs. N. Y. University, at Orange, N. J. 42 to 4.
" 23, Montague vs. Blagden, at Capitoline grounds, 51 to 8.

May 23, Nameless vs. Rutgers, at Prospect Park, 26 to 14.
A very pretty game was played at Central Park on May 23d, the opening day for ball playing at the Park, between the Young Eagle and Armenian clubs, the latter winning by a score of 6 to 4 only, in a seven innings contest. The other game played was marked by large scores. During one game a boy named James Byrnes was hit on the head by a bat slung from the striker and he was carried home insensible.

—The model contests by the professional nines this season, thus far, have been the following:

- Boston vs. Baltimore, at Baltimore, 3 to 2.
- Chicago vs. Athletics, at Chicago, 4 to 0.
- Athletics vs. Atlantics, at Brooklyn, 5 to 2.
- Boston vs. Atlantics, at Brooklyn, 6 to 2.
- Philadelphia vs. Hartford, at Philadelphia, 6 to 4.
- Athletics vs. Philadelphia, at Philadelphia, 7 to 1.
- Athletics vs. Chicago, at Chicago, 7 to 2.
- Mutual vs. Chicago, at Chicago, 7 to 4.
- Boston vs. Hartford, at Hartford, 8 to 1.
- Boston vs. Atlantic, at Brooklyn, 8 to 2.
- Atlantics vs. Baltimore, at Brooklyn, 8 to 3.
- Mutuals vs. Baltimore, at Brooklyn, 8 to 5.
- Mutual vs. Athletics, at Brooklyn, 8 to 5.
- Atlantics vs. Boston, at Boston, 9 to 3.
- Baltimore vs. Hartford, at Baltimore, 9 to 7.
- Baltimore vs. Athletics, at Baltimore, 9 to 8.

In these finely played games, as the score shows them to be, the Athletics played in six, winning three; the champions participated in five, winning four; the Atlantics in five, winning two; the Baltimores in four, winning two; the Mutuals in three, winning all; and the others in two each, winning one each, except the Hartford which lost both.

—Nearly 8,000 visitors have registered at the St. James and Grand National hotels in Jacksonville, Florida since November.

—Can't a manufacturer of condensed milk very properly be termed a cream-machinist?

AT THE WOOD'S EDGE.

TWO walked out of a wood by pleasant ways
A wood wherein each breath did wake delight.
There charmed trees, that stirred not through the days,
Shook delicate spray-drops off at touch of night,
That in the morn were blossoms to the sight,
And sprang in honeyed clusters 'neath the tread.
Never was any wood so filled with praise
Of singing creatures in the air o'erhead.
Now at the very verge of this sweet maze
There grew a rose tree, half in shade, half light;
And all its blossoms that outward leaned were white,
And all that drank the dusky shadows, red.
And as the twain passed out beneath its bower,
Each put forth careless hand and plucked a flower.

Then cheerly fared they onward, till one turned
Downward her timid eyes, and saw—alas!
In her fair hand the rose was red, and burned
Like a soft flame; pure white the other was!
Then crimson grew her forehead. "Nay," said she,
"Were they not gathered from the self-same tree?
I will straightway go change. So swift she sped,
No smallest flower had time to hide its head.
Her lustrous eyes, dark with sweet wood shadows,
Did seem to change the hue of any rose
Whereon they fell. Turning her face, she broke
A fair, milk-throated blossom from its tree,
Yet thrust the other, when no eye did see,
Into her bosom. Resting 'neath an oak,
Her way-mate soon she joined, and neither spoke;
Nor any knew that still, on ways made bright
With wholesome suns, she holds—close hid from sight—
The faded red rose dearer than the white.

Galaxy.

Natural History.

For Forest and Stream.

THE GREAT AUK IN NEWFOUNDLAND.

WHEN the island of Newfoundland was first discovered, and for two hundred years afterwards, the numerous low rocky islands off the eastern coast were the haunts of that remarkable oceanic bird, the Great Auk, which is now believed to be extinct. The Penguin, Wadham and Funk Islands, and the countless islets which stud the bosom of Trinity, Bonavista and Notre Dame bays, were the favorite resorts of the Great Auk, where they were to be found in incredible numbers. From these islands which were their breeding grounds they spread over the neighboring seas, so as to be a sure sea-mark to the mariners on the edge of and inside the banks, when they were drawing near the shores of Newfoundland. When the sailors of the 16th and 17th centuries fell in with the flocks of the Great Auk, they knew that they had reached soundings on the banks, and the sight of these great birds paddling rapidly with their wings over the surface of the ocean, or diving after their prey, was very welcome to the weather-beaten tars of those days. They were accustomed to depend on the Auks for a supply of fresh provisions, their flesh being savory and wholesome, while their capture was a very simple matter. Not only were the crews of the fishing vessels in the habit of consuming vast quantities of these birds fresh, but they were accustomed to salt down many tons of them for future use. Landing on the islands where they were bred, the sailors also took off whole boat-loads of their eggs. On land, the poor helpless Auks patiently waited to be slaughtered, one after another, being unable to make any effort to escape, their wings being useless for flight, and only of service as paddles in the water. Armed only with sticks, the sailors landed, and in a short time filled their boats with these plump unwieldy birds who quietly awaited their turn to be knocked on the head. Nay, so accommodating were they that even on their proper element, where, by using their short wings as paddles, they could move about with astonishing rapidity, they allowed themselves to be captured in any quantity. Not only so, but it is stated on good authority, that they were obliging enough to "walk the plank" into a boat from the sea, when the sailors pushed out a gangway and drove them along it. This fact is attested by honest Captain Richard Whitbourne, who, in the reign of James I. published a book, a copy of which was sent by that monarch to each parish in the kingdom, in order to induce Englishmen to emigrate to the "New-Found-Land." Whitbourne speaks thus of the Auks, or "Penguins" as he named them in this volume: "These Penguins are as bigge as geese and flye not, for they have but a little short wing; and they multiply so infinitely upon a certain flat island that men drive them from thence upon a board into their boats by hundreds at a time, as if God had made the innocency of so poor a creature to become such an admirable instrument for the sustentation of man." Thus quaintly does old Whitbourne moralize upon the "innocency" of the Auk which proved so very convenient for the hungry sailors of those days.

It is evident that in "the battle of life," such a bird as the Great Auk had but a poor chance. In a world where competition for available provisions is so keen, where "the struggle for existence" is so terrible, and where only "the fittest" survive, such a simpleton as the Great Auk must ere long be gobbled up. When the fat "innocent at home" actually walked into the mouths of its foes—great gawk that it was—its doom must be annihilation, sooner or later. Such proved to be the case. The reckless sailors ate it fresh and salted; feasted on its eggs; burned its body for fuel, in order to warm water to pick off the feathers which were of much value; and after slaughtering the gawky birds till they were weary, they shut up huge flocks in low stone enclosures, in order to have them ready when

wanted. The merchants of Bonavista, and other localities, during the winter season, used to sell these birds to poor people by the hundred weight, instead of pork. Year after year, this war of extermination went on and their numbers were vastly thinned.

The Penguin Islands, on the northern coast, which were little frequented, afforded them a refuge for a time, but they were at length pursued even here, and finally disappeared entirely, and for many years not a single Auk has been seen where once the ocean was alive with them.

It is the opinion of the best naturalists that the Great Auk, like the Dodo, is now extinct. In Wood's Illustrated Natural History, (page 471,) we are told that "almost the last living specimens known were seen in the Orkneys, and were quite familiar to the inhabitants under the name of King and Queen of the Auks. So agile is (or was) this bird in the water that Mr. Bullock chased the male for several hours, without being able to get within gun-shot, although he was in a boat manned by six rowers. After his departure, the bird was shot and sent to the British Museum. The female had been killed just before his arrival." It appears, however, that the bird was seen at a later date, as the following extract from *Links in the Chain* indicates: "The last known breeding places of the bird are two isolated rocks, extremely difficult of access, off the south coast of Iceland; and at long intervals, sometimes of ten or fifteen years, a few individuals have been obtained thence, up to the year 1844. In that year a pair of birds, male and female, were shot at their nest, on a little islet, near to one of the former breeding places; and since that time, notwithstanding that the most careful search has every where been made for it, the Great Auk has no where been seen alive." Colonel Drummond Hay, however, has recorded the fact (Ibis, 1861, page 397) of a living specimen of *A. imperialis* being seen on the banks of Newfoundland so recently as 1852, and also of another being picked up the following year in Trinity Bay. This would seem to warrant the hope that if a search were made among those surf-bound and dangerous islands along the southern and eastern coasts of Newfoundland, which are seldom approached by vessels, it might be attended with success, for if any localities are likely to hold living specimens of the bird it would seem to be some of these rocky solitudes rarely trodden by the foot of man, which were once the headquarters of the Great Auk. Mr. Reeks, a distinguished English naturalist, who spent the years 1868 and 1869 on the western shore of Newfoundland, collecting specimens, heard among the settlers there that "a living pin-wing was caught by one Captain Stirling twelve years before," and old settlers remembered seeing the living bird fishing in the mouths of Bonne Bay, Bay of Islands, and Bay St. George. The settlers call it "Pinwing," and Professor Newton considers that "Penguin" or "Pingwin" as it is often spelled, is but a corruption of the word pin wing, from the fact that the operation known as "pinioning" is called "pin-winging" in some parts of England, and had been applied to certain sea fowl, which being unable to fly appeared to have been "pin-winged." Mr. Reeks clings to the belief that living specimens of the Great Auk still exist on some of the lonely islands around Newfoundland.

However this may be, certain it is that Newfoundland contains numerous skeleton remains of the bird. The most perfect skeleton known to be in existence, now in the British Museum, was found along with two others on the Funk Islands in 1864. They came into the possession of Rev. Dr. Field, Bishop of Newfoundland, who sent one to Professor Agassiz which I presume is now in the Cambridge Museum, Mass.; a second to Professor Newton, and the third to Mr. Jones of Halifax, who sent it to the British Museum. These skeletons were found under drift ice by a person who had visited the Funk Islands to collect guano. The islands are uninhabited and now rarely visited, and it is every way probable that many more specimens might be found there. If Cambridge Museum contains the specimen sent to Agassiz, I believe it is the only one on this side of the Atlantic. Professor Baird has been making strenuous efforts to get one for the Smithsonian, but hitherto without success.

It must have been a singular sight, two hundred years ago, to see these wild lonely islands literally covered with these strange birds, as they waddled slowly about in an erect position, with their broad webbed feet, and short wings, resembling the flippers of a seal. In fact they were the connecting link between the fish and bird, partaking of the nature of both. In these lonely islands they were the sole occupants, for many centuries, in all probability. *The English Pilot* for 1774 thus refers to them: "They never go beyond the bank, as others do, for they are always on it or within it, several of them together, sometimes more, sometimes less, but never less than two together. They are large fowls, about the size of a goose, a coal black head and back, with a white spot under one of their eyes, which nature has ordered to be under their right eye,—an extraordinary mark. These birds never fly, for their wings are very short, and most like the fins of fish, having nothing upon them but a sort of down and short feathers." Wood says in his *Natural History*, (page 417,) "the egg are variable in size, color, and markings, some being of a silvery white, and others of a yellowish white ground, and the spots and streaks are greatly different in color and form, some being yellowish brown and purple, others intense blue and green. The upper surface of this bird is black, except a patch of pure white around and in front of the eye, and the ends of the secondaries, which are white. The whole of the under surface is white, and in winter the chin

and throat are also white. The total length of the bird is thirty-two inches." The legs of the Great Auk were extremely short but powerful, and placed so much posteriorly that, in resting on the rocks, the birds assumed an upright attitude, the whole of the legs and toes being applied to the surface. The toes were three in number and fully webbed, the hind toe being rudimentary. The bill was compressed laterally and grooved at the sides. The Auks are natives of the northern hemisphere; the Penguins take their place in the southern. They were once common, not only on Newfoundland, but in Greenland, Spitzbergen, Iceland, and Norway. The Little Auk, the Razor-billed Auk, Puffin and Guillemot, all belonging to the same family as the Great Auk, are common around the coasts of Newfoundland.

M. H.

THE DODO.

SMITHSONIAN INSTITUTE, Washington, D. C.

EDITOR FOREST AND STREAM:—

On page 234 of your issue of May 21st, I notice an article upon the dodo, stating that this bird had recently been captured alive in the Navigator Islands by Dr. A. B. Steinberger. The bird which this gentleman secured was not the dodo, but the dodo pigeon, (*Didunculus strigirostris*), a species which is well known to ornithologists and which exists in more than one museum, the National Collection having had a good mounted example for many years. Though a member of the pigeon family, the present species is so aberrant that Bonaparte instituted in 1850 a separate family, (*Didunculidae*), for its especial accommodation; but its characters scarcely warrant so wide a removal from the true pigeons, and Gray's sub-family, (*Didunculinae*), may be accepted as a probably more truthful expression of its relationship. The generic name of the dodo pigeon, (*Didunculus*), signifies "little dodo," and was suggested by the resemblance of many parts of the bird to those of the dodo, (*Didus ineptus*.) It is perhaps needless to add that the latter bird is yet known only by the few fragmentary remains which have been preserved, and that ornithologists need not hope ever to see better evidence of its former existence.

ROBERT RIDGWAY.

[We were seasonably advised through authentic scientific sources, by letters addressed personally to us, not to put confidence in the alleged discovery of a live dodo by Dr. Steinberger, but the article in our paper, which was taken from one of our city dailies, was already on the press and could not be recalled. We thank the writer of the above article and our numerous naturalist friends for the earnest interest they manifest in maintaining the character of this paper for scientific correctness. One of these dodo pigeons is now on exhibition at Mr. Reiche's, in Chatham street, near our office.—Ed.]

DAVENPORT, IOWA, May 15, 1874.

EDITOR FOREST AND STREAM:—

In your issue of April 30th, page 180, there is a letter from C. E. T., asking your opinion in reference to the time that salmon return from the sea to the stream, where they were spawned. Your correspondent speaks of an "old experienced Scotchman" who told him "that salmon in Scotland, spawned in winter, come back from the sea as grilse weighing from four to seven pounds. The second season they come back as spawning salmon." Do you, Mr. Editor, understand him that those that were spawned in say the winter of 1872, come back in the fall of 1873 as grilse and in the fall of 1874 as spawning salmon? If so, the old Scotchman was never under a greater mistake. What becomes of their nearly two and a half years of parr stage of life before they leave their native stream to go to the sea? I was raised on a salmon stream in Scotland and for fifty years have been a fly fisher for salmon and trout, though, in my present locality, I have to content myself with throwing a fly for black bass. In Scotland I studied carefully the habits of salmon and trout, their spawning time, when they migrated to the sea, and the seasons of their return.

In the west of Scotland the salmon spawn during the months of October and November, the following summer and fall they, the young, are about from three to four inches in length, the following year they, of course, are larger, by the fall some of them will weigh two ounces, seldom over that, and during these two years are known as parr. In the following spring they change their appearance: While a parr they resemble a small brook trout in color, having a row of dark oval blotches along their sides; but in the spring their back assumes a bluish black color, and the sides and belly the bright silvery appearance of the salmon; they are then on their way to the sea, this is during the months of April and May; and in the River Clyde, in Scotland, not one of them are seen by the last of May. After they experience this change in their appearance they are no longer known or termed parr but salmon fry. Thus those salmon eggs that are hatched, say in the fall of 1871, do not leave their native stream for the sea till the spring of 1874.

I presume, Mr. Editor, that you are acquainted with the experiments and observations of Mr. Shaw, of Scotland, an intelligent game keeper on a large estate, who proved to a demonstration the correctness of what I have above stated. In the fall, previous to the spring in which the parr changes his appearance ready to go to sea, I have caught some large males that were full of melt, but I never saw a female parr with roe in them. Mr. Shaw successfully impregnated the roe of a large salmon with the melt of the male parr. Any of your readers who are interested in the history of the salmon during its parr state up to the mature fish can find it in Chamber's Encyclopedia, furnished by Mr. Shaw. I have spoken above of the salmon in the streams of the west of Scotland; what may be their habits on this continent I know not from my own observations, having never resided any length of time away from this vicinity. I am much interested in reading the many very desirable articles in your paper on fish and fishing.

WM. GRAY.

For habits and natural history of salmon see "Hallock's Fishing Tourist," pages 33-35.—Ed.]

—The Maryland Legislature recently passed a law protecting trout.

—We acknowledge the receipt from "Jacobstaff" of a beautiful specimen of the rail bird, mounted by Wallace, which is mentioned in our Natural History department as having been found in this vicinity last week, killed by striking a telegraph wire in its flight. Herewith he gives some hints respecting rail shooting, which our sportsmen may find serviceable at the proper season. He says:—

"The sora, when driven up almost from under the bow of the boat, with legs hanging, flutters feebly over the tops of the reeds for sixty or eighty yards, when it drops again to shelter. It affords an easy shot, even to a tyro. But rail shooting, with proper accompaniments, is fun, and no mistake. With a high tide, and a good pusher or poler (the latter of which is decidedly a *sine qua non*) the sport grows fast and furious. With dozens of other boats, with their shooters, around you, the incessant cracking of the fowling pieces, the rising as well as the falling birds, and the angry excitement of your man, as in the excitement you miss two birds in succession, or still worse, get your shot down before the powder, all this tends to create a heat in your blood that is really exhilarating. The feeling of rivalry among the shooters is largely engendered, each trying his level best to outdo the other. Maryland or Virginia, we understand, furnish the best fields for good bags. We have heard that on the Delaware River as many as sixteen dozen have been brought to boat by a single gunner on a tide. Opposite the mouth of Kinderhook Creek, on the Hudson, is a mile or two of flats that in the fall furnishes good feeding. There, with Captain Wild and his son Joe as pushers, we have in less than three hours bagged ninety-two. I believe the captain and his son have killed as high as 148 on a single tide, but this, I think, is rather rare for that region. In the fall the rail becomes very fat, feeding on the seeds of the water reeds, and are indeed delicious eating, outrivalling the celebrated ortolan of France. I hope I shall be able to try a tide among them this season. Can't you go, too?" "JACOBSTAFF."

WATERVILLE, ONEIDA COUNTY, N. Y.

EDITOR FOREST AND STREAM:—

Reading in your issue of May 21st, the article of a correspondent finding a rail on the public highway dead, and the same correspondent asking if other persons had seen any bird of the same feather during the month, induced me to write of a coincidence. On the 19th of this month, a neighbor of mine, riding from our place to Clinton, through the Oriskany Creek valley, found dead on the road a rail in full plumage, with no visible mark of injury.

On skinning the rail no shot-holes were found, but on the breast the flesh was discolored, black and blue, showing, I think, conclusively, that the bird had received a blow from collision with some hard body, causing its death.

R. S. B.

MIGRATION OF BIRDS.

PORTLAND, Me., May 12, 1874.

EDITOR FOREST AND STREAM:—

There is a matter I would like to suggest to your editorial consideration; it is this: That you call upon your correspondents throughout the country to give you the dates of arrival of migratory birds at their locality, especially the ducks, snipe, plover, &c. It would be valuable as a matter of scientific knowledge, and of great assistance to the sportsman. Many of the birds are more regular in the dates of their arrival (without regard to season or weather) than most people imagine. I will give a few instances in this locality: Canada geese arrive March 20, seldom varying three days, and the first flight of black ducks, *anas obscura*, comes with them or immediately after. The second flight of black ducks comes April 6, or between the 4th and 8th. This year they struck here at 10 A. M. of the 6th, as I can testify from personal observation, being on their favorite ground from the 4th until the 7th, seeing none save first flight birds until the forenoon of the 6th, and then my friend and self bagged 30 before 4 P. M., losing about half our birds for want of a good retriever. But the most reliable bird of all is the dowitcher, here called "brown duck," the *Scotopax noveboracensis*, of Wilson. This beautiful little bird appears on the Scarborough marshes (5 miles from this city) on the 25th of May, almost as regularly as the day itself. Since 1848 the widest variations have been May 20 and May 28, in both of which cases but few birds were seen, and I am satisfied were stragglers from the main flight. May 25, 1868 was the largest flight I ever saw. They extended from horizon to horizon, and the flight lasted over three hours six miles out at sea (at right angles with their course). From where I was the same sight presented itself. This body of birds must have been 12 or 15 miles wide and at least 100 long. They did not "darken the air," but were in bunches from a dozen to several hundred, and were visible in all directions. They make no stop with us in the spring (the eggs being about 1/2 inch in diameter in the females), and the male birds are back here on their way south as early as July 4th, but usually not until the 15th. Females and young arrive the 1st of August. They are fat almost to bursting in May, but in poor condition when they return.

MANNASSEH SMITH.

REMARKABLE DEER HORNS.

EDITOR FOREST AND STREAM:—

We frequently hear how two well antlered bucks in chivalrous contest for the championship of some herd of does become victims of their rage; but I have never seen such perfect evidence of it as is given by two skulls with horns, that were shown at the office of the National Hotel, Jacksonville, Fla. The horns were fine and strong, and were borne by bucks of equal age and size, and beyond doubt it was a long and determined fight that so inter-locked these antlers as to forever prevent their separation.

By some powerful charge, with all the force of each animal, they had sprung open the tines of their powerful horns, and by struggles and wrestling so jammed them in a complex tangle, that with their anger gone, their courage tamed by hunger, and their timidity awakened, they had been unable to escape from one another until from starvation, or from the attacks of animals they were helpless to flee from or defend against, they died, leaving their united horns to bleach in the forest until found by a negro. One sharp point had been thrust through the jaws of one, antagonist and striking a back tooth on the opposite side, had broken off both the horn and the molar, and the shivered end of the tine filled the vacant place. They were objects of unusual interest to the many sportsmen who saw them there, and have since been purchased by a gentleman from New York. A pair of antlers, with head, from a buck killed near Savannah I saw in that city, and would gladly describe them, but even a photograph will hardly convey an idea of them. They were carried by a deer of unusual size, and not only branch out from the main horns, as is common, but the tines themselves are divided, in some cases with flat double points, reminding one of the three-pointed caribou horns. They are very symmetrical and more massive by far than any horns of the red deer that I have ever seen, having in all twenty-four (24) points. Indeed, but for the unmistakable head bearing them, one would regard them as belonging to an animal of some variety larger than the Southern deer and of different character.

If the excellent and accomplished sportsmen of the South would found a museum of native animals and birds and gather in it the spoils of their chase, it would soon become one of very great variety and interest.

L. W. L.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, May 24, 1874.

Animals received at Central Park Menagerie for the week ending May 23, 1874:

One Rattlesnake, *Crotalus durissus*. Presented by Mr. H. N. Strong, Portland, Conn.
One Pelican, *Pelecanus fuscus*. Presented by Wm. C. Ryan.
One purple Gallinule, *Gallinula martinica*. Presented by Mr. W. S. Pearson, S. S., State of Texas.
One Mocking Bird, *Mimus polyglottus*. Presented by Mr. T. U. Parker.
One small Alligator. Presented by Mr. Charles C. Overton.
One Burchell's Zebra, *Equus burchelli*.
One Zebu and Calf, *Bos indicus*.
Six Silver Pheasants; bred in the Menagerie.
Mr. Henry Reiche, of No. 55 Chatham street, N. Y., set loose on the Park thirty pair of English skylarks, ten pair of chaffinches, and some woodthrushes.
W. A. CONKLIN.

Woodland, Lawn and Garden.

AQUATIC, OR SUB-TROPICAL DECORATIONS.

"Many for many virtues excellent,
None but for some, and yet all different;
O! mickle is the power and grace that lies
In herbs, plants, stones and their true qualities,
For naught so vile that on the earth doth live,
But to the earth some special gift doth give."

"When proud pied April, dressed in all his trim,
Hath put a spirit of youth in everything."

SHAKESPEARE.

AMONG the most charming arrangements of our city, as well as suburban gardens, are what we term the tropical or "water gardens." These may be made a partial or a special element in garden decoration. As a specialty, or devoted entirely to plants that grow near or in the marshy, woody grounds of our river borders, or in water courses, are many that can be made to produce the very finest effects with but little care.

Every one who loves quiet, shady nooks, and the little meandering streams that silently take their way through our woods, will notice there is a peculiarity of foliage belonging to these plants. There are many flowers, however, which are specially adapted to a little stream of water gliding through a garden or a little artificial pool beside the rock work beneath the shade trees. Flowers for water gardens are of two kinds—aquatics, so-called, or water and marsh plants, with which to surround the border of your plat and place within the niches of your rock work. These plants are propagated by seeds, and by divisions of the roots. The seeds of most kinds must be planted beneath the water; otherwise they grow well under the same general treatment as other herbaceous plants. Among the plants we have used as water plants with success we name the following, which comprise a very fine list of hardy, useful flowers—aquatic flowers that may be termed showy, blossoming in May and June; color red—*Equisetum fluviatile*, *Hydracole vulgaris*. White—*Nasturtium officinale*, *Ranunculus aquatilis*, *Hydrocharis morsus-ranae*, *Phyllanthus spicatus*, *Nymphae albas*. Blue—*Veronica beccabunga*, *Equisetum palustre*. Red—*Butronnus umbellatus*. Purple—*Utricularia vulgaris*, *Trapa natans*, *Sagittaria sagittifolia*. August—red—*Hydopeltis purpurea*, *Lobelia datmanica*, *salvias*. To these we add the calladiums of the different species, which can be obtained ready potted and well grown, and when placed in moist situations commence growing at once, and the peculiar arrow-shaped leaves, when properly cared for, have a fine effect. Some of the large, hardy ferns are to be introduced about one third of the distance of the circle of rock work. Small ferns, and the various sorts of polypody, sedmus, and the pitcher plant, found in bulbs in wet places in the water courses of the woods, can easily be removed, and if gently placed in flat baskets can be carried with safety from their old wood homes to their new abode in the garden. To a person not accustomed to look upon these little aquatic gardens the sight of one well cared for would afford them a pleasure heretofore unknown. The introduction of the *Nymphae alba*, or white pond lily, will amply compensate any one of our lady amateurs who attempts to transfer one from the pond to her garden. Early last spring we procured two roots and placed them in a large sized flower pot, manuring the roots well, and filling the pots with sand and pebbles, and then sinking the same some three feet within the water in our rockery we awaited patiently the crowning blossom. In due course of time we received our reward. First, far down into the crystal waters we saw the tiny buds peeping up, and soon they burst forth in all the well known fragrance of the pond lily of the lake. All this beauty, and much in addition, can be had for a very little care, and the exercise of a little judgment in the selection of the proper flowers. The web mosses of various kinds can here be well used, and many pendant plants that bear easy transportation will live well in their new homes.

Daisies thrive well in moist places, and add life and beauty to such little spots in the sunshine or shade of any garden. Harmony of color is always to be observed in the arrangement of these gardens. To have a well-filled selection of good plants is one thing, and to have all the plants you want is another thing; but this is not enough. They must be carefully arranged as to harmony of color. They are much influenced by their *vis a vis*. It is not good for even flowers to be alone, but we had much rather see them solitary and alone than in bad company. You are expected to remember, just in this place, that certain flowers, when placed contiguously, appear to intensify each other's depths, to add a deeper tone to their beauty. Again, certain flowers of great beauty in themselves alone, when placed in a

bad juxtaposition, lessen very much, or totally destroy, the beauty of others. Thus you will at once see the reason of this necessary harmony of the garden arrangement. How very suggestive is the simple button hole bouquet when the tasty grouping of a few tiny buds produces such graceful and pleasurable effects.

Riding by a densely wooded swamp in the State of New Jersey, we once beheld the stately cardinalis, with its blood red blossoms, springing up with a background of white azalias. The exclamations from the ladies around us were, "O, how beautiful!" "O, how exquisite!" It was so. Nature, in her careless grouping of the green, the scarlet, and the white, here taught a passing lesson of the beautiful that at least one of that party will never forget. This is what I now expect, that you will devote some attention to the effect of contrast as applied to the grouping of your flowers and plants in the garden bed. This, I believe, you are quite able to do, provided you have given due attention to the rules and suggestions laid down in the foregoing papers. I could very easily illustrate my meaning; I could tell you just what flowers to set, and how they would combine, either harmoniously or inharmoniously, but I believe you can do it as well as myself after two or three trials.

OLLIPOD QUILL.

CURIOSITIES OF GRAFTING.—There are many curious facts about vegetable life. We can, for example, graft the apricot on the plum, and the peach on the apricot, and the almond on the peach, and thus we may produce a tree with plum roots and almond leaves. The wood, however, of the stem will consist of four distinct varieties, though formed from one continuous layer. Below the almond wood and bark we shall have perfect peach wood and bark, then perfect apricot wood and bark, and at the bottom perfect plum wood and bark. In this curious instance we see the intimate correspondence between the bark and the leaf, for if we should remove the almond branches we might cause the several sorts of wood to develop buds and leafy twigs each of its own kind. Each section of the compound stem has its seat of life in the cambium layer, and the cambium of each reproduces cells of its own species out of a common nutrient fluid.—*Massachusetts Ploughman*.

THE BAOBAB.—The baobab is a plant of monstrous size, the most colossal and the most ancient vegetable monument on earth; has round, woolly leaves, which consist of from three to seven leaflets, radiating from a common centre, and giving them somewhat the appearance of a grand and magnificent white flower. It is an enormous tree, holding among plants the place that the elephant holds among animals—a hoary witness of the last changes which the earth has undergone, and deluges that have buried beneath their waves the productions of early ages. Several baobabs that have been measured were found to be from seventy to seventy-seven feet in circumference. From its branches hang, at times, colossal nets, three yards in length, and resembling large oval baskets, open at the bottom, and looking from the distance like so many signal flags.

It would take fifteen men, with their arms extended, to embrace the trunk of one of these great trees, which, in the countries through which the Senegal flows, are venerated as sacred monuments. Enormous branches are given off from the central stem a few feet from the ground and spread out horizontally, giving the tree a diameter of over 100 feet. "Each of these branches," says Mr. Danton, "would be a monster tree elsewhere, and, taken together, they seem to make up a forest rather than a tree." It is only at the age of 800 years that the baobabs attain their full size, and then cease to grow.

The fruit of this tree is oblong; the color of the shell passes in ripening from green to yellow and brown. The fruit is called "monkey bread." It contains a spongy substance, paler than chocolate, and filled with abundant juice.

The bark is ashy gray in color, and almost an inch in thickness. The negroes of the Senegal grind it down to powder, and in this state they use it to season their food, and to maintain a moderately free perspiration, which enables them the more easily to withstand the heat. It serves also as an antidote for certain fevers.—*Wonders of Vegetation*.

SALE OF SHORT-HORNS.—There was an important sale of blooded cattle on the farm of Mr. Charles E. Coffin, at Muirkirk, twenty-five miles from Baltimore, last week. The herd consisted of forty-two cows and heifers, and twelve bulls. The progenitors of the herd included some of the very best bred animals in this country or Europe, the herd being mainly descended from the Bates, Booth, Princess, and Gwynne families. Twelve of the best animals in the herd will go to Kentucky, seven to Virginia, five to Ohio, five to Pennsylvania, three to New York, and three of the best heifers will go to Canada West, and one to Connecticut. The thirty-nine cows, heifers, and calves disposed of brought \$20,530; the eleven bulls sold for \$2,270, making a total of \$22,800. The prices ranged from \$100 to \$1,425, the three highest being these: Portulacca, a handsome, solid red heifer, coming four years old, bred by S. Christy, Chelmsford, Essex, England; a full sister to the famous prize heifer Potentella, and got by the famous Duke of Grafton. Portulacca was imported to this country when a yearling at a cost of \$1,500; sold to T. S. Cooper, of Pennsylvania, for \$1,000. Muirkirk Gwynne, a heavy roan heifer, three years old; she was got by Baron of Oxford, out of Masterpiece, and has four pure Bates crosses upon a Gwynne foundation; sold to Mr. John Huntington, of Cynthiana, Ky., for \$1,425. Water Nymph, a handsome roan heifer, with one Bates and four pure Booth crosses, got by Royal Briton, out of Water Lily; sold to Leslie Coombs, Cynthiana, Ky., for \$1,200.—*Philadelphia Trade Journal*.

ENORMOUS PRICES FOR VALUABLE STOCK.—There was a sale of short-horn cattle in Chicago last Thursday which excited great interest, attracting buyers from all parts of the country, and some from England and Canada. The herd sold comprised eighty head of short-horn bulls and cows, the property of Col. Wm. S. King of Minneapolis, Minn., whose stock farm has long been regarded as a model of its kind.

The Chicago Times gives a detailed account of the sales and purchasers, with the prices paid for each animal. Mr. James Wadsworth of Geneseo, in this State, bought some of the finest cows and heifers offered, paying \$4,000 for one heifer one and a half years old. The finest bull in the catalogue was bought by Mr. George R. Robbins, an Englishman, who paid \$14,000 for the second Duke of Hillhurst, a Duchess animal by the Sixth Duke of Geneva. He is less than three years old, is red and white, and is considered a model of bovine beauty.

There were in all fifty-nine cows sold, bringing an aggregate of \$102,370, making an average price of about \$1,735 each. There was not a cow nor heifer in the catalogue that sold for less than \$200, while some of them ran as high as \$5,500. A trio of Duchess heifers ranged from \$2,100 to \$4,400, while two heifers, less than two years old, and twins, realized \$11,000 from one gentleman. Afterwards, and while the sale was in progress, a telegram was received from a party in another State, offering \$15,000 for the same animals. Twenty-one bulls were sold for \$25,425, averaging nearly \$1,217 each. The total sum realized from this sale was \$126,795.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

—“Slimy looking things, 'aint they, boss?” says a butcher-boy attracted by an eely-looking fish on the stand in Fulton Market. “Rank pison,” chimes in a huckster. “look at all them nasty holes on his side.” Yet, the fish is a lamprey, and good to eat, if people only knew it, and would be brave enough to make a trial of them. They are caught now in plenty, but are so much waste food, and save to put up in bottles as specimens, have no use. It is strange how far prejudice goes back. Because Henry I. got a surfeit from over-eating lampreys at a feast, is that any reason why we should throw away what is a most delicious fish?

—The people of Rochester unite in singing the praises of Seth Green, who has succeeded by his efforts in propagation in reducing the price of shad in that city to the old standard of “sixpence per pound,” or fifty cents a pair. Three years ago shad were scarce at \$40 a hundred; now they are sold at \$10 per hundred. The fishermen along the Hudson, who ridiculed fish culture and opposed restrictions, are now beginning to give Seth the glory. Nevertheless, the dealers are not content with low prices and small profits. They desire to keep up prices. But Seth is determined that the public shall share the benefit of his efforts, and so he sends his agent through the streets each day to sell shad. Moreover, he contemplates supplying people in Syracuse, Utica and other cities in the State, if the market price does not come down in those places. Middlemen would sooner let the fish rot than bring down the market, and it is this which has led to the present plan.

—Rapidly are the efforts of the Fish Commissioners of different States developing into most gratifying results. Almost weekly we announce the appearance in our inland waters of the progeny of fish and spawn that have been recently planted. Last week it was the Alleghany; and now we herald the successful establishment of shad in the Upper Mississippi. Our informant, to whom we feel greatly indebted, is a naturalist and angler of repute, and we put much confidence in his conclusions. We quote from his letter:—

LAKE CITY, MINNESOTA, May 21, 1874.

EDITOR FOREST AND STREAM:—

All hail, *Alosa*! The first shad seen taken in the Upper Mississippi waters were discovered in Lake St. Croix last week. They were seen playing about a raft, and one jumped out and safely landed upon the raft! Wm. Morris, Esq., of Stillwater laid him upon paper and took his outlines and immediately forwarded the draught to me; I at once wrote to him for particulars. He writes that the shad has been sent to Seth Green, from whom we shall hear whether it is a true shad. The St. Paul papers state that it weighed five pounds. This must be a mistake, I think, from the outlines. I should judge it was a male. It is just seventeen-and-a-half inches long, four inches width and could not weigh over two pounds. He is, I think, a two-year-old, perhaps three. Parties are in pursuit of that school of shad, and I hope to give your readers further information soon. D. C. ESTES, M. D.

—We beg to acknowledge the courtesy extended to this journal by the Maryland Association for the Protection of Game and Fish, at its last meeting. This society is now fully organized with about 150 members, which include a great many very strong names, and we have no doubt will succeed in securing and enforcing proper laws for the State. The officers for the year are as follows:—President, General George S. Brown; First Vice President, Thomas Poultney; Second Vice President, Henry T. Wild; Treasurer, Robert Hodges; Secretary, B. W. Jenkins; Counsel, John Stewart; Executive Committee, P. P. Pendleton, R. B. Bayard, R. C. Thomas, C. D. Fisher, H. A. Rodewald, and D. C. Clark.

THE SECRET OF FISH CULTURE.

The following letter from Fred Mather to a correspondent contains not only the grand secret of success in fish culture, but is the key to the successful breeding of all other live stock:

HONEOYE FALLS, N. Y., May 18, 1874.

EDITOR FOREST AND STREAM:—

A spring running ten barrels an hour should be sufficient to grow many trout, enough for family use at least, although there are many other considerations besides flow. The largest springs in the State in some hands would not produce a single fish, and *per contra*. Hon. S. H. Ainsworth, the father of fish culture in America, got a stream which, in a dry time, will all pass through a cider faucet, from thirteen tile drains and has raised thousands of trout. Now, I can't do anything with bees; my neighbors can—secret: they like and attend to them. I

don't. But my fish are always on my mind, and if I take a spade to dig for any purpose, a box for worms goes with it, and more time is wasted in picking up those worms and then going and watching the “babies” eat them than perhaps might be thought profitable, *but the fish grow*.

There are failures in fish culture because so much depends upon the man who does it. I cited bees as an illustration. I hate them, and only love the 30 cents per pound that their honey brings (when I get any). I don't trouble them much and they don't bother me with too much honey. Bee men say that they should be often looked at, but they either don't get stung as I do, or else don't mind it as much. Some time a charge of powder will be put under them and honey will go up; but as I said, there are persons who make it a success, and because in my hands it is of no profit I would only appear ridiculous by asserting that the keeping won't pay. No business pays that a man has not interest enough in to attend to. A successful breeder of stock of any kind spends his spare time among them, as well as the time necessary to care for them; he likes to see them eat and grow, and his watchful eye will instantly detect anything wrong with them.

ROCHESTER, N. Y., May 18, 1874.

EDITOR FOREST AND STREAM:—

In answer to your inquiries how to keep goldfish, I will say that I am asked the question so many times it will save me much writing to publish a letter through the press.

Use any well, or creek, or river water that is not impregnated with mineral; change the water when the fish come to the top and stay there and breathe part water and part air. When you change the water take out nearly all, leaving enough for the fish to swim in, and fill the vessel with fresh water. Never take the fish in your hand. If the aquarium needs cleaning make a net of mosquito netting and take the fish out with it. There are many goldfish killed by handling. Keep your aquarium clean, so that the water looks as clear as crystal, and watch the fish, and in a little while you will find out whether your fish are all right. Feed them all they will eat and anything they will eat, worms, meat, fish, wafer, or fish spawn. Take great care that you take all that they do not eat out of the aquarium. Any decayed meat or vegetable in water has the same smell to fish in water that it does to you in air. If your goldfish die it is attributable, as a rule, to one of the three causes—handling, starvation, or bad water.

SETH GREEN.

NEW YORK, May 26, 1874.

EDITOR FOREST AND STREAM:—

I was glad to see Manhattan's communication in your paper of 14th inst., and hope it will have the effect intended. In your and other journals I daily read items, showing the attention which the Fishery Commissioners of other States are bestowing upon the subject of the introduction of salmon into rivers hitherto unfrequented by that most valuable of all fish; but all that our commissioners seem to be doing is to assert that our rivers are not fit for the experiment.

Now, Mr. Editor, I understand that the U. S. Government has some thing like two millions of Penobscot salmon eggs and fry ready for distribution to applicants, who seem to be plenty, coming even from Michigan—from every quarter in fact, except from our State. Why is it that our Fishery Commissioners are so strangely indifferent to this opportunity to create a new and valuable source of food supply? They seem, as far as their ideas are known at all, to have a decided notion that the Hudson is not a suitable river in its present condition of nets and dams for salmon. But many persons (as conversant as they with the peculiar adaptation of the upper Hudson for salmon, and better acquainted with the habits of that fish than any of the commissioners, by reason of many years' study of them in Canada, Scotland and Norway,) are sure that the half million salmon eggs and fry offered by Mr. Baird if placed in the smaller affluents of the Hudson, above Troy, would succeed finely. In time, especially if the experiment be followed up year after year by successive plantings, the North River might teem with salmon as now with shad.

The California salmon fry have been mostly distributed to persons and States, wiser and more appreciative than our commissioners, who are supposed to have accepted only 50,000 out of the three or four hundred thousand tendered to them. Shall New York State miss her chance of getting her quota of Penobscot salmon also? Cannot you, who appear to be so much interested in all that relates to fish and fishing, urge our commissioners to obtain and distribute our State's share of this national supply of salmon eggs and fry?

I see by their report of 1873 that our commissioners have on hand an unexpended balance of over \$20,000, out of appropriations of \$30,000 made by the State in 1872 and 1873. Wise economy is to be applauded; but is it wise to peddle out the State moneys in distributing predatory fish and neglect the opportunity of planting half a million of California salmon in the Hudson, and near as many more of the same fish from Maine?

With the more favorable disposition now prevalent among our legislators, and even net fishermen, towards protection, laws can doubtless be passed in time to secure the young salmon against nets and dams, when on their return from the sea two or three years hence.

My conviction of the importance of this matter urges me to write thus earnestly. I cannot think that the disinclination of our commissioners to attempt the experiment should be final. The expense will be small; the result, if successful, productive of many thousands of dollars annually. I hope you will publish this communication, for it represents the views of many fully conversant with the subject. SCOTIA.

[The Fish Commissioners of New York have a full appreciation of the salmon interest, and we think desire, by their action, to bring some pressure of public opinion upon the Legislature, so as to lead to the passage of laws for the construction of fishways for the salmon and shad to the spawning grounds. It would be too much to assume that they have no care for the interest of the State as far as salmon are concerned. The California salmon were very thoroughly attended to by them, a large supply being placed by Seth Green in the headwaters of the Hudson, Delaware and Susquehanna. It is true that no Penobscot salmon were accepted by New York; but we know that Prof. Baird regards the California fish the better of the two for the waters of New York. It will do no harm, however, to urge the introduction of the Maine salmon also. We shall be glad to see the work done.—ED.]

TRANSPLANTING AND TRANSPORTING LOBSTERS.—Our readers may not be aware that lobsters are included in the list of eastern fish to be taken if possible to the other coast, next month, in the California Aquarium Car. It is very difficult to keep lobsters alive, away from the ocean, long enough to survive the overland journey. With a view to reaching the most favorable results in this direction, Mr. Livingston Stone, of New Hampshire, has been trying some experiments, for the following memoranda of which we are indebted to F. W. Webber, Esq.:—

Experiments.—On Wednesday, the 15th day of April, 1874, thirteen live lobsters arrived at the Cold Spring Trout Ponds, Charlestown, N. H., and were divided into four lots as follows: Three lobsters were packed in a box among sponges, wet with sea water, and kept in a cold temperature with ice. Four lobsters having rubber bands on their claws to prevent their injuring each other, were packed in a similar manner and kept without ice at a warmer temperature. Three lobsters without bands on their claws were packed in the same way, and kept at a similar temperature. Three lobsters were packed among sponges, wet with a little artificial brine, made from coarse salt and spring water, and kept at a mild temperature.

The boxes all had large cracks* in them, through which the water from the sponges could easily run off, and was prevented from becoming stagnant in the bottom of the boxes.

RESULTS.—Of the three lobsters kept in the artificial brine one was found dead on Thursday morning, April 16th, one on Saturday morning, April 18th, and one lived till Monday morning, April 20th.

Of the four kept at a mild temperature, with the bands on their claws, in sponges wet with sea water, one was found dead on Saturday morning, April 18th, one on Saturday night, April 18th, one on Sunday night, April 19th, and one on Monday morning, April 20th.

Of the three which were kept in the sponges, wet with sea water, at a moderate temperature without bands on their claws, two were found dead on Tuesday evening, April 21st, and one lived till the evening of April 26th.

Of the three kept at a cold temperature among the sponges, moistened with sea water, one died Monday morning, April 20th, one died Wednesday morning, April 22d, one died Thursday morning, April 23d.

In all the above experiments the water in the sponges was renewed twice a day, ocean water being used throughout in the first three experiments and artificial brine in the last. It will be observed that the lobsters treated with artificial brine began to die first. Of those kept cold and treated with salt water, one lived seven days and one eight days. Of those treated with sea water and kept at a moderate temperature without ice, one lived eleven days.

On the arrival of these lobsters some of the spawn was taken from one, and packed away in sponges, wet with sea water, while wetting was renewed every day. On Tuesday, April 28th, a few of them were examined under a microscope, and the pulsations of the blood could be distinctly seen in the region of the little filament which connects the eggs.

—A Detroit correspondent, with some natural jealousy at our abbreviating one of his communications upon fishing, vents his displeasure upon the grayling in the following terse language:—

“The Michigan grayling, that you appropriate *columns* for, is little less than a very poor mixture of common perch and herring, but little game, a good biter at good bait, but mighty poor at fly.”

Thymallus won't like this!

—*La Chasse Illustrée* informs us that shad on the 30th of April were very plenty in Paris, and the markets were full of them. The shad in French is called *alose*, and some of our Philadelphia friends may remember that the old Swedes called it by the same name. It would be curious to know whence the word shad was derived. Will any of our readers, philologically inclined, give us the derivation?

The Kennel.

THE BREEDING KENNELS AT NEWTON NEW JERSEY.

WE paid a visit on Saturday last, by invitation, to the Kennels of Messrs. Waddell & Anderson, situated at Newton, N. J. On arriving at the depot we were driven to the Cockrane House, kept by the genial host, Mr. Ward, where we found assembled a goodly number of field sportsmen and field editors interested in the better method of improving the breed of field sportsmen's dogs, more especially, the clean limbed and highly educated pointer and the more mild and useful setter. Our official duties deterred us from taking the early train, so we arrived too late to partake of the friendly and elegantly arranged dinner given by the proprietors of the Kennels to their numerous guests. Our inner man was, however, carefully attended to by the excellent host, Mr. Ward, and the breeder, Mr. Waddell.

We noticed among the gentlemen present, “Gopher,” “Mohawk,” Mr. Morford, the editor of the *Register*, and the chief and field editors of the *Turf, Field and Farm*.

On inspecting the Kennels containing the all-aged pointers and setters, we noticed more particularly a setter called Dash, (there are too many Dash's, we shall all get confused by and by,) he is, we believe, by Putnam's Dan, his grand dam being an imported bitch of known good blood; color, nearly all black, with half tan spectacles, fair chest, loins and propelling powers rather weak, but would take a good prize on the show bench, and be difficult to beat in the field. There were also some fine specimens of the Red Irish, and one dog from the Duke of Bucleach's kennel, which looked like a fine ranger. The pointers were headed by a black blood-like powerful looking animal with a magnificent head, shoulders and hind quarters, also a young pointer bitch Dream, with a true clean head, a fine galloper, perhaps a little too delicate and mild in her disposition, but if well handled, would make a careful performer in the field.

Mr. Waddell has in this kennel some twenty all-aged pointers and setters, and of good blood, some of whose sires and dams have been noted for their ranging and staunchness. All were well broken and trained and noted field sportsman's dogs. We next visited the brood bitches and their whelps, two of which having a large family to take care of, were scarcely in a condition to show. How they will turn out depends on their ancestry and the handler. There was an orange and white setter, with marks of what was called many years ago the *English setter*; that was before the distinct strains became so popular and fashionable. We also saw a brace of beagles, a cocker and a hound, and altogether this kennel comprises some forty to fifty dogs, including whelps, &c.

Mr. Waddell has evidently spared no expense in erecting his kennel houses both in doors and out, and the system of breeding, which he is pursuing, is a good one, but we would suggest to him to confine himself to two or three noted strains, or breed a cross of his own. The out-door kennels

are very prettily and properly arranged on a hill-side, covering about an acre of ground which is sown with timothy and vetch; the night-quarters are arranged in stalls, loose boxes for the brood bitches, and everything connected with the kennels is clean, and the dogs are kept in proper order and control. Now that Mr. Foote of Morristown has given up his kennels, owing to indisposition, this kennel is undoubtedly the largest and best arranged in the country. Time prevented us from inspecting the dogs more minutely and we shall take great pleasure in paying Mr. Waddell another visit at the beginning of the woodcock season.

PEDIGREE OF MR. FOWLER'S DUKE.—Duke by Dash, by Dandy, out of Di; Dandy by Mr. Jobling's celebrated Dog, Dandy (of Lord Rosslyn's blood,) that took the 20 Guinea prize at Newcastle, out of Mr. Langstaff's Moll. Moll by Mr. Roddman's Pelter, out of Jobling's Nell. Nell out of Nell Dandy's dam out of Jobling's Lioness, by Sir William Ridley's Grouse.

Di, dam of Dan, bred by Captain Bruce, near Castle Dawn, Ireland, out of his Flirt. Flirt by Friday, out of Fan. Sire of Di, Marengo, out of a Gordon Setter Bitch, bred by Sir Arthur Chichester, by a son of the late Duke of Gordon's celebrated Dog Dandy.

Dandy and Di were purchased by Dr. J. H. Gautier of Mr. J. D. Kedward, Esely Court, Michel Curch, Esely, Hertford, England.

Kate, the dam of Duke, was bought when 11 months old; she is of the Stockton breed. Duke is really a fine specimen of the setter, a blood-like head, with the kind and mild expression of the Gordon, perhaps a little too heavy and the feet too large; he distinctly shows the marks of his hot-blooded ancestry, the Irish. He has four sons and two daughters by a white setter bitch, with black noses and eyes, and marks of symmetry; their colors are grades of chestnut red; one is orange and white; they would make good sportsmen's dogs.

For Forest and Stream.

THE WARWICKSHIRE FOX HOUNDS—VISIT TO THE KENNELS.

YESTERDAY afternoon I started from my hotel, and walking gently up the Parade, thronged at that hour with the beauty and fashion of Leamington, I made my way to the Kenilworth road, one of those wide avenues, lined with trees and pleasant villas, only to be seen here in England. A two miles' walk brought me into the open country, and on my right I saw a colony of brick buildings, some hundred yards from the road. They were the kennels of the Warwickshire hounds which I had come out to see. Striding down a lane cut between banks of red sandstone, I was first welcomed by a hound, a staid old lady who was evidently trusted with the run of the place. We fraternised and she accompanied me into the stable yard where I found several children at play, one of whom ran to inform the huntsman of the advent of a stranger. George Day, the huntsman soon appeared, and after handing him my card and letter of introduction, he proceeded to show me the place. I first inspected the kitchen, in one part was a great copper boiler full of oatmeal porridge, "pudding," as the huntsmen call it. The meal from which this is made is of the very best description, the same as sold for human consumption. When the oatmeal is thoroughly done it is ladled from the boiler into large troughs, where it cools down into a solid mass. In another room was a second boiler which was full of horse flesh. This is boiled from fifteen to twenty hours. In a third room the flesh and "pudding" is mixed together with cold water into one very savory mass. It is given to the hounds cold except in very sharp weather, when some warm broth is poured over it. About two carcasses a week are used at these kennels, and over twenty tons of oatmeal a year. Passing from the building we go to what interests me most, the kennels. The kennels are, in fact, a series of one story brick buildings, the size of stable, enclosed in a walled yard, with iron rails and spikes at top. There are two compartments, one for the dogs and one for the bitches, each having separate yards. As we enter through the yard door of the dog's kennel the hounds give tongue furiously at the sight of a stranger, but a crack or two from the huntsman's whip and a word or two of rebuke to the most turbulent and they are driven into the building, which we enter. At the height of about three feet from the floor a "bed" runs all along the building, leaving a gangway a yard wide on one side, to this the boards slope down. On this bed, which is covered with clean straw renewed daily, I see about twenty-five couples of hounds, and beauties they are. I am not a judge of fox hounds, and so cannot give the readers of FOREST AND STREAM any cunning description as to their points. But there was no mistaking, that white and black, or tan, or yellow, or liver colored, they were all beautiful animals. The huntsman called by name the crack hounds "Trueman," "Fairplay," "Pilot," "Foreman," "Childers," and one by one answering to their names the obedient animals came down and were inspected to the evident vexation of their companions left behind on the bed. Fox hounds I find vary greatly in England. A pack has to be bred to suit the country in which it is hunted, and masters of fox hounds continually interchange their puppies and breed from one another's packs. Some of the best hounds I saw here were bred from the pack of Lord Fitzhardinge, of Berkeley Castle, who is reported to have the best strain in England, although the district which he hunts is not a very good one. Others were bred from the Oakley pack, which hunts the Bedfordshire country. After I had examined the crack dogs, they were all let loose into the yard again, where they crowded around and fawned on me in rather an embarrassing manner. At my hotel there is about the best terrier in the world, which being *Scotch* is appropriately called "Mike," this animal is continually on my lap, and the foxhounds seeking evidences of Mike appeared to think I was some new kind of dog. But at a slight cut of the huntsman's whip, and a "Go back Hero," any over obtrusive hound would retire with his tail down, and a rebuked look. The cut of the whip could be nothing, but each hound seemed to feel the humiliation of being punished or rebuked. Their sensitive and intelligent expression is wonderful. Next we had a look at the bitches, about twenty-five couples, in the next kennel, and "Victory," "Lady," "Emma" and "Delicate" come in for a special commendation. Then to look at the puppies and their mammae. Some were in separate rooms in the build-

ings; others, with older families, had each a wooden kennel in the "paddock" adjoining; each kennel was corraled with a small wooden paling, leaving some yards of grass on which the puppies could play, and allowing the mothers to jump the fences, and leave their families safe when they wanted to pay visits. Some of the bitches I saw had fourteen pups, others twelve; the average number which lives is six to each bitch. The hounds are fed in the hunting season after their day's run; now they are fed the first thing in the morning. There is a long passage from the kennels in which the troughs of food are placed, the door of the kennel is opened and the huntsmen stands by it with his whip, and calls out one by one the name of each hound. Should one attempt to come without being called, he is dismissed with a cut of the whip to wait till the last. This the old hounds know, and it is astonishing how docile and patient they are. So many hounds feed at each trough, and when that is emptied, they receive their conge through an opposite door, and a fresh trough is brought for another batch of animals. In the day time they are exercised in the paddocks or along the roads.

I had a look at the stables, in which I found fourteen horses; they were well flagged and drained, as were the kennels and yards, and every convenience for equine comfort was there, but as I am going to pay a visit to Studley Castle, the seat of Mr. T. E. Walker, M. P., the well known sportsman, I will send you a description of his splendid stables.

The cost of keeping up a pack of foxhounds, it is hard to reckon. First, the hounds, next fourteen to twenty horses; wages to huntsman, first, second, and third whip; and a groom. Cost of stabling, and houses for men, and fields for horses. Altogether the total makes a considerable sum. A huntsman receives a very good salary, and he deserves it, as he is required to know all about hounds and horses, to be a first class rider and cunning in the ways of the fox.

The North Warwickshire is in the season hunted four, sometimes five days a week, which necessitates a large stud of horses being kept. It is certainly one of the best in England, and the proximity of Leamington as a pleasant headquarters for sportsmen makes it more popular. Within easy distance of Leamington are twelve packs of hounds, but the Warwickshire is of course the favorite. Many Americans have hunted with them. Col. Geo. E. Waring of Philadelphia, was here last fall, and Mr. C. A. Payson of New York and several others of our countrymen have hunted here all winter. Americans will not in England find a better pack than the Warwickshire, or a pleasanter sojourning place than Leamington. STANLEY JAMES.

Crown Hotel, Leamington, Eng., May 15, 1874.

MR. CARMAN'S THEORY.

NEW YORK, May 21, 1874.

EDITOR FOREST AND STREAM:—

I told you my snuff bitch is about six months old. She is nine. Having no sort of patience with the rambling zig-zags of a large proportion of the sportsmen with whom it has been my fate to mingle, I beg you to excuse the error of my thoughtless reply to your question as to her age. I have just read your comments, and cannot "agree to disagree" with you, because I agree with you so fully. I never advocated the crossing of setters and pointers as you put it; the experiment has been well tried I know, too, and as a rule failed. What I have been seeking and still seek is a breed of my own that, having for its fourth or fifth great grandfather a pointer, shall be permanent, and shall show in its markings and in some of its features that it is distinct, and yet preserve all of the finest characteristics of either ancestor. This experiment has not been tried that I can learn.

While, therefore, I agree with you that a crossing of the setter and pointer is unwise, as likely to produce valueless nondescripts (valueless expressly for further breeding purposes), and while I prize as highly, I hope, as you the absolute purity of either the setter or pointer blood, you should agree with me that even the possibility of producing a new and permanent variety of setter, differing sufficiently to constitute it a distinct variety, is not to be scorned.

Casting aside all pre-dispositions, he who thus seeks a new strain is creditably employed. My experience thus far in the matter has proven to me that several almost unfounded prejudices exist upon this subject. I am engaged in an experiment; "only this and nothing more," and I trust that you and I may live to see it consummated. "Tepper," the parent of my next trial, is deficient in some respects (carriage, e. g.) peculiar in some and splendid in others. E. S. C.

PREPARED DOG FOOD FOR SHOOTING EXCURSIONS.

EDITOR FOREST AND STREAM:—

Every sportsman has no doubt experienced great difficulty at times in obtaining proper food for his dogs while on a shooting excursion, especially if he finds it necessary to stop at some out-of-the-way place at a distance from the railroad where there is no hotel or public house. In a good game country one will not hesitate to take up his quarters at a farmhouse, rather than hunt a region overrun with shooters, and at such places it is next to an impossibility to find good diet for your four-footed companions, more so if you are shooting in company and there are two or more brace. Indian meal alone made into a mush would answer, but it is very difficult to obtain it old enough so as not to scold the dogs, which it will certainly do if it is not a year old. This quickly weakens them, and I have frequently seen them refuse it entirely, after it had acted upon them in this manner.

Setters and pointers, while being hunted, require the most nourishing and strengthening food to keep them in condition for the immense amount of work required of them. In England a condensed form of diet is manufactured and sold to sportsmen for their animals when in the shooting country; in fact, many feed them upon it at all seasons, and it is considered cheap and healthy. I do not know the receipt for making it, but should suppose any of our enterprising manufacturers of canned goods could readily obtain it and make an article of oat and cornmeal, strengthened and thickened with animal matter, that would not become stale or sour in any state of the weather. So that a sportsman, in visiting a region where it would be difficult to get proper provender for his dogs, might carry it with him or send it in advance by express.

In the London *Field* I have noticed the advertisement for Dog Cake or condensed food for the field, and it is a great wonder we cannot have it in this country, where it is needed, more especially on the prairies.

"HOMO."

—Dr. Charles P. Russel read on Tuesday evening last before the College of Physicians and Surgeons of New York, a most interesting paper on hydrophobia. The proportion of cases of rabies were stated by Dr. Russel to be about as follows:—671 in the spring, 580 in summer, 583 in autumn, and 573 in winter. During the past year there have been four deaths from hydrophobia in the city, and sixty-three in the United States. Dr. Russel spoke of the absurdity of muzzling dogs.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

W. G. B., Belleville, Ill.—Can you furnish vol. 1, bound, and at what price? Ans. Yes; at \$4.

ARCADE, St. Paul.—Have done our best to find the name of publishers. Have written to England about it. Will inform you later.

Bob, N. Y.—What constitutes the "English stroke," and how does it differ from any other? Ans. We will answer this in our next at length.

E. B. S., Syracuse.—Can you tell me if any other fish roe is used for bait except that of the salmon trout? Ans. Yes: all sorts of fish roe, and all sorts of things animate and inanimate.

W. A. M., Pittsburg.—Neither of Roosevelt's books can be had. Both are out of print. We obtained a few copies from the author, which we have disposed of.

F. W. C., Paterson, N. J.—Could not recommend to you any special dictionary for ornithological names. Think that Wood's work embraces the whole fauna as to classes and groupings; five volumes, and costs \$35.

A. E. S., St. Louis.—A player when he is on his ground can stop a ball after he has hit it, from twisting in on the wicket, with any part of his body except the hand. This is a correction, as we printed "with his bat only."

E. H.—Since you were good enough to recommend me Smithville and West Hampton as places suitable for general shooting, would you likewise inform me of the best way of reaching those places? Ans. Sag Harbor branch of Long Island Railroad.

S. S. K., Philadelphia.—Would it injure the shooting qualities of a 10-bore, 32-inch breech-loader (Scott) to be shortened to 29 inches? Ans. No. What would be the decrease in weight? Ans. ½ lbs. What is the best weight for all kinds of shooting with one gun? Ans. 8 lbs.

W. A. S., Jamaica.—In your number of April 9, "Wanderer" has a letter on the "Sneider Breech-loader." Can you inform me if the firm of Clark & Sneider have an agency in the city of New York and where located? Ans. They have not; write to Baltimore. See advertisement.

E. R.—For the Beaverkill take Midland R. R. to Westfield Flats; for the Walkill take the Walkill Valley R. R. to New Paltz. Marston, on Oswego R. R. is near good trout fishing. All the vicinity abounds in streams many of which will furnish good baskets. The Willememoc Club have a lodge near Marston.

CRICKET TYRO, St. Louis.—Has the bowler a right to order the batter at his end to stand between the creases, or may the batter at his option stand anywhere behind the bowling crease while the ball is being delivered? Ans. The bowler—see law XI—can oblige the batsman to stand on either side the wicket he chooses.

SHOOTIST, New Haven.—I have a setter pup six months old, who had an epileptic fit one day last week, and gave every symptom described in last number of FOREST AND STREAM in the article on Hydrophobia, by E. S. Carman. What can I do to prevent its occurring again, and if it should what remedy should I give him? Ans. Give him five Brandreth pills and a warm bath, decreasing the pills daily.

SUBSCRIBER, Buffalo.—Will you be so kind as to inform me through your valuable paper of some good point near Toronto, Ont., for a party to spend a few weeks and find good hunting and fishing during the months of September and October? Ans. Go to Barrie or Orillia on the Northern Railroad, which runs from Toronto to Collingwood. You are then convenient to Lake Simcoe, the Muskoka, and Cocochong lakes; splendid bass and trout fishing, fine hunting, &c.

CAMPER, N. J.—Where in New York can I buy a portable camp stove, also a Western dutch oven made of cast iron? Ans. Write to Pond & Dunklee, 87 Blackstone street, Boston. They make a specialty of sportsmen's hardware. What is the price of Cholmondeley Pennell's book and where can I get it? Ans. Scribner & Co., N. Y.; price \$3.50. For the other questions, click reel, \$4.50; line, 10 cents per yard; any kind of fly for club; grease your boots after wading and dry it in slowly.

RECREATION.—Is there any stream, or pond, or lake in which pickerel or trout can be caught, located at such a distance from New York City that by leaving New York in the morning and returning in the evening a day's fishing can be enjoyed by one whose spare time is too limited to permit his being absent more than one day? If so, where, and how can it be reached? Ans. On South Side Railroad, at South Oyster Bay, L. I., and on Hackensack branch of Erie Railroad at Pascack Station; also near Paterson, N. J.

OSCAR, Schaghticoke.—Would shrimp make a good bait for black bass in the Hudson north of Troy? Can they be kept alive for any length of time, if so, how? Where can they be purchased in New York; price per 100, and how pack for shipment? Ans. Never heard of shrimp being used for fresh water black bass fishing, though should suppose they would make a capital bait. They can be bought in the city markets for 25 cents per pint, and will live quite a long time in a box or pail filled with damp seaweed.

MANHATTAN.—Are the "860,000 young salmon to be put into Champlain" mentioned in your paper of 21st inst., *Salmo salar*, or salmon trout? 2. I desire to fish for trout in the lower part of a brook which is overflowed by salt water at high tide. What time of tide is most favorable? Ans. 1. An item copied; should suppose from circumstances of locality and ova on hand for distribution by the State, that the true salmon was meant. 2. In Long Island streams we fish from half flood to full slack, though trout are often caught on the ebb. The creeks are almost empty at low water.

E. F. H., Philadelphia.—Can you inform me if game for both shot gun and rifle is to be found in the same locality in Minnesota, or if we would be obliged to go to different sections of the State to satisfy our tastes? Ans. Deer and grouse are sometimes found together, but not always. The grouse are found in scrub oak or grass prairies. The grass prairies are dotted at intervals with thickets and motts of timber that afford shelter to the deer. In the Big Woods (a belt of timber some thirty miles wide that traverses the State,) game, excepting grouse, is found in variety.

A. T. M., Amherst, Mass.—Two of us have determined upon walking through the State of New York during our approaching vacation, yet have been unable to find any guide in the preparatory steps. Any information, therefore, which you could give us in regard to pedestrian outfits would be thankfully received? Ans. Any kind of light felt slouch hat, sedge color, twilled linen coat, vest and knickerbockers; a pair of broad-soled, wide, and short-heeled walking boots; those that lace up in front; undershirt of gauze merino; drawers, common muslin; socks, cotton; shirt to be made of flannel, self color with collar; castile soap. Duplicates, &c., to be carried in knapsack. A good thorn stick. Do not overload yourselves. Boats are out of the question, except perhaps the rubber boat, which we believe is not made in this country; it is inflated by blowing into it through tubes; the ribs and seat are cut from the woods anywhere.

—On Monday last Mr. Charles Reiche received a telegram announcing the safe arrival of his cavan at Alexandria, Egypt. The collection consisted of twenty-six giraffes, (the largest number of these animals perhaps ever brought together,) two elephants, twenty ostriches, four buffaloes, and a general assortment of smaller animals and birds.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch. 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, MAY 28, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, May 29th.—Maryland Jockey Club, Baltimore, Md.—Regatta at Savannah, Ga.—Scranton Driving Park Association, Penn.—Southern District Agricultural Society, California.

SATURDAY, May 30th.—Practice day of Harlem Boat Club, Harlem, N. Y.—Oswego Driving Park Association, N. Y.—Practice day at Hoboken Cricket Grounds, N. Y.—New Jersey Athletic Association, Ridgewood, New Jersey.

TUESDAY, June 2d.—Illinois State Sportsmen's Convention, Chicago, Ill.—Cambridge City Agricultural Association, Indiana—Freeport Driving Park, Ill.—Prospect Park trotting meeting, Brooklyn, N. Y.

WEDNESDAY, June 3d.—Match day St. George's Cricket Club, Hoboken, N. J.—Great Falls Association, N. H.—Cambridge City Agricultural Association, Ind.—Freeport Driving Park Association, Ill.—Lee Park Association, Wilkesbarre, Penn.—Prospect Park trotting meeting, Brooklyn, N. Y.—Harvard University Boat Club spring races.

THURSDAY, June 4th.—Lee Park Association, Wilkesbarre, Penn.—Prospect Park trotting meeting, Brooklyn, N. Y.—Great Falls Association, N. A.—Freeport Driving Park Association, Illinois.

—We have to acknowledge the receipt of the Sharpshooters' Score-book, published by Messrs. John P. Moore's Son, of New York. In a most handy shape will be found a series of admirable rules entitled, "suggestions for long range rifle practice," and a number of leaves with forms of targets, and blanks, with their appropriate printed headings, as of wind, atmosphere, &c., on which can be noted every variation, and the exact weights of bullet, of powder, and where the balls strike, so that a rifleman, with this book and a pencil, can absolutely map out the result of a day's shooting at Creedmoor. A record of this kind must tend to discover and correct errors, as it eliminates chance, and will be appreciated by all riflemen, whether at short or long range shooting, when elevations of the sights or a variation of the wind-gauge, have to experiment on. A collection of such memoranda arranged in just such a rational method as can be carried out by the use of the sharpshooters' score-book, will tend to blend theory with facts. We recommend the book most highly to all riflemen. Its use is both of a practical and scientific character. Its author, a well-known rifleman, has succeeded in producing one of the best score books we have seen.

—The Boston Journal whose presence among our exchanges is always most welcome, contains more news of interest to sportsmen than some papers which term themselves sporting papers. Its New England yachting and angling news is very full.

OCTOPUS EATERS.

WE had no idea that Mr. Tegetmeyer's notice that a correspondent of the FOREST AND STREAM had eaten octopus, would have brought forward so many corroborations of the fact that our decapod is capital food. From France, from the Island of Jersey, from the Mediterranean, from Naples and Venice, and from Mauritius, comes in an avalanche of testimony, written by gentlemen, most appreciative gourmands, all declaring the octopus to be a morsel "fit for a king." One correspondent, A. J., most kindly informs us how to cook them. "They may be stewed with butter, or fried in bread crumbs." In Venice, says Mr. Trevelyan, the octopus squid or cuttle fish is called *calamizo* (anglice, ink bottle), and as to its excellence he says: "Nothing I have ever eaten has come up to the delicacy of this fish." We beg to state, with all becoming modesty, however, that we have never eaten octopus ourselves, though we do hanker after it. Such glowing descriptions of the excellence of this creature have made our mouth water. We are sharp set for a bit of octopus. Will Mr. Harvey, of New Foundland, kindly send us a tentacle, say some sixty feet long, nicely potted in a tin can to experiment with? We should only be too glad to make the crucial experiment, and perhaps as lobsters are being exterminated, Mr. Seth Green could find in the octopus a substitute for the most cherished of shell fish. By the way, what an enormous waste of good food there is on this earth, and how much we have to learn, even from the Japanese or Chinese.

LATER.—We have eaten octopus!

Passing through Fulton Market we saw at Mr. Blackford's stand a nondescript creature. It was sprawling at full length on top of a silver-sided shad. By contrast, it was a clear piscine case of Beauty and the Beast. Such was its individual repulsiveness that we could readily understand how the fluent Victor Hugo with his vocabulary of 20,000 French words, should have spilt every syllable of them all out over it. A comely lady, purchasing a salmon at the fish stand, almost touched it with her plump white taper finger, and drew back shuddering, and said, "Horrid creature!" It had long filaments dangling Medusa-like around its head, a kind of animated crater, and then below were two wicked glaring eyes; and there was an adipose flabby body, and a long neck, which worked socket-like into the body. In fact, it was a baby octopus, an infant squid, a nursing Cephalopod, some two feet long. At our request Mr. Blackford gave us the pretty thing, and securing our prize, we took it to the office, and spent an hour dissecting it. The tentacles were provided with an infinite quantity of those curious suckers, and around the larger ones there was a distinct ring of clear shell as transparent as glass. We can readily understand how, as our intelligent correspondent F. E. E. informed us, when these arms and cups caught hold of you, they would cling like leeches. We found the ink sack, and with a drop or two of the fluid, managed to write some three lines, which are now—(some three or four days have elapsed since we wrote them)—as black as if inscribed with Indian ink. What we wanted to learn about was the beak. The description of the parrot-like beak of the octopus, is a perfect one. In the specimen under examination the upper part was about as large as the nail of the first finger. Sharp curved and cruel—the superior mandible fitted into the lower one like a pair of pincers. This beak struck us as if placed in the exact centre of the whole muscular power of the octopus; around it were flung the slippery arms, and in the middle, just where the tentacles flared out, this beak seemed whetted to tear the prey to pieces. It looked to us as a creation of strength, ferocity and greed. Ugly or not, we carried it home, and notwithstanding the admonition of the cook, "that it would just ruin the pot," we had the tentacles and a portion of the body cooked. A carefully prepared dressing was made, as for a lobster, and presently cold squid was on the table. In cooking, it assumed a pink color. Boldly, bravely, defiantly, we ate some. It tasted like poor lobster, somewhat leathery, requiring the most determined mastication. We must say we prefer soft crab to octopus. Now we, by no means, wish to put a damper on cephalopod eaters. Perhaps we did not know how to cook it. We have no doubt, however, that if wrecked on a desert island, ten thousand miles away from a bottle of Worcester sauce, we might manage to subsist quite well on octopus.

DECORATIONS FOR PISCICULTURISTS.—Here is a bit of news worth mentioning. Rejoice ye pisciculturists, your labors do not remain always unrequited! Queen Victoria, the first lady in christendom, in recognition of the services of James Youl, to whom is mainly due the introduction of salmon into the rivers of Tasmania, has made Mr. Youl a Knight of the Order of St. Michael and St. George. Now that we think of it, there are certain manly bosoms in the United States which might be set all ablaze, like the breast of an Austrian Marshal, with orders and decorations for services rendered to American pisciculture. Professor Baird might be invested with the blue and silver spangles of the *salmo quinnat*; Stone and Ainsworth should have the order of the *Pontinialis* in sparkling diamonds; Seth Green the decoration of the shad in Roes-colored ribbon; Mather the dorsal plume of a grayling; and Dr. Slack, well, we'll say the Ancient Order of the Octopus. Others we might decorate according to their merits, with mummies, pike-perch, and stickle-backs, in plain colors. For ourselves, we are modest—give us a grampus in aluminum, that would be plain but showy. Any slight recognition of our endeavors would suffice.

RULES FOR ARCHERY.

AT the request of numerous readers we have arranged a series of rules for this most charming recreation. We have consulted numerous authorities in regard to the regulations governing archery, and have been kindly assisted by a competent expert. We shall in time give the names of leading houses who can furnish all the materials required. We believe it is perfectly possible to reinstate archery in public favor, and we will be pleased to give a portion of our columns to reports of any archery meetings which may be forwarded to us. As very possibly many of our lady archers might not feel inclined to have their names published with the scores, we will use the initials when requested. But in all cases, the name of the club, the locality and address in full of the secretary of the club must be sent to us, in order to serve as vouchers for the authenticity of the match.

RULES FOR ARCHERY.

In archery theory avails but little, though a great deal may be advantageously learned by reading such works as have appeared on this subject. Like all athletic exercises there must be a certain amount of constant and painstaking practice devoted to archery in order to excel. A steady hand and eye, a correct appreciation of distance, a knowledge of the allowance requisite for the direction of the wind, and the parabolic curve described by every projectile in long distances, all these require considerable practice, and a zest for the object. All we would inculcate is, attention to the observations here laid down, and a determined endeavor to surmount the difficulties which necessarily accompany any new undertaking.

In the full persuasion that "Archery is an art difficult in nice performance," and of the inability of directions to impart proficiency, the following observations are addressed to the uninitiated, merely as suggestions with reference to the practice of that elegant and fashionable amusement.

Now as to bows. We would strongly advise any person desirous of purchasing a bow, to do so from a respectable house, where, with little chance of obtaining one of unseasoned wood, there is always a variety of prices and weights; for bows are measured by weight.

There are two descriptions of bows, termed "Self" and "Backed Bows," the former made from one piece of wood; the latter of two or more pieces joined longitudinally together. Bows of either description are nearly always made with the outside flat; this is called the *back*, while the inside, which is called the *belly*, is made round.

As regards the manufacture of the bow, when nearly finished it is strung and suspended by the handle at one end of a steelyard; the string is then drawn down to the length of twenty-eight inches for a gentleman's, and twenty-five inches for a lady's bow, and the weight of the bow is indicated at that point of the graduated scale where the *bob* (as the weight of a steelyard is called) balances; the number, which indicates the weight, is then stamped on the back of the bow. Ladies' bows range from twenty to thirty-two pounds, whilst gentlemen's from forty, sometimes exceed sixty pounds; but for the generality of gentlemen's, from forty-seven to fifty-two may be recommended; whilst for ladies one of twenty-five pounds will be found sufficiently strong to commence with.

No directions, however, can possibly be given on the choice of a bow, as it depends entirely on the strength of the purchaser, his height, and length of arm. It has been considered by some that the height of a man should be the length of his bow; this rule, however, will not hold good under all cases. A man under five feet nine inches ought not to use a bow longer than five feet ten inches, and we would not recommend one above six feet even for a person over six feet in height.

A bow too strong causes fatigue, and from the inability of the archer to draw the arrow up as far as is requisite, one too weak is to be rejected, as it may easily be overdrawn and broken, from no other cause than the application of too much strength. The proper weight, then, for the bow, is that which a person can draw somewhat easily, and without distortion of countenance or position. As he acquires skill in shooting, he will also find an acquisition of strength to the extent of several pounds weight.

With regard to stringing and unstringing the bow, there are innumerable rules and directions given, more or less complicated. The best plan is, for the novice to have it shown to him practically. It may, however, be here stated, that a gentleman's bow should be strung up six inches, and a lady's five inches and a half; that is, the string opposite the handle should be so far from the belly of the bow.

It is not necessary that a bow should be unstrung during shooting, when, from the company being numerous, some little time will probably elapse before the archer's turn to shoot arrives; but after the shooting is over it must be *unstrung*; and if wet, or even damp, should be wiped dry before it is put into the green baize case, which may be well protected from the ill effects of rain by India rubber or oil silk cover, made large enough to admit the bow and green baize bag easily.

A piece of ribbon is generally put through the hole in the extreme end of the upper horn; it is then passed through the eye of the bowstring and tied in a bow-knot. The object of this is to prevent the string from slipping down the upper limb of the bow when taking it out of the case, or from coming off the lower horn altogether, as in either case the string would untwist and receive injury. It is sometimes necessary to lengthen or shorten the string; previous to doing this the ribbon must be untied, and when the string is adjusted to the required length the ribbon brings it up to its proper place and keeps it there.

A new string requires lapping with silk to prevent the neck of the arrow from cutting the fibres of the hemp, or the string itself from being frayed by constantly striking the guard. Commence the operation by first stringing the bow, then rub with shoemaker's wax about six inches of the string opposite the handle; three pieces of stout netting silk of contrasting colors, about a yard in length, should be well waxed with beeswax; with a firm beginning, lap these three pieces of silk round the string, drawing each turn as tightly as you think the silk will bear. A piece of floss silk, about an inch in length, should be laid along the string opposite the top of the handle, and at each alternate round made to appear by being *held up*, and the silk lapped round the string *under* it. The lapping should be carried on about an inch and a half higher than opposite the top of the handle, and there fastened off. The part may be rubbed with some beeswax, and afterwards with a piece of leather;

the heat caused by the friction makes it both smooth and uniform. The entire string should occasionally be waxed and rubbed in this manner. The object in inserting the floss silk is, that there may be a distinguishing mark on which the arrow should be nocked. The best of strings will, at first, stretch a little; consequently, the different gradations on that part of the lapping where the floss silk appears, will point out exactly the proper place for the succeeding arrow when it has been ascertained from the flight of the previous one. The space of an inch will allow for any little alterations of the string.

The best strings are imported from Germany and Brussels, and it is good economy always to buy the best.

An archer should always have with him, when engaged in shooting, a spare string, previously lapped, and adjusted to the length of his bow.

(To be continued.)

IMPORTANT TO YACHTMEN.—The attention of owners of steam yachts is called to the importance of embodying in the new steamboat inspection laws some exemptions in favor of steam yachts and launches. As the law now stands, they are liable to severe penalties for not complying with requirements that neither their size or character render proper, and in the Southern States a number of small exploring and pleasure boats have been abandoned because of the oppressions of a law designed for large vessels, carrying for hire. An immediate effort will undoubtedly secure such amendments as will encourage the use of steam launches, and enable explorers and sportsmen to use them with a reasonable economy, and free them from needless legal red tape and embarrassment. For instance, the requirement that a boat, however small, must carry an engineer, captain, and pilot—no one man to hold two licenses, and these licenses costing \$10 each, and a good deal of trouble—is one that is unreasonable when applied to a small boat, where one man is competent to do all about the engine, and the owner can steer, taking his own risk now and then of getting on a sand bar. There is no real reason why a boat carrying no persons for hire should be under any more restrictions than a sail boat, in which people are permitted to drown themselves with the main sheet tied, and no licensed sailor on board. Sportsmen cannot carry so many men on small yachts and launches. There is neither need nor room for them, and it may be presumed that any person owning a craft of the kind will, for his own comfort and safety, exercise the same high degree of care and skill that distinguish sportsmen, yachtsmen, and horsemen in their guns, boats, and equipage. Hon. W. E. Lansing, M. C. of Madison and Oswego counties, is giving the matter thought and consideration, and other members should be called upon by persons interested.

SCHAHMYL'S RIFLE.—We had shown to us yesterday a very remarkable arm, said to have belonged to the famous Schahmyl, the Circassian Chief. It is a rifle some forty-six inches long in the barrel, the total length of the gun being four feet eight inches. The stock is the pistol form: the primitive shape used by Europeans some three hundred years ago, and still followed by the Chinese and Arabs. The muzzle of the piece you can almost turn your thumb in. The barrel is rifled. A peculiar flint lock, with a knob for a trigger, is in keeping with the general character of the piece. The stock is of handsome wood and is ornamented with ivory. The history of the arm is as follows:—Herr Otto Gropius, sent by the Emperor of Russia to superintend silk culture in the Caucasus, having been present at the surrender of Schahmyl, the fallen Chieftain, gave his rifle to Mr. Gropius, who brought it to the United States. This rifle should be highly prized by arm-collectors.

OUR SPECIAL REPRESENTATIVE IN ENGLAND.—We are pleased to inform our readers and the public that we have secured as our correspondent in England, Frank C. Pearce, Esq., the son of the celebrated "Idstone," whose letters and papers to the London *Field* and the author of the work on the "Dog," have been read with so much pleasure by all our American field sportsmen. We shall receive from Mr. Pearce a weekly letter touching upon the more important topics of the day and prominent events that take place in Great Britain, relating to the horse, the rifle, the shot gun, the dog, aquatic, and athletic pastimes, etc.

LAKE SUPERIOR AND THE NEPIGON.—In our advertising columns to-day will be found an announcement of the opening of Lake Superior navigation for the season. It contains information respecting the routes of travel and the chief points of interest to the tourist and angler, which we trust will save us the trouble of answering many questions respecting this wilderness paradise. The steamers are staunch and well provisioned, and the captains are courteous, and know their duty. We have tested three of them, and can testify. We know of several parties who are booked for the Nepigon.

BETWEEN FRENCH AND ENGLISH, OR THE CHASSEPOT AND THE SNIDER.—In April last, the *Volunteer Service Gazette* tells us, an impromptu match was made between some sailors of the French corvette *Indre*, and some of the Leith volunteers, ten men on a side. The distance was 200 yards, fifteen shots each, and the shooting was done in a fog. The French tars were nowhere—Leith team, 387; French team, 157. The worst shot among the Englishmen made thirty-two, while the best of the Frenchmen made only twenty-nine. The Chassepot, according to the English accounts, after a half dozen shots became clogged, with parts of the cartridge case remaining in the bore.

—Watermelons are now being shipped to the north from South Florida.

Sporting News from Abroad.

SPORT ANCIENT AND MODERN.

[From our Special Correspondent.]

Poor old Joe Manton! how he would stare if he was handed one of his own pairs of barrels neatly mounted as a snap action breech loader without a ramrod, without flint, and without steel!—How delighted would be Sir Lucius O'Trigger or other knights of the pistol, with self-cocking revolvers and those charming little Derringers in lieu of their flash-in-the-pan duelling irons. My old grandfather, they tell me, used to take out half a score of clumbers, and a man to work them in a green plush coat, and bring home two pheasants and a dozen woodcock, and think he had had a good day, while at the last battue his grandson saw 957 head, all told, laid out on the lawn at the close of the day without either surprise or satisfaction.

We have done with bear baiting for, good and all, and as to bull baiting, there is not at this present moment a bull in England artful enough to scrape a hole in the ground, to clap his nose so as to oppose no vulnerable part of his person to the sharp fangs of the Staffordshire brindled bull dogs. We no longer hear of babies being defrauded of their natural sustenance for the sake of favorite pups in a weakly condition, and badger tongs and man traps are included in the category of old iron. As a class, sportsmen in England are growing every day more refined and more humane. Mr. Freeman, anxious for notoriety, may rave about fox hunting, and spatter with mud the scarlet coats of the devotees of this time honored British sport, but as old Evans the huntsman once said, "The hounds like it, the horses like it, the men like it, and no one ever proved to me yet that the fox don't like it." Since Sampson, of Biblical repute, introduced it, it has flourished, and will continue to do so whilst princes of the royal blood ride to hounds, and ride well, too, and I had nearly said whilst there is a freeman in England. We have certainly not only revolutionized sport and guillotined barbarity, but we have also, in some respects, made it more scientific. Look at our ancestors' old portraits. I have one in my "sanctum" as I write. A tall, thin, spare old fellow he is, with a gun as long as himself, and quite as antiquated. I suspect "Egg" made it, but it is certainly not "new laid." His hat is what the demoiselles call "a Rousby," from the name of that pretty and fashionable actress, and it would look well in the present day over the chestnut plaits and well rouged cheeks of a Haymarket beauty, or with the stockings and breeches of a High Church dean. His coat is long fore and aft, and something between a southwester and a swell's dress garments, and as likely to be well ventilated by the brambles as my last silk handkerchief was which a country laundress hung out to dry on a furze bush. He has a young chatelaine full of seals hung at his fob, is all over shot pouches and powder horns, whilst his nether man comes out in top boots. Altogether, the "get up" is as peculiar as that of the Heathen Chinee, and, neither useful nor ornamental, calculated to stand hard wear, or to give that sporting appearance which French "chasseurs" are so fond of. Now we have discarded breeches and tops as out of place most anywhere, save over the smallest of knees and feet when in the saddle. Breech loaders and cartridges have superseded the cumbrous appendages of flasks and loading rods, and we haven't got to fumble with frozen fingers for a percussion cap, which won't go off when we get it. Yet I must not be too fast, for I see that at the last pigeon match at Notting Hill, in the optional sweepstakes for the cup, Viscount Stormont, Captain Digby Boycott, Captain Gist, and eight other gentlemen, not necessarily of the "old school," still stuck to the mediæval muzzle loader. But Captain Starkey won with a central fire, and Mr. S. E. Shirley, M. P., chairman of the Kennel Club, was third, having killed all his six birds in the first round. If pigeon shooting and battues are cruel, they are very mild compared to the cock fighting of fifty years ago. There may be reason in chiding at such an institution as the "Welsh Main," where the ties were fought off till one bird alone was left alive out of all the gallant black hearted reds and orange duckwings which hacked at one another's throats till their spurs were dyed in scarlet and their bodies riddled with stabs. The Cockpit Royal at St. James, in 1796, was an institution far better patronized, and boasting a more aristocratic attendance than the present British Museum, the Royal Academy, or the Countess of Derby's levees. Here all met on perfect equality. The peer shook hands with the jockey, and the gentleman of high degree laid his guineas against the dirty notes of the "fowl" breeders and horse copers. As Lord Henry Bentinck said about the turf, "on it and under it all men are equal," so in the cockpit the love of sport broke down the trammels of conventionality. The seats were arranged like those of an amphitheatre, with a "chaplet" of candles over the raised arena where the birds were pitted against one another. Hogarth's picture portrays the scene as only his master hand could do it. I have not an engraving by me, but well remember that the shadow of a man in a basket, who has been suspended to the ceiling for not paying his debts of honor, is cast on the floor of the pit. You cannot see him, but the shadowed hand holds out the shadow of a watch and chain, and you are left to conjecture by one of Hogarth's strange scintillations of wit that the prisoner, in his wicker cage, is offering his "ticker" as a last stake. There were two very celebrated game fowl men in those days—a certain Mr. Brookstank and a Mr. Oates. The latter owned a very noted black breasted bird named Mendoza, and the

former a red dun called Daredevil. Indeed, it was said in a doggerel couplet of the day—

Would Brookstank breed, and Oates but feed,
Thus forming true alliance,
At all the sod they'd laugh and nod,
And bid the world defiance.

There was a good deal of art in putting on a cock's spur properly, or, if required, improperly, for they had not much objected even then to "rope a horse" or "fight a cross." Unless the hollow silver "bayonet" was adjusted at the proper angle the bird might as well be padded, for he could not hit his antagonist, and was bound to lose. The unscrupulous knew this well, and used it to their own advantage. Sometimes the offensive weapons were of steel, but the wounds inflicted were supposed not to heal as readily as when made by the virgin metal. It is lucky that poultry shows have been invented, and though the chanticleer tribe now contend by display of form and plumage for the cups which they before won by pluck and strength, yet it is a good thing to keep up the breeds which were originated at nearly as much trouble, if not expense, as the ancestors of the English race horse.

In 1760 an attempt was actually made to introduce the hunting leopard, or cheetah, into England. Lord Pigot, at the instance of the Duke of Cumberland, turned out one of these beasts against an old red deer in Windsor Great Park. This sport smacks more of the cruel and sensual Indian Rajah than the European sportsman, and it didn't meet with much success. On the occasion I refer to it was a signal failure. It was the Ascot race week, and the novelty attracted a large crowd of spectators, amongst them being even some ladies of quality. A proper space was fenced in with strong netting about fifteen feet high by the road side, into which the old stag was turned, and shortly after the tiger was lead in, hoodwinked, by two black servants, and then set at liberty. He crawled towards the stag like a cat after a mouse, watching for an opportunity of safely seizing his prey. The stag was, however, too cautious and crafty to be had that way, and wisely and warily turned as he turned, placing his short brow antlers close to the ground, ready to give his strange antagonist as good as he sent. He in fact quite outgeneraled the tiger, who could only leap on a fine collection of keen spikes and points, and didn't seem to see it in that light. After a good deal of sparring, His Royal Highness, who was never noted either for forbearance or humanity, requested the niggers to urge the cowardly leopard on to the attack, evidently thinking it was time he saw a little claret uncorked. This they attempted to do, and succeeded so well that the tiger bolted over the palisade and "went for" the people, who, having no brow antlers, fled like doves from a hawk. The tiger was as much alarmed as they, and continued his headlong course till he came on a herd of harmless fallow deer, whereupon he sprang on an unfortunate straggler and brought it down. He was soon secured by his keepers and rehoodwinked, but I have not heard of any more of this Indian pastime, so I presume it died out.

As to the setters and pointers of our ancestors, there is indeed a change for the better. I do not believe they studied "backing" in the least, and they had but imperfect ideas of "pointing." In most pictures the dogs used for snipes, partridges, or pheasants, and even wild duck, are chump headed, bob tailed spaniels, who are rushing, open mouthed, at their game, and appear almost to catch it. As to hounds, we may have lost staunchness, but we have certainly gained in speed, both in horse and hound, since first

"A cry more tuneable
Was never halloed to nor cheered with horn."

Our horses' ears and tails we do not crop and dock as of yore, and though I still think that a spaniel's and fox terrier's stern should be shortened, and that bull terriers should have cut ears, yet in all other breeds I recognize the truth of the observation of the author of "The Dogs" when he says that "the Almighty never made his work for man to mend."

I see you rather assail the Scotch commission offices in an article in to-day's *FOREST AND STREAM*. I am no *habitué* of the race course, and I seldom if ever lay out more than a modest "fiver" on the Derby; still, though I am no gambler, I think you are hard on the commission agencies. The men who conduct them—Valentine & Wright, and George Crook, for instance—are as honest as the day, and their word and the word of most of our principal bookmakers may be taken for tens of thousands. They are a great deal straighter in settling up than many of the merchants and tradespeople of commercial life. Bookmaking on the turf is not really gambling at all. It is a tolerably safe and somewhat scientific pursuit, and nothing like stockbroking and other speculations. The men who gamble are the "plungers," who back horses to win. As Admiral Rous, the greatest authority on the horse, except, perhaps, Sir Joseph Hawley, says, "Racing would not last a year without betting."

Verily our legislature has put down real gambling—namely, card playing—with a strong hand. Where are now those pretty, innocent retreats of hawks and pigeons, where the lamps flared fiercely over the board of green cloth, and the gold, piled mountain high, as we see it in Frith's picture of "The Last Sunday," changed hands every minute as the fickle goddess waved her wand over red or black! Here or there, in some sequestered alley, still flourishes a solitary "silver hell," but the glories of the faro banks, where duchesses swindled dukes, and young nobles flung life and honor away at the cast of a die, have departed indeed. I do not suppose there is a sharper left in England capable of "eating a card," or performing the trick of "*sauter le roi*," for the light-fingered gentry are in

rag and tatters, and reduced to swindling country bumpkins out of half crowns at races, behind some friendly hedge, with the fascinations of the three card trick. "Almack's" has gone, and so has the Cocoon Tree, and, excepting the Argyle rooms, places "of distinction" are few where

"The giddy throng whirls madly round the floor,
Frilled skirts eclipse no longer rounded charms,
And wicked waists are clipped by clasping arms,
Cheeks rouged and chalked not wisely and not well,
Leave smudges on the shoulders of the swell."

A sporting gazette is now fit for a drawing-room table, and is not "hid under a bushel." In fact, most ladies read the *Field*, and even *Bell's Life*, and a dip into the *Sporting Magazine* doesn't reveal those painfully evident "doubles entendres" which constituted our forefathers' idea of wit.

IDSTONE, JR.

Civil and Military Club, Regent street, London.

Shot Gun and Rifle.

JUNE IS A CLOSE MONTH FOR GAME.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

GENERAL ADVICE FOR CREEDMOOR.

COMPILED FROM VARIOUS SOURCES.—CONCLUSION.

IN a former paper we gave some general ideas as to the necessary precautions to be taken by riflemen, and concluded by describing the position for off-hand shooting. We now approach rifle shooting at long ranges where any position is allowed. To describe the lying down position so as to make it perfectly clear to the uninitiated, is not so easy. It would be perhaps better for those desirous of acquiring it to go to Creedmoor and see the position for themselves. The lying down position is adopted by a majority of the most successful shots. It may appear somewhat constrained at first, but by a little practice you will overcome the difficulty. The following are the two methods of the lying down position: Lie down full length on your stomach, face to the ground, head towards and body in a line with the target and the rifle in the left hand. Curve the body considerably and allow the legs to move rather to the left, giving you an easier position and causing the otherwise prominent collar bone to disappear so that the recoil comes on the muscles of the right shoulder, which saves the punishment which would result from keeping the legs perfectly straight while using a rifle with a heavy recoil. Sometimes a small pad, as a pocket handkerchief, or small piece of sponge, may be placed under the coat just where the butt of the rifle comes and may soften the kick accompanying a heavy charge or a loose hold. An important point is to raise the head to a proper height, (as high as convenient,) for taking aim, placing the left elbow nearly under the rifle as a support. Be careful and do not place the left elbow too much to the left, for fear of a sprain on the wrist. The right elbow should be rather close to the body than otherwise. The natural tendency of the elbows, especially, when wide apart, is to gradually separate. This can be prevented by punching a small hole into the ground, with the heel of the boot and placing the elbow in it.

The second method of the lying down position is much harder to describe and takes a longer time to become familiar with than the first, but as some of the best shooting on record has been made from this position, it is worth particular mention. Lay on your back or rather on the right side, with the feet to the target. Cross the left leg over the right, and rest the right elbow on the ground. There is a peculiar feature in twisting the left arm round the neck, holding the butt of the rifle and giving support to the head. The rifle rests comfortably along the body. The butt of the rifle may be held with the left hand without twisting the arm round the neck, and the support of the head and neck may be obtained by holding on to the left coat sleeve with the teeth. This may not be as constrained or complicated as it seems to be, but we have thought it sometimes unfavorable for taking aim, as the head is held too far from the back sight.

Aiming requires good judgment and decision of character, for once the tumbler slips, reflection or wishing is all in vain. First get into a natural position, then bring the rifle to bear on the bullseye. (You must look at the target, not at the sights, when aligning the rifle;) think of the light and wind before pressing the trigger, then make sure of the sights being perpendicular, take a full breath and commence a steady pressure, and when satisfied that you can hold quite steady for a second or so longer apply the little extra pressure, the rifle goes off as if quite unexpected. After firing, continue to aim for a moment, as it is bad practice to jump immediately to see where the shot struck. Never fire without being satisfied with your aim, and if necessary, aim your rifle three and four times before shooting. Always get your sight as clear as possible and think where you aimed when making your last shot. Never pull the trigger while sighting, as you are liable to shoot to the right if you do.

Before and while you shoot, remember the following rules:—

1. Never point a gun, loaded or unloaded, at any person.
2. Never cock a rifle until you are going to shoot.
3. Be sure that the signal flag is not up, "if at Creedmoor," and don't shoot too soon after the last shot has been marked, as the splash from the bullets might hit the marker.

At Wimbledon prizes are taken from men who neglect

this rule, and they are not allowed to enter in any competition. A very strict but just rule.

During a match the competitor should devote himself entirely to the object in view. Keep from conversing with any one as far as possible, for the marksman may either forget or over-do something. Should your score be disputed, refer the matter to the proper authority; never give way to anger or disappointment, or even some supposed advantage of another competitor. Do not bother yourself how somebody else is shooting, for it might make you too anxious or too confident. A man who is constantly reckoning up his own score, will never do much. It is time lost and distracts the attention. Depend on your own judgment and observe the conduct of the marksmen who shoot before you instead of taking the advice of any one.

Never be in a hurry, as you will destroy your steadiness, and mistakes are almost sure to occur. Be as careful as you can of what you are doing, and as careless as possible of the doings of others, and pay no attention to "chaff or banter," as it is generally the sign that your adversary is getting frightened.

Keep cool and unruffled when you miss, and if beaten, do not pretend that you don't care, for what is worth competing for is worth winning.

BULL'S I.

CREEDMOOR.—The matches announced in our last, did not take place. However, as Saturday was practice day, some of the experts of the Amateur Rifle Club commenced work at long ranges. There were present, Messrs. Backer, Roux, Wingate, Gildersleeve, Fulton, Crouch, Conlin, Bruce, and some others. Distances shot at were 800, 900 and 1,000 yards. The practice was quite satisfactory, Col. Wingate's exceedingly so. We trust to see our men regularly at work at long ranges. Constant coaching is a necessity, if we want to hold our own with the Irish team.

REPORT OF THE NATIONAL RIFLE ASSOCIATION.—Just in good season, the report makes its appearance. Having ourselves some experience as to the difficulties and innumerable proof readings it requires to produce a careful report of rifle shooting, we are more than pleased with the general accuracy of the report. Many of the scores at the various matches having been given in detail in the *FOREST AND STREAM*, it is perhaps proper for us to state that the non continuance of their publication by us, was mainly due to our expecting that every day this report would be printed. Commencing with the first meeting of Jan. 13th of this year, the report contains a careful resumé of the work performed in 1873, with all the scores made during last year. One excellent portion of the report is that entitled "Suggestions," which shows how local rifle associations should organize, so as to act in connection with the National Rifle Association. As we are constantly in receipt of letters from all portions of the United States, requesting us to give parties information in regard to rifles, targets, and the rules governing the National Rifle Association, we advise our friends to procure a copy of the report, as they will find therein in a condensed form, every fact having to do with Creedmoor. We must again express ourselves as fully satisfied with the excellence of the report, and the general neat appearance of its get up. If the last report of the English National Rifle Association embraces some 300 and odd pages, it must be remembered that affiliated to Wimbledon, Canada, China, India, Japan, Mauritius, New Zealand and Ireland add their scores to increase its bulk. In our report then of some 104 pages, we have made an excellent start, and when in a year or so from now, we shall have rifle associations in every State in the Union, all we trust offsprings of Creedmoor, we may look for an encyclopedic tome as to size. We have before this expressed how much is really due to the patient care and labor the officers of the Association have devoted to rifle shooting in the United States. The success of the enterprise and the encouragement these gentlemen have met with, cannot be better understood, than by the production of just such an excellent report as we have had the pleasure of reverting to. We append the list of officers of the National Rifle Association:—

President, Col. W. C. Church; Vice President, Gen. Alex. Shaler; Secretary, Lt. Col. Henry A. Gildersleeve; Treasurer, Gen. M. T. McMahon.

Standing committees for 1874.

Executive Committee.—The officers of the Association are Gen. Woodward, Col. Wingate, Hon. D. W. Judd.

Finance Committee.—Gen. Ward, Hon. D. W. Judd, Gen. Molineaux.

Range Committee.—Fred. M. Peck Esq., Lt. Story, Capt. Casey.

—The match for the Boylan gold medal, shot for last week by the officers of the 12th Regiment, was won by Captain Smith of D. Company. The scores not having been reported we presume the shooting was not of the most brilliant character. Perhaps it was a match *en famille*, and not intended for public scrutiny.

—The rules of the range of the National Rifle Association for 1874, regulating the hiring of markers, applications for targets, duties of superintendents, cost of ammunition, &c., &c., have just been issued, and may be had on personal application at the office of the Association, No. 93 Nassau street, New York.

—The first regular match for the Long Range Badge, of the Amateur Rifle Club, will be held at Creedmoor, Saturday, May 30th, 1874, at 3 p. m. Open only to members of the Amateur Rifle Club, distance, 800, 900 and 1,000 yards; all the club to shoot at 800 and 900 yards, and the eight highest at 900, to shoot at 1,000 yards. Position, any,

(without artificial rest;) rounds, five at each distance, with privilege of two sighting shots.

RIFLE SHOOTING IN GERMANY AND SWITZERLAND.—Since last year rapid firing has been introduced at rifle contests in Germany. The target is an oblong of 105x150 centimetres, within this another oblong of 75x120 cm. is marked off, and the black centre is an oval 45x90 cm.; range 300 metres (1,050 feet). Centre-shots count three, middle field two, outer one. The target is unmasked on a given signal. As soon as it comes to view, the marksman on the stand commences loading and has three minutes firing time, at the expiration of which the target (a sliding one) is pulled down by the marker without warning. The marker now counts and shows the hits in each section of the target, while another marker has the number of shots fired. The greatest number of hits takes the prize, ties are decided by number of points. The first prize at the Leipzig shooting match of last year was won on a score of eight ones, eleven twos and fifteen threes, total thirty-four hits in forty shots fired in three minutes.

Though, by the statute of the Swiss National Rifle Association, the range for rifle contests is fixed at 1,000 feet, the shooting committee for the grand match to be held at St. Gallen from July 19th to 27th next, have arranged for targets at 1,000 feet, and others at 1,500 feet range, both classes to share equally in prizes. Instead of the oval generally used in Switzerland and Germany, the committee have again adopted a circular black centre. A considerable amount of prizes are expected, besides eight hundred cups to be won at the bullseye targets.

—In the *Galaxy* for June, there is a continuation of General Custer's admirable articles of his life on the plains. The gallant General has long been known for his skill with the rifle. When Santana was held in duranee, the General and Santana's son, had a series of rifle matches. The red skin was a capital shot, but the white man beat him all the time, to the great chagrin of the old chief. It seems Santana thought he had discovered the real obstacle to the success of his son, by ascribing superior qualities to General Custer's rifle as compared with the one used by the son of the chieftain. "Fairness on my part then required that I should offer the young warrior the use of my rifle, and that I should use his in the next match.... Greatly to my satisfaction," General Custer adds, "my good fortune enabled me to make a better score than did my opponent, and this result seemed to settle his opinion finally as to our relation." We have ourselves frequently seen contests of this kind between Indians and white hunters, and we never saw a match in which the Indians were not beaten. We cannot say, however, that on these occasions, chivalry was pushed far enough to exchange arms. Indians are frequently exceedingly well armed, and carry quite as good rifles as do white men.

—Our correspondent "Bison," at Fort Sill, Indian Territory, requests us to say that he is not in command at that post, as we stated in a recent number of this journal. Well, if he is not, he deserves to be in command somewhere. On the 16th instant he started on a two months' scout after Indians, leaving a half finished article intended for this paper, entitled, "The Comanches." We sincerely trust that his life may be spared, for if the Redskins should happen to finish him, he will never survive to finish "The Comanches." The following telegram to the Associated Press shows the kind of company and entertainment they have at Fort Sill:—

"The commanding officer at Fort Sill reports that Lone Wolf, the Kiowa chief, left the reservation on or about the 1st instant, with some forty warriors, to remove the remains and avenge the death of his son, killed last December in a fight with Lieut. Hudson. A large party of Comanches has left the reservation and gone south along the eastern borders of the Staked Plain, to attack the Indians at Fort Griffin, Texas; that they claimed to have taken enough warriors along to fight the troops at Griffin in case they should interfere. They stated that they were going to avenge themselves on the Tonkawas for the death of the Comanches killed in Col. Buell's fight last winter, in which a small party of Tonkawas took part. Lieut. Orleman, who brings this report, says that the Indians of the Fort Sill reservation came into that post a few days before he left to draw their annuity goods and rations. There were fully 3,000 Indians—Comanches, Kiowas, and Apaches—and their behavior was very insolent. Some of the young men strung their bows and pointed arrows at the sentinels. All of the warriors were excellently armed—a great many of them with new heavy rifles and carbines—and their stock was in very fine condition."

—A letter from Mr. Mowat, overseer of the Restigouche district in Canada, says:—

"Light snow here this winter has saved the remnant of our moose, as they are only killed in March and April on the crust; law is all right, only no person to put it in force. A moose inspector should be appointed for each northern county, 'a live one, mind you,' with power to choose his assistant and paid to scour the woods for two months, say \$150.00, if not, they will soon be a thing of the past. I believe our Kedgwick would be good for still hunting next September. If you would come, would almost promise to go a week with you."

—Our Memphis correspondent sends us the following score of an interesting pigeon match:—

The Bluff City Shooting Club of Memphis, Tenn., shot again last week for the challenge silver pitcher, 5 double birds each, 18 yards rise and 100 boundary, the winner to hold the pitcher six consecutive months, but subject to a challenge once a month from any member of the club. The first month it was won by P. H. Bryson, the second by R. W. Lightburne, third by D. D. Saunders and again the fourth month by R. W. Lightburne. The sport was most interesting, as the day was cloudy with a perfect gale from the south-west. When the pitcher was offered many of the

members thought it could be an easy thing for Dr. D. D. Saunders to walk off with it. The Doctor "sorter" felt that way himself. But unexpectedly several of the members are rapidly improving and will give the Doctor some hard tussles for the pitcher before he gets it. In fact our worthy President is about the man, who, I think, will carry it off; however, he won it this shoot. The score was as follows:—

R. W. Lightburne—11, 11, 11, 10, 10—8.
D. D. Saunders—10, 10, 11, 10, 11—7.
E. D. Wells—10, 01, 00, 11, 11—7.
J. W. Alley—11, 10, 10, 01, 10—6.
C. F. Leland—00, 10, 00, 11, 11—5.
P. H. Bryson—10, 11, 00, 11, 11—7.
D. Bryson—10, 11, 00, 11, 10—6.
J. E. France—00, 10, 00, 10, 00—2.
Judges—J. Cockull, T. R. Horsfull. Referee—Sam. Walker.

Several sweepstakes took place after the match for the pitcher as follows:—

3 double birds, 18 yards rise, 100 boundary; entrance, \$5; winner paying for birds.
P. Bryson—11, 10, 11—5.
D. D. Saunders—10, 11, 11—5.
D. Bryson—11, 10, 11—5.
A. Wheatly—00, 11, 11—4.
Sam. Walker—10, 11, 10—4.
R. W. Lightburne—11, 10, 10—4.

TIES—FIRST.

P. Bryson—10—1. | D. D. Saunders—10—1.

SECOND TIE.

P. Bryson—11—2. | D. D. Saunders—11—2.
D. Bryson—10.

THIRD TIE.

P. Bryson—10—1. | D. D. Saunders—10—1.

FOURTH TIE.

P. Bryson—10—1. | D. Saunders—10—1.

FIFTH TIE.

P. Bryson—10—1. | D. Saunders—10—1.

SIXTH TIE.

D. Saunders—11—2. | P. Bryson—10—1.

D. D. Saunders was declared the winner.

The remaining sweepstakes I am unable to report, on account of a rain storm coming up and blowing the scorer's papers away.

ARTHUR.

[In shooting off ties it is customary to place the shooters three yards further back, so as to avoid the excessive expense of birds.—ED.]

The following is the score of a pigeon match which came off at Waterloo station, last Saturday, just across the Long bridge at Washington, D. C.

Ferguson—1 1 0 1 0 1 0 1 0—5.
Benjamin—1 0 0 0 0 1 1 0 0 1—4.
Mills—0 1 1 1 1 1 1 1 1—9.
Mayhew—1 1 0 1 1 1 1 1 1—9.
Jensen—1 0 0 1 1 1 1 1 1—8.
Nokes—1 1 1 0 0 0 1 1 0 1—6.
Stevens—1 1 0 1 0 0 1 0 0 1—5.
Barker—0 1 0 1 0 0 1 1 0 0—4.
Williams—1 0 1 0 1 0 1 0 1 0—4.
Benjamin (Smith)—0 1 1 1 1 1 1 1 1 1—9.
Derrick—1 1 1 0 1 1 1 1 0 1—8.
Mills—1 1 1 1 1 1 1 0 1 1—9.
Ferguson—1 0 1 1 1 1 1 1 0 0—6.
Benjamin—0 1 1 0 0 1 0 1 1—5.

The ties were shot off on the 22d, with the following result:—

E. L. Mills—0 1 0 1 0 1 1 1 0—5.
L. E. Mayhew—1 1 1 0 1 0 1 1 1 1—8.
E. L. Mills—1 1 0 0 1 1 1 1 0 0—6.
G. D. Benjamin—1 1 0 0 1 0 0 1 0 0—4.

After which a sweepstakes at 5 birds, 21 yards rise, 80 yards bounds, the winner to pay all expenses out of the pool (i. e. \$20).

J. W. Stevens—0 1 1 1 0—3.
R. W. Barker—1 1 1 1 1—5.
Ed. Derrick—1 0 1 1 1—4.
L. E. Mayhew—1 1 0 1 1—4.
G. D. Benjamin—1 1 1 1 0—4.

—There was another shot for the Michigan State Medal on May 22d, at Detroit; 15 birds each, ground traps, 21 yards rise, 80 boundary, at wild birds. The following is the score:

Name.	Gun.	Straight.	Killed.
H. Hawkins.....	Abbey.	6	10
W. C. Colburn.....	Wesley-Richards	7	11
John E. Long.....	Long	5	12
J. V. Eldridge.....	W. W. Greener	4	8
E. H. Gilman.....	Scott	8	12
L. Horn.....	Scott	3	10
G. Stenton.....	Scott	5	11
E. Fisher.....	Scott	4	10
W. K. Cristy.....	Scott	4	9
H. W. Babcock.....	Green & Allen	7	10
W. J. Mason.....	Scott	4	Withdrawn
A. M. Van Duser.....	Mayer	3	Withdrawn
James Caniff.....	Long	6	13
L. Dubois.....	Scott	2	Withdrawn
J. Norvell.....	Scilling	7	10
J. Berger.....	Scott	2	Withdrawn

All central fire guns. Colburn holder of medal and Caniff the winner.

Two sweepstakes of 5 birds each; Long, winner.
The gun called Long was made for his use and sale, according to his directions while in Birmingham this winter. All here say it is the gun.

—The Central City Sportsmen's Club of Syracuse will have a shooting match with the Seneca Falls Club at Centerville, next week.

—The Illinois State Sportsmen's Association will hold their annual tournament on June 2d at Chicago on the Dexter Park grounds. On June 2d Gen. Webster will call the delegates to order and proceed to business. June 3rd, will be devoted to pigeon shooting. June 4th, the gun trial and bench show of dogs will take place. June 5th, the State Champion Pigeon Shot will be decided.

Our representative Mr. True will attend the convention and report to us all matters of interest to the sportsman.

—A mass convention of sportsmen of the State of Ohio, is to meet at Cleveland, June 9th, in the Kennard House Parlors, for the purpose of organizing a State Sportsmen's Association.

MONTGOMERY, Ala., May 18, 1874.

EDITOR FOREST AND STREAM:—

I send you the score of a shooting match held on the 16th by Montgomery Shooting Club; 7 birds each, 21 yards, 80 yards boundary. First prize, club cup, \$50; second value, \$5; third value, \$2.50.

H. B. Metcalf,	1 1 1 1 1 0 1—6	Winning third prize.
W. D. Brown,	0 0 0 1 0 0 1—2	
L. Wells,	1 1 1 1 1 1 1—7	Winning first prize.
H. C. Davidson,	1 1 0 0 1 0 1—4	6 shot off at 24 yds.
John Chisby,	1 1 0 1 1 1 1—5	Metcalf, 1 1 0—2
L. Tuttle,	1 1 1 1 1 0 0—5	Frazer, 1 1 0—2
B. Holt,	0 0 0 1 0 1 0—2	Crommelin, 1 1 1—3
J. P. Caffey,	1 0 0 1 1 1 1—5	Second tie, 27 yds
J. T. McDonald,	1 1 0 0 1 1 1—5	Metcalf, 1
D. Frazer,	0 1 1 1 1 1 1—6	Frazer, 0
John G. Crommelin,	1 1 0 1 1 0 1—5	
William Davidson,	1 0 1 0 0 1 1—4	
T. S. Doron,	0 1 1 1 1 0 1—5	
H. Crommelin,	1 1 1 1 0 1 1—6	Winning 2d prize.
John Gindrot Winter,	1 0 1 1 1 0 1—5	
George H. Todd,	0 1 0 1 0 1 0—3	

DETROIT, Mich., May 19, 1874.

EDITOR FOREST AND STREAM:—

Enclosed find score of "Amateur Club" for club medals, third shoot, won each time by present winner and now belonging to him. Baker, 10; Mather, 3; Phillips, 10; Harris, 8; Humphrey, 7; Howell, 9; Soullier, 8—15 birds, ground traps, 21 yards rise, 80 yards boundary, wild pigeons; ties, Baker, 3; Phillips, 2; 26 yards, 80 boundary.

The firm of which Baker is a member have a pigeon coop, one of the largest in the West. Only a few birds on hand at present. C. C. Cadman, 21 yards, 80 yards boundary, shot 36 out of 37 birds, in which were included five pairs double rises, and Harry Hawkins, conductor Mich. Central Railroad, who never shot from traps before, took 28 out of 31 both plunge traps, wild birds.

J. G. TRUE.

Sea and River Fishing.

FISH IN SEASON IN JUNE.

Salmon, <i>Salmo Salar</i> .	Salmon trout, <i>Salmo confinis</i> .
Trout, <i>Salmo fontinalis</i> .	Shad, <i>Alosa</i> .
Land-locked Salmon, <i>Salmo gloveri</i> .	Michigan Grayling, <i>Thymallus tricolor</i> .
Black Bass, <i>micropterus salmoides</i> .	<i>micropterus nigricans</i> .
Striped Bass, <i>Roccus lineatus</i> .	Sea trout, <i>Salmo marinus</i> .
Bluefish, <i>temnodon saltator</i> .	Weakfish.

—The anglers' halcyon days have come at last, and both salt water and fresh are alive with the finny tribes of all varieties. All our reports indicate a greater abundance of fish this year than for many years previous, and we hope that the long-threatened dearth of fish and fish food has been wholly averted by the repopulation of our rivers, lakes and estuaries. Weak fishing has been good at Barnegat for several days. Blue fish are holding back, owing to the cold weather. A school struck in on the 20th and left again on the 21st. They will soon be here. A letter from Dr. Kenworthy who extends a sweeping invitation to all readers of FOREST AND STREAM, to come to Barnegat, says:

"I have engaged Capt. Joel Ridgway, and if any of your friends should visit Barnegat, say to them that they had better secure the services of Jarvis or Joseph Ridgway. I shall keep daily notes of fish caught, with their weight and report results. From all that I can glean, I have reason to believe that Barnegat presents the finest opening on the coast for bass fishing. I have known over 2,000 lbs. of striped bass to be caught in one hour in surf, fish varying from 5 to 60 lbs."

Speaking of blue fishing, there seems to be as much of a disposition to test his game qualities with fly, as there is the shad's. An old angler, not unknown to many of our readers by his *nom de plume*, who spent last winter in Florida, experimented largely with light tackle and fly while there, and tried the blue fish too. In a brief note he kindly gives us the result. He says:

It was at Jupiter inlet, in February last. We fished from the beach, throwing against a high wind, and did not often get our flies out to the vicinity of the blue fish, but we had fine sport nevertheless. We landed many Cavalli and "Bone fish," and three blue fish of about seven pounds each in weight. We had many more blue fish booked, but lost them, sometimes from want of line to let them run and at other times we had our fish taken off by sharks before we could land them.

I think that if "Al Fresco" will try at Barnegat, Salmon tackle and fly he will become less enthusiastic about "squidding." Yours truly, B. HACKLE.

—There is first rate black fishing (tautog) on the Black Warrior wreck in Canarsie Bay. Some ten days since Capt. Davis, of Yatch Siren, E. H. Madison, and two of their friends, took seventy-eight there in two hours, and the fishing should be better now than then.

—All fish in season are in fair quantity in our markets. Some few mackerel are still caught in the immediate vicinity of New York, but the bulk of the fish are now coming from Massachusetts. King-fish from along the coast of Long Island and New Jersey are fine and plentiful. Shad continue in good supply and at reasonable figures, coming mostly from Connecticut. On Monday last a fair run of very prime shad were struck off Coney Island, and on the same day there was a remarkably good catch all along the North River as far up as Yonkers. These fish were finer, in fact, than have been seen for some years past. Salmon very scarce, and almost coming entirely from the Provinces. Worth retail sixty cents a pound. Sheephead have put in an appearance, and are coming in notable quantity from all along the coast, as far south as Virginia, and up to New Jersey. Welcome too are the blue-fish, which are now decorating the fish stands, having been caught off Barnegat. The halibut fleet are making large fares, and the vessels are bringing in from 200 to 300 of these fine fish each trip from the Georges. All hands declare that the halibut are finer than have been seen for the last five years. Bass rather scarce. The Potomac catch of thinking of fish has given out. What is in the market comes from the Connecticut River. The difference between a northern and southern bass, as to eating, is all in favor of the former. Trout very scarce, worth \$1. a pound.

—We were pleased to have a visit from O. M. Holmes, Esq., of Boston, a prominent and active member of the

Mass. Anglers Club. Mr. Holmes' visit had for its end and aim, LOBSTERS, as a paragraph in the FOREST AND STREAM had particularly called attention to the fact that lobsters coming from the eastward, far below the size allowed to be caught, were constantly exposed for sale in our market! We are glad to state, that Mr. Holmes, having called on the owners of smacks in the city, was assured by them, of their ignorance of the law, and that in future their captains would be instructed to let the small lobsters severely alone, and that they would all most cheerfully co-operate with the Mass. Anglers Association, in endeavoring to prevent the catching of lobsters below the limit of size allowed, which is ten and a half inches.

—The Newport *Mercury* says that cod fishing has never been so good at Block Island within the memory of the oldest inhabitant as it is at the present time. The fish boats get full hauls of these fish in less than half a day.

—The Chatham, (Mass.) *Monitor* tells how Capt. David Kent, was quietly engaged in fishing for cod the other day from his dory on the ground known as Pollock Rip, waiting patiently for a nibble, when suddenly without the smallest intimation of what was to happen, he felt his dory dart through the water at a miraculous rate of speed and with such velocity as to throw him off his balance to the bottom of the boat. He held on for dear life while the unseen power beneath the sea dragged him mercilessly forward as though urged by Neptune's pitch-fork in the hands of the briny sea-god himself. Matters beginning to look serious, he crept cautiously forward, fearful of overturning the boat, and with knife-in hand, cut the anchor rope by which the boat was drawn. Soon afterwards the spout of a whale explained to the astonished spectators the source of the motive power. A monster of this species had become entangled with the anchor and rope by which the dory was moored. The boat was carried about two hundred yards.

—The first salmon of the season made his appearance somewhat earlier than usual this year in the St. Croix River, Me. He was captured Tuesday morning, May 12th, in the weir of Mr. Luther Barber.

—The Hartford *Times* records the capture, the other day of the first good sized salmon taken in the Connecticut River in modern times, and hails it as the beginning of the fruits of stocking the upper waters. It was taken in Keeney's Cove two miles below Hartford, by Frank Smith of that city, and weighed six and a half pounds.

—The fishing season has opened in Lake Champlain, and those who now take occasion to "drop a line," are likely to take a very good catch of black bass, pike-perch, and pickerel, to say nothing of cusk, "and such."

—A letter from our correspondent at Meacham Lake (Adirondack district) dated May 21st, says:—

Our season is very late. The ice did not go out until May 13th, but the fishing begins to be very fine. We have two Brooklyn boys here who caught sixty-five trout yesterday. The salmon trout trolling will be in its prime next week. I caught three salmon-trout yesterday, the first of the season: they are in fine condition. I will send a small box of fish to Brooklyn soon, will try to show you how they look.

Fly-fishing will begin in about ten days. Then all those over anxious fishermen can work as hard as they please. The trout run large this season.

A. R. F.

—A party of three gentlemen, Messrs. C. E. Graves and J. W. Davis, Special Agents U. S. Treasury Department, Boston, and Geo. F. Leonard, U. S. Mail Agent of Vermont, returned from a short visit to Nova Scotia Monday morning with a splendid show of trout, to the quality of which one of our corps testifies; they captured upwards of 500, weighing from $\frac{1}{2}$ to $2\frac{1}{2}$ pounds each, all in the east branch of the Tusknet River, Yarmouth county. One of the party caught in the main stream a Salmon weighing 10 $\frac{1}{2}$ pounds. The small Salem fly with blue jay wings and the large Montreal fly were the most taking. They recommend anglers who want good fishing at a reasonable expense, to take the steamer Linda which leaves Boston Thursday noons for Yarmouth, N. S., and then by team to the river, where they may be almost certain of success. Good sport may be expected through the month of June.

—Our friend Maxfield, of Wyoming Co., Pennsylvania, says that a boy brought in a small string of *sixty* trout last week, but pleads that the fish don't bite very well yet! If those of our anglers who wish to go to Pennsylvania this season will take train for Lovelton, they will find Maxfield ready to post them upon some of the finest wilderness streams in the State. Maxfield is an old hunter who has knocked about that country for fifty years.

—"A clam at high water" is regarded as emblematic of perfect happiness, but when this symbolic clam is placed in juxtaposition with divine music, what a climax of supreme delight it may be supposed is attained! It is seldom that practical, plodding man aspires to this association of ideas, but when he does, it is easy to conceive the results that must follow. Clams and music! Ecstatic—robust—invigorating! It has been left to Mr. N. R. Waring, the proprietor of the Newark Valley Trout Ponds to combine the two, and it is advertised that on the 4th day of June next he will open his establishment with a "bank of clams" and a band of music. The grounds comprise six acres of land, containing thirteen ponds and twenty-four buildings and are located in the beautiful village of Newark Valley, ten miles north of Owego, and fifty-eight miles south of Auburn, on the line of the Southern Central Railroad.

We thankfully acknowledge season tickets from the proprietor.

—W. C. Prime is fly-fishing the Connecticut for shad,

—A letter from our Jacksonville, Florida, correspondent, dated May 19th, speaks of the fishing in the St. John's River as being exceptionally good. At Doctor's Lake, twenty-five miles above the city fresh water "trout" and drum are taken with a hook, while large quantities of mullets are netted. Down the river, in salt water, bass and sheephead are caught.

—Dr. J. H. Romeyn, of Keeseville, is at Bartlett's, Saranac Lake, this being his twenty-fifth season.

—The Rev. William C. Winslow left Boston on Monday, May 25th, for the Adirondacks, it being his sixteenth visit to that region.

—Black bass fishing has commenced in earnest on the Potomac. A letter from a frequent correspondent says:

WASHINGTON, May 20, 1874.

EDITOR FOREST AND STREAM:—

Every eligible rock that juts out into the current of the Little Falls of the Potomac River is occupied from earliest dawn until twilight by patient bass anglers. There is need of much patience, as the truth is the black bass have not yet come in any number in the lower part of what may be termed the Upper Potomac, although a local paper is full of the marvellous baskets filled. By the 24th we hope for good fishing. We use live bait exclusively. I have frequently fished with fly and spoon, but have never succeeded in taking one with either, although immediately afterwards and in the same spot I have caught numbers with minnows.

S. L. P.

—In the following letter our attentive correspondent S. C. Clarke, Esq., gives us some novel information respecting the coast fishing of Florida. The fishing, it seems to us, is of rather too heavy and miscellaneous a character to be pleasant, though it might have suited old Polyphemus, who used to "bob" for whales.

NEW SMYRNA, E. Florida, April 27, 1874.

I hear often from the natives of two large and valuable fishes of these waters, which, from their great size and activity, are seldom caught—the jew-fish and the tarpum. Yesterday one of the former was taken by a New York gentleman with rod and reel. It was a small specimen, weighing only eighteen pounds, but made a furious fight of 15 or 20 minutes. It seems to be a near relative of the grouper, and to belong, like it, to the perch family. It is a short, thick-set fish, with large fins, and looks like a giant black bass or a tautog; color, olive brown; scales small, head large, with well developed mouth and numerous small teeth. The first dorsal fin has 11 spines; second dorsal, soft; anal fin long, like the esocidae. When hooked it runs for a hole, like a grouper. Specimens have been taken in these waters on a shark line, which weighed two to three hundred pounds, so that I think it must be the larger of the percoids. The flesh is rich and well flavored, and as I have only seen this one specimen in four winters' fishing—here, I think it must be a rare fish.

The tarpum I have not seen. It also is rare, and is described to belong to the mackerel family, growing to the weight of 80 to 100 lbs. A surface fish, very active and strong, with brilliant silvery scales the size of a dollar. It is rarely taken with hook and line, as it generally carries away the tackle, however strong. It goes in schools and leaps from the water when struck, either with hook or spear. The only successful way of killing the tarpum, I am told, is to strike it with a harpoon, to which is attached by a strong line a small empty cask; the fish, by struggling with this buoy, exhausts itself so that it may be approached in a boat and killed with a lance. I lately hooked a mysterious fish or fishes (for the same thing happened to me three times within an hour) which ran out 50 or 60 yards of line with a single dash, and then breached on the surface, taking away my hooks. It was so strong and swift that in trying to check it a thumbstall of thick buckskin was cut through by the line as if by a knife, and my thumb burned by the friction. This was either a shovel-nosed shark, which runs off in this way, not turning like the common shark or a tarpum, and as a school of these fishes has been often seen near the spot where I hooked my fish, I am inclined to think it was this species which I then encountered. The rush was more like that of a fresh run salmon than of any other fish I know, except that this one did not leap out of the water like the salmon.

Not having access to any works on ichthyology, I am unable to give the scientific names of these fishes. They are mentioned under the above names by Captain Romans, who wrote a "Concise Natural History of Florida," about 1773. New York anglers who kill 30 or 40 lb. striped bass with the rod, would find in the jew-fish and tarpum foemen worthy of their steel.

The variety of species which one meets with in these waters in a few days' fishing, while it adds much to the variety and interest of the sport, causes a great loss of hooks and lines.

Perhaps you rig with small hooks for pigfish or whiting, and a redfish of twenty pounds takes away your hooks; or you are fishing with larger tackle, for redfish and a giant ray takes your hooks to the bottom and stays there, or a furious shark of 200 lbs. cuts off your line at the first turn he makes. I succeeded in capturing a Nurse shark five or six feet long, with rod and reel. This is a shark of rather sluggish habits (whence its name), *Somniosus brevipinna*, with teeth too small to allow it to cut off the line. After 15 or 20 minutes' play it was gaffed by our boatman.

S. C. CLARKE.

—A correspondent sends the following notes of salmon fishing in Ireland, which are by no means radiant or rubescent:

GLEN VAY., ABBEYLEX, QUEENS CO., Ireland,
May 13, 1874.

EDITOR FOREST AND STREAM:—

I have had no fishing yet. Have been out twice, but not a rise; plenty of fish in the river, but not a drop of rain for more than a month (I should say, more strictly speaking, a few April showers, lasting perhaps half an hour). The river is dreadfully low, clear and calm, and it would be a very guileful salmon that would take the fly with the hook, gut and line reflected over his very nose. I am much disappointed and pray for rain, as indeed do farmers and everyone else, for the crops are being burned out of the ground. Yours very sincerely,

W. H. POE.

SALMON FLIES.—*Fourth and Last Cast.*—"Great is Diana of the Ephesians," and great is, or was, Blacker of 54 Dean street, Soho, London. I don't know that he is alive now, but twenty years ago he published the most beautifully illustrated little book on fly-making, that angler ever cast eye on. The most delicate hooks, and the most gaudily and truly colored wings, and hackles; so airy and natural that where Blacker himself has not fastened them on, in his illustrations, you almost hold your breath for fear you may blow them away. And then his gold and silver twist or flat tinsel following the gay wrappings around the bodies of the salmon-flies—and all this on paper—is enough to set any one, collecting a fishing library crazy. If such a one has not "Blacker's Art of Fly-making," I can only say he ought to get it, if he can. But we are business men, (the editor and I,) and like the pills that Josh Billings advertises, "don't go fooling around, but attend strictly to business." So we will spend no more time with Mr. Blacker, but herewith present our plain untinted plate of four salmon flies. Some of the readers of this column may have seen them before. The only native amongst them is the second one from the top, of which I shall discourse by and

by. The others are copied, (honest) from "The Book of the Salmon." I introduce them to shew what are "feelers" and "toppings" and "loops" and "collars" and "heads and shoulders" and tags and so on. We scarcely ever use a more elaborate salmon fly than the second, for the waters of the Dominion, and a Shannon fly or one of Whitney's flies tied for the Maine waters, the "Toodlebug," for instance, or one of my own mixed wings made for the same waters, unless the river was very high, would scare all the Nipissiquit or Cascapedia or Restigouche salmon out of a pool. A knowledge of the technical names of the minor appurtenances of a salmon fly is not essential to one who plies his seventeen foot withe or scarcely to one who makes his own flies for American rivers, but to be thorough we must name all the little adjuncts and accessories.

I will therefore call the reader's close attention to the third figure. The tail is what is usually called a "topping," i. e. feather from the crest of the golden pheasant. The body is wrapped with floss silk, ribbed with gold twist, e. i. stout gold thread, which is followed by a hackle almost to the head where, as will be observed another feather is tied on, a blue jay, for what is termed a "shoulder." There is a mixed wing of golden pheasant neck, teal, guinea hen, and light brown turkey, with a topping much longer than the tail surmounting the wing. The head is of black ostrich herl, wound on closely, both for ornament and to hide the butt end of the wing where it is clipped off. Referring to the fourth figure, a "tag" just at the butt of the tail. A tag may be of ostrich herl, or pig's or seal's wool, or floss. The "feelers" which by a great stretch of imagination are supposed to represent the antennae of a natural fly—are the two long fibres of macaw tail feather tied in on each side of the head and extending back over the wings; and another stretch of imagination is to suppose that a natural fly carries them thus. The third or fourth fly figured is much too large for the rivers of Canada at an ordinary stage of water. The third might do on very high water after it has gone down just enough for the fish to commence noticing a fly.

The second figure is a very plain fly, the "Blue and brown," or "Nicholson," named after an old salmon fisher, "a broth of a boy," of St. Johns, New Brunswick. There are a few turns of flat gold tinsel, or gold twist, then a tail of mallard and golden pheasant's ruff; the body of reddish brown seal's or pig's wool, wrapped with a blue and reddish brown hackle; the wings are of mallard, and, according to Mr. Nicholson's style of tying, stand well up. The size of the hook given is for high water, when the dubbing and hackles are of lighter shades. As the water falls the hackles and dubbing should be darker. On low water and bright weather dark brown and purplish blue are best; the hook decreasing in size as the water falls. In fact, trout hooks numbers 3 and 4 (Conroy's O'Shaughnessy's numbers) are as a general rule large enough for the rivers of Canada; numbers 1 and 2 are full size for high water.

One who has become somewhat proficient in tying trout flies, can easily make one for salmon. But at the risk of repeating to some extent the directions given for the former, let me describe the tying of a plain salmon fly, and leave the ambitious amateur to his own ingenuity in making an elaborate one. The blue and brown, as described, has two hackles, one of each color. We will take a fly with one; say the Fiery brown.

Lay all the materials before you—a short topping for tail, a bit of gold twist (three inches or so), fiery brown dubbing of mohair or pig's or seal's wool, a hackle of redder shade than the dubbing, the wing ready folded, a plumelet of ostrich herl, a bit of blue and yellow macaw tail feather, and a gut loop. The latter is so cut that when doubled it will be long enough to come about where the tail is tied on, the ends to be beveled, and, bending it over a coarse needle or an awl, an eye should be formed, as is not represented in the illustration. The wings of a salmon fly, as a general rule,

should be double, or say two ply, for mallard, of which most wings are made, is very light, and requires delicate handling. In preparing it, stroke back the fibres gently and firmly until all their ends are square, clip off with your scissors, and lay it on the table; prepare another in the same way, and lay it on top of the first, placing it where it is not apt to be disturbed.

Now, if allowed, we will use the small vise figured in our first paper. *Firstly*—Secure the hook well between its jaws. *Secondly*—Wax your silk, and commencing near the bend, wrap up to the head with a dozen or so turns. *Thirdly*—Laying on the gut loop warp down opposite the bend, perhaps a few turns below. *Fourthly*—Lay on the gold twist, secure the end and winding it three or four turns back, opposite the point of the hook, fasten it, allowing the surplus to stand outward towards the head. *Fifthly*—Put on the topping for tail so that it curves handsomely upward and secure it with two turns of the wrapping silk. *Sixthly*—Fasten in the tip end of the hackle, the back uppermost. *Seventhly*—Having pulled and picked your dubbing and rolled it in the palm of your hand into a conical shape, (very little is required,) twist in the small end with your wrapping silk, and spinning both silk and dubbing almost up to the head, fasten with a half hitch. *Eighthly*—Twirling your vise, follow with four turns of the gold twist, fasten and then follow close behind with the hackle, the underside next to the dubbing. You are now ready to put on the wing. There are two ways—one is, after doubling it to tie it on as described; another (as taught me by Mr. Harry Venning,) is not to double but to lay it flat on the top of the hook with the fore finger and thumb of the right and compress it with the corresponding fingers of the left hand; bending the two edges of the wing so that an equal proportion will enfold the hook on both sides. Now with your wrapping silk take two turns; look to see that the wing is put on evenly and sets properly, and taking a half dozen more turns make it secure with a half hitch. Putting on the feelers to have them set uniformly is a nice job. The pair should be taken from opposite sides of the blue and yellow macaw-tail feather; that on the far side to be fastened in with two turns of the wrapping, then that on the near side. In making the head observe that the black ostrich herl has a convex and a concave side, and is to be wrapped on very closely with the convex side outward towards the eye of the loop. Clip of the surplus but-end of the herl and fasten with the invisible knot. With a small sharp stick dipped into copal, varnish the last wrapping of the silk, being careful not to let it touch the herl.

When mallard is scarce the under ply of the wing may be of turkey, making it more solid than if it was all mallard. As a rule salmon flies are wrapped, palmer fashion, that is, the hackle over the whole length of the body. The bodies, as will be observed, are very slender in proportion to the size of the fly.

THADDEUS NORRIS.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

—Though so short a time has elapsed since the issue of the Seawanaka yacht club's circular to the owners of schooner yachts belonging to recognized clubs, the committee has already received two formal entries for the Corinthian Cup—the Foam, Mr. Sheppard Homans, and the Idler, Rear Com. S. J. Colgate, and it is confidently expected that the list will be enlarged shortly by the addition of the Palmer, the Peerless, Clio, Agnes, Triton, and possibly one or two of our neighbors from Boston. The vessels regularly entered are expected to sail under the flag of some particular club, and be manned by members from that club, which will give an outside interest in the matter in addition to the personal feeling concerning individual yachts.

—The Union Regatta of the Boston and Dorchester Yacht Clubs took place last Thursday afternoon, notwithstanding the drenching rain, rough water, and chilling east wind. Careful preparations had been made for the occasion, and had the weather been auspicious, no doubt one of the finest regattas of the season would have been witnessed. The Dorchester fleet numbers seventy yachts, and that of the Boston Club half that number or more. The prevailing storm led many to suppose that the regatta would be postponed. Indeed, so general was the absenteeism that one class was not represented at all, namely: the first-class keel sloops, and in another, the second-class schooners, only one started, the Una May, and she did not return.

The distances were: for first-class schooners, twenty miles; second-class schooners, ten and a half miles; second-class keel, and second and third-class centre-board sloops, eight and a quarter miles; and fourth-class centre-boards, five and a half miles. The first-class schooners were sent off with a flying start, there being only two contestants, the Curlew and the Wivern. The following is a tabulated statement:

FIRST CLASS SCHOONERS.						
Name and owner	Return			Sailing Time		
	h	m	s	h	m	s
Curlew—S. L. French.....	6	24	20	3	59	20
Wivern—N. Wales.....	6	25	00	4	5	9

—The stoop Whistler, Captain Hawkes, has arrived from Fairhaven.

SCRUB RACE.—The first yacht race of the season came off, Wednesday, P. M. 20th, the rendezvous being at City Point, South Boston. The competitors were the Mabel of South Boston and the Lizzie of Lynn. The Mabel is a new boat, just launched, and is owned by Commodore J. N. Roberts of the South Boston Yacht Club. The Lizzie is owned by G. A. Taylor of the Lynn Yacht Club, and is three years old. Both are cat-rigged. The Mabel measures 19.2 on the water line, and Lizzie 19.6. The judges' yacht for the occasion was Commodore Roberts's schooner, Mercury. The Judges were Commodore George L. Babb of the Lynn Club, and Captains M. J. Kiley and A. Watts of the South Boston Club.

A flying start was given. The Mabel got off first at 2:41 P. M. and the Lizzie followed, thirty seconds later. The Mable having the lead in starting had less close-hauled sailing to do to round the first buoy, and got away from her competitor rapidly, having rounded the buoy and started her sheet. The Lizzie did not see an opportunity to make for this advantage, although when she got the wind abaft she gained somewhat on the Mabel. The Mabel returned at 4.18.50, and the Lizzie at 4.22.5, which, deducting thirty seconds for difference in the start, gave the race to the Mabel by two minutes and forty-five seconds. The race over, by invitation of Commodore Roberts, the participants in the race and the judges and members of the press took dinner at the Atlantic House.

—The schooner yacht Heron, Capt. C. P. Curtis, sloop yachts Maud, Vice Commodore E. C. Fuller; Bessie, Capt. W. Whitney; Ida, Capt. W. O. Holmes; Ruby, Capt. Prescott; Fire Fly, Capt. G. V. Balch, and Merlin, Capt. Saml. Gray, were among the principal boats launched at City Point, South Boston, during the week ending May 16th.

—The promising sloop yacht built by Pierce Brothers, City Point, South Boston, the past spring, has been purchased by Capt. A. C. Martin, of the Boston yacht club. She is to be named the "Pearl." If appearances do not belie her, she will prove to be a "pearl" among the fast ones of the fleet. She is 24 feet on deck, and 21-3 water line.

—Our regular Boston correspondent, "Binnacle," sends us the following items under date of the 18th instant:—

The Coquette, C. B. sloop, about thirty-four feet in length, has been entered in the Dorchester yacht club by her owner, Mr. F. P. Mosely. The Coquette is from "down east," and is reported as being a "flyer." She will come in the first class C. B.

The Falcon, schooner, Capt. Guild, is now at her moorings off Squantum.

The Mabel, of which mention was made in my last, has had a trial trip, and was found to be very stiff under sail; her hollow wooden mast proved itself capable of resisting any strain likely to be put upon it, having been tested in a reef breeze with whole sail.

Pierce Bros. are at work on a cat boat for a gentleman belonging to the Beverly club; it is being built to out-sail the Peri, which carried off all the laurels last year.

It is reported that the Dolphin, a boat in the style of the Ripple, has been improved so much in trim that it is expected she will carry off the honors in the fourth class C. B. Dorchester yacht club. She will have to sail very much faster than heretofore to "get away with" the Tulip, Rocket, and Bessie, of the same class, which have so far outsailed her.

The Tulip, probably the fastest boat in her class, has been fitted with a somewhat heavier mast than she has been carrying. Having "carried away" some half dozen sticks in the last two years her owner is going to practice economy in the future, feeling confident that the increased weight of mast and ballast will not damage the speed of his yacht.

A beautiful steam yacht was launched from Messrs. Benjamin Harrington & Son's manufactory, on Babb's wharf, on Tuesday. She is twenty-five feet eight inches long on deck, twenty feet keel, six and one half feet beam, and draws about ten feet of water. The yacht was built for Mr. John P. Adams, of Ipswich.

—Among the yachts launched at City Point, South Boston, during the week ending May 25th, are the sloops Gipsy, Captain Abbott; Bonita, Captain Atwood; Sea Bird, Captain Powell, and schooner Carrier Dove, Captain Barker.

—The steamer Starry Banner, Captain Taylor, of the South Boston Yacht Club, has gone into commission.

—Captain Ward's yacht Kittie, is in the hands of painters and riggers, and will soon be under sail.

—The secretary of the "Georgia Sportsman's Club" writes us from Savannah May 20th:—"The opening cruise of the yacht fleet under the auspices of the Georgia Regatta Association came off to-day at Montgomery. Our races will come off on the 28th and 29th instant.

—The Saratoga Rowing Association have made arrangements for the different crews of the intercollegiate regatta who will occupy during their stay the following residences and boat-houses:—Williams College will probably be located at Henry Moon's, and will soon arrive with three boats, where the Association will have its own boat-house. Yale College collegiates will occupy Myer's on the north-east shore and will number eighteen men and bring seven boats. Wesleyan College will be quartered at Abell's on the west shore north end of the lake; the crew will use Moon's ten pin alley as a boat-house and will have two boats. Rochester is at James Riley's on the west shore towards the south end; they will use the Ballston boat-house. Cornell University crews will lodge at Morgan & Ramsdell's on the west side of the lake just above the Schuyler Mansion and will bring five boats. Trinity will occupy Riley's residence. Dartmouth's place has not yet been assigned them. Columbia College crew will arrive on the 15th of June. Two prizes, one of \$150 and another of \$100, will be given by the ladies of Saratoga to the under graduate scullers who shall win the single scull race in the regatta week.

NEW ORLEANS, La., May 21, 1874.

EDITOR FOREST AND STREAM:—

There has been a revival in aquatics here, of which I presume you will be glad to know. The season was inaugurated by the St. John Rowing Club; at their new boat-house on the Bayou St. John, and the occasion was such as to merit the interest shown by the friends of the club in the pleasures of boating. The boat-house was hung with many colored flags and gay streamers, and I think the ladies must have lent a hand at the festoons of evergreens with which the galleries were decorated. The attendance of so many ladies was decidedly a compliment of which the boys may justly be proud. Not having a genius for describing toilettes I trust the fair sex will excuse the lack of mention of many tasteful and pretty ones I saw there. The first item on the programme was a race be-

tween the pair-oared, out-rigged boats. Lulu, colors blue; Thos. Toby, No. 1; F. E. Yulle, No. 2, stroke, Ben. Bridges, coxswain, and the Cora, L. D. Campbell, No. 1; Garrett Walker, No. 2, stroke; Ad. Hebbler, coxswain. This was a very nice race and was won prettily by the Lulu by about one length.

The next was a race against time in the four-oared, out-rigged gig. C. H. Slocomb, three miles with a turn. The club has no match for this boat, hence the race against time.

The next race was the Lightweight crew, colors red; No. 1. Henry Denegre; No. 2, John Glynn, Jr.; No. 3, Paul Robelot; No. 4, J. J. Haydel, stroke, and the British crew; No. 1, E. B. Musgrove; No. 2, G. P. Forwood; No. 3, J. C. Cannon; No. 4, Joseph Dixon, stroke. The Lightweight crew won in 20:58, like "good little men" as they are, 21:19 being the best effort of the British crew. Pending this was a race in single scull boats between Messrs. Day and Brown. Mr. Brown appears to have been overmatched, as Mr. Day had the best of the race from the start, and Brown was done to a turn, despite a gallant struggle on his part.

After the four-oared gig race was another set-to in single scull boats, between Messrs. Perkins and Kock. The former is an oarsman of much style, and evidently studies the "poetry of motion" much more than his own powers of endurance, for, despite a very bad sheer on the part of Mr. Kock at one of the turns, he drew away from his opponent, and at the finish led the "graceful" by three lengths. Then followed a review of the fleet by President Pike, and the exhibit was very creditable. As Captain Dixon's command—2 single scull, 2 pair-oar, 2 four-oared shells, 1 four-oared gig, 5 four-oared practice boats, and 1 six-oared barge—fired by the boat-house, every boat manned, the crew appropriately dressed, and altogether it was a very pretty sight. Then there was a grand aquatic promenade for the benefit of the ladies, after which "tripping on the light fantastic" was in order until the "wee sma hours."

I notice you have fallen into a slight error in regard to the Louisiana Rowing Association. There has been no dissolution of the association, the St. John being the only club withdrawing, leaving four clubs still represented, viz: The Pelican, Riverside, Orleans and Louisiana, all in a flourishing condition, and a regatta on the tapis for next September.

More anon, from

"FRICK."

CINCINNATI, May 23, 1874.

EDITOR FOREST AND STREAM:—

All quiet on the Ohio! Three races have been arranged but now all are off. One consolation is that there is a prospect for a three-mile pull between two well known amateurs of this city, but the conditions, &c., have not been satisfactorily completed. A new boat club has just been organized named "The Cincinnati Boating Club." Its officers are, president, Harry Crane; vice-president, W. R. Morehouse; secretary, Frank Walton; treasurer, N. G. Kenan; captain, J. P. Newman. A boat-house has already been purchased and the opening of the season here is looked for with anxiety. There is in this city a boat-house kept by the Schmidt Bros., at which boats of all kinds can be hired. Attached to it is a floating bath house. Both do big business in the summer season. It was probably at Schmidt's that the boating fever originated. The boat-house is built on an improved plan, which I may describe in a future letter. The only complaint heard now is that Schmidt doesn't bring out his boat-house ex-hibernis.

W. L.

The Horse and the Conyse.

—The spring meeting at Beacon Park, Boston, Mass., which was postponed from Thursday last, was continued on May 23d. The weather was charming and the attendance was very large. The first race was for a purse of \$400 for horses that had never beaten 2:29 mile heats, best three in five to harness. There were four starters, Sheppard Knapp, Jr., won the three last heats. Time—2:31, 2:30, 2:30. The second race was for a purse of \$250 for horses that had never beaten 2:34 mile heats to harness. Four horses started, Flora Belle won the three last heats. Time—2:32½, 2:30, 2:32.

—The Nashville Blood-horse Association, held the last day of the spring meeting at Nashville, Tenn., on May 23d. The attendance was large and the racing excellent. The first race was the Maxwell House stakes for three-year olds, two mile dash, \$50 entrance, half forfeit; there were sixteen entries and three starters. Vandalite was the favorite and won in 3:45. The second race was mile heats, for a purse of \$400, best three in five. Arizona won the three best heats in 1:46½, 1:49½, 1:51½. The third race was for a purse of \$200, mile heats, for all beaten horses. Madeira won the two last heats in 1:51½, 1:58½. Savory was ruled out for foul riding.

—The excitement at Prospect Park trotting grounds on Saturday last was that the great pacer Copperbottom and the wonderful trotter Lucillo Goldst were to contest for a purse of \$1,000 mile heats, best three in five under saddle. The attendance was immense and the track in splendid order for making fast time. The pacer was the favorite, but the famous mare was too much for him and won in three straight heats. Time—2:27½, 2:20, 2:21½.

FROM OUR SPECIAL CORRESPONDENT.

DETROIT, MICHIGAN, May 21st.

Chappell Bros. in "Petite La Cote," Canada, have one of the best stables in the west; amongst the horses I noticed Jim Connor, by Lightning, entered for the Buffalo races this season; also Gen. Custer who won eleven straight races in Canada last season, and made the best two mile race in Canada; also War Dance whose pedigree dates back to a mare that belonged to Charles the II., 1689. At Capt. John Demas' stables at Hamtramck, the best stable in Michigan, can be found Membrino Gift, Black Stalion, entered at Boston for the championship race of \$10,000 and gold medals; mare Mollie, seven years old, who trotted a 7th heat in 30½, Western Boy trotted in 27; Belle, Susy and Diamond and others. The Captain says he will bet a thousand dollars he captures one of the medals. He will start about the first of June, through this State, Illinois, Indiana, Ohio, New York, Springfield, and Boston. A day or two since we took a steamer and went to the Club House on St. Clair Flats, had "much" sport in spearing pike, both in day time and at night. Too early for pickerel, bass, &c., but saw a few. The cricket club members are "in practice" to play at London, Canada, 25th of this month.

There is a boat club just started. Mr. Barker, tobacco merchant, has just purchased a new yacht, said to be the finest in the west. Mr. Long, Mr. Cadman and others have given me letters all over the State, and have vied with each other in doing me honor for the paper. I am to visit yet, Audubon Club rooms, also the cricket rooms. I shall be in Chicago on the first of June at the tournament, any way.

New Publications.

FAST LIFE ON THE MODERN HIGHWAY. Being a glance into the railroad from a new point of view. By Joseph Taylor. New York. Harper & Bros.

It needs only a glance into this unique volume of numerous variety of story and facts to assure one that it was written by one perfectly at home upon the rail. It is written in an off-hand, sensible manner, graphic, lively and interesting. It tells of many facts very necessary to be known by the travelling public, never before told. We can pardon our railroad man, the conductor, brakeman or superintendent for blowing his own trumpet a bit, as he tells us all about railroads and railroad men. He knows a model conductor from a snob or a churl, and what he says constitutes a good conductor has the ring of the true metal. The book is worth its price for the stories alone it contains. It will "sell" on the railroads we have no doubt.

THE LAND OF THE WHITE ELEPHANT. By Frank Vincent, Jr. New York. Harper & Bros. 8vo, pp. 316.

We gave an announcement of this highly interesting work some few weeks since, and having had a fuller examination of it we consider it a rare work, every way deserving the attention of the reading public. What gives a greater charm to the "White Elephant" over many other books of travel, is the comparative lack of knowledge about southwestern Asia. It is still to many like a book sealed with seven seals, and this heretofore unknown realm until visited by the author, was simply called the land of the "unexplored." Once in a while a gleam of intelligence comes to us concerning this wonderful land, just sufficient to increase our desire to know more of its marvels. We find the work exceedingly attractive, possessing a fascination with the opening page which leaves us not until we come to the end. The descriptions of social life among the Siamese is placed before us in a manner never before attempted by any other author; the peculiar manners and curious tastes of these oriental barbarians will be found very interesting and highly instructive. The book is full of wonderful revelations by sea and land, and is very appropriately entitled "Stories of the Land of the White Elephant."

Popular Science Monthly. June.

Contains twelve papers, literary notices, miscellany and much matter of great interest to the scientist and student. This number is particularly rich in a forcibly written paper by Andrew D. White, LL.D. upon scientific and industrial education in the United States. This paper will attract much attention at the present time, as men who love their fellows seem to have become fully aware that something must be done in the direction of the popular thought so plainly set forth in this paper. The solution of the question, What is this new education sought? is, we trust, soon to be thoroughly discussed by the leading minds of Europe and America. A just answer in due time will be given.

From same publishers, New York, J. B. Ford & Co., we have received "Pleasant Talk about Fruits, Flowers and Farming," by Henry Ward Beecher. This is a new edition, with many new facts and anecdotes from recent writings upon these subjects not before published. Many of these fragmentary sketches were written some twenty years ago and published in the agricultural papers of the day. The character of these sketches is, nevertheless, such as will keep, and the information here given is such as will be found of great value to every one who owns only a small piece of ground. Mr. Beecher's "Talk about Flowers" is as fresh and glowing to-day as it was the day it was written, and this book should be owned and carefully studied by every one who loves either products of the kitchen garden or the floral department which embellishes our gardens.

SEVEN DAUGHTERS. By Armand M. Douglass. Boston. Lee & Shepard.

This is a story of girls for gents to read, and we presume it will find many female readers, for who ever saw a true daughter of Eve who did not possess some of her mother's curiosity? It will be amply gratified in the perusal of this fanciful delineation of the lives of the seven daughters of a country curate, who all in due time fell in love after the most approved fashion with seven proper young men of the village. How this interesting love tale closes you will find in the book, in which there is much to be pleased with, much genuine humor, added to a strong individuality of character. Miss Douglass, however, we feel sure, can write a better book.

LIFE UNDER GLASS. By George A. Shove. Boston. Osgood & Co.

This is a sort of new revelation, promulgated by the author in a very sanguine, hopeful mood. He proposes to cure many of the ills of humanity by the substitution of an artificial climate "under glass," a sort of miniature Cuba, Havana, or a small slice of the Floridas. He is modest in his request; why not give him what he asks? Forty acres near Boston to experiment upon? It would pay cash if it did not heal human maladies. His book is a very readable one.

THE LITTLE CLASSICS. Osgood & Co. have in press and in a forward state of preparation a very interesting series of amusing and instructive works under the title of "Little Classics," which will be in form of handy little volumes of pleasant readings for the home, the railway, or any other location. Just the size to put into the reticule or pocket. They will comprise twelve volumes and "The Exile" will be the title of the first volume. From what we know of this series we can promise our readers a rich treat, a valuable collection of books that are very interesting, amusing and desirable.

ANNOUNCEMENTS.

Estes & Lauriat have in press "Elena," an Italian story by L. N. Comyn. "Woman's Love; or, Like and Unlike," by J. H. Smith. "Waiting and Hoping," a new novel from the French of Andrew Loco, "Men of the Mayflower, and other lectures" by W. M. Puncheon, and a new and very elegant edition of Victor Hugo's "Tour on the Rhine."

Boston—Lee & Shepard. "Life of Hon. Charles Sumner." This house will soon issue, uniform with the complete works, in nine volumes, the "Life of Hon. Charles Sumner." The nine volumes already published were edited by Mr. Sumner himself, and we are happy to announce that the copy for the remaining volume is now in the hands of the printer.

Philadelphia—J. B. Lippincott & Co. "The Border Land of Science." By A. Proctor, B. A. 438 pp., 8vo, price \$4. This full and valuable synopsis of essays was formerly published in the *Cornhill Magazine*. It will be found a valuable addition to modern science.

New York—Scribner, Armstrong & Co. "The Structure of Animal Life." By Louis Agassiz. 128 pp., 8vo, price \$1.50. This book is full of interesting facts, and will be found fully in accordance with the theological opinions of the times.

—Our thanks are due to C. C. Francklyn, Esq., of the Cunard line, and to Mr. White, Superintendent of the American Express Company, for favors in regard to shipment of the eggs of the pinnated grouse to England.

—Mr. J. H. Batty, (Taxidermist,) will soon leave New York for the Rocky Mountains collecting specimens of Natural History, and does not wish to have any of his customers send him specimens for mounting during his absence, from June 1st to November.

—A young lady who witnessed a ball match between the Ohio and Zephyr clubs thinks it quite natural that the Zephyrs should be "worsted."—*Critic*.

There are no such clubs. The whole thing is a yarn in order to be funny.—*The Capitol*.

Yes; and a crewel imposition.—*Forest and Stream*.

FOREST AND STREAM
A Weekly Journal,DEVOTED TO
Out-Door SportsHunting, Fishing, Yachting, Boating, Practical Nat-
ural History, Fish Culture, &c. &c.
It is the OFFICIAL ORGAN of theFISH CULTURISTS' ASSOCIATION
OF AMERICA.The Publishers of FOREST AND STREAM
In order to stimulate the development of

MANLY and ATHLETIC EXERCISES,

AS OF
FISHING, SHOOTING, ARCHERY, CRICKET,
FOOTBALL, and CROQUET.Offer the following prizes for clubs of three or more
Single Subscription per Annum \$5Starting Clubs.—Agents, and others interested, are
advised that we do not insist upon their starting with
full clubs to secure our rates. They can send three
or more at a time, and on forwarding the requisite
number within 60 days will be entitled to same premi-
ums as if all were sent together.

CRICKET.

For \$20 00 four copies, one year, with one best
spring bat, one College bat, one Dark cricket ball;
price \$7 50.For \$25 00, five copies, one year, with a complete
cricket set; one College bat, one polished bat, Clap-
shaw; one Dark cricket ball; one set of stumps; price
\$12 00.

FOOTBALL.

For \$15 00, three copies, one year, with one Rugby
football; price \$6 00.

FISHING RODS.

For \$15 00, three copies, one year, with one superior
four joint light rod, suitable for all kinds of fishing;
price \$7 00.For \$60 00, twelve copies, one elegant rod; suit-
able for trout, black bass with fly, or for trolling bass
or pickerel; as fine a rod as can be made; German
silver tipped, with three tips; price \$25 00.

CROQUET.

For \$20 00, four copies, one year, with very hand-
some set of croquet; price \$7 00.For \$25 00, five copies, one year, with superb set of
croquet; price \$10 00.For \$30 00, six copies, one year, with the finest set
of croquet made; price \$14 00.

REMINGTON RIFLE AND SHOT GUN.

For \$75 00, fifteen copies, one year, with one Rem-
ington Deer rifle; price \$28 00.For \$100, twenty copies, one year, with one Target
rifle, 30-inch octagonal barrel, to be used for sporting,
hunting, or target shooting; price \$26 00.For \$100, twenty copies, one year, with one Rem-
ington double barreled, breech-loading shot-gun,
one of the best guns ever offered to American

REMINGTON'S CHALLENGE

Long Range, Breech Loading,

TARGET RIFLE.

Weight, 10 lbs.
Length of barrel, 34 inches.
Calibre, .44-100 in.

Pistol-grip Stock, Fine Walnut.
Oil Finished. Checked Grip. Case-
hardened mounting.

The following discs for front sights.

Open bead Bar and Slit. Bar & Open Bead.

FRONT SIGHT.

The above rifle was the winner of all the prizes for accurate shooting at Creedmoor at the last spring meet-
ing. 102 out of 123 at the fall meeting. "Turf, Field and Farm" Badge, 3 out of 4 times. Amateur Rifle Club
Badge (final). Diamond Badge, first and only time. For authentic record of above see N. R. A. First Annual
Report, just out. At the match Saturday, 16th inst., 7 Remington and 7 other rifles were used, resulting in a
score of 302 for Remington and 287 for the others, giving Remington's 15 gain, or two points to each man. For
full particulars of these rifles address

E. REMINGTON & SONS, 281 and 283 Broadway, N. Y.,
OR ARMORY, ILION, N. Y.

This arm was submitted in competition with over
one hundred different systems, American and Euro-
pean, to the Board of United States Officers, appoint-
ed by Act of Congress, 6th June, 1872, for the pur-
pose of selecting the best arm for the service, and of
which Brig. Gen. A. H. Terry was President. It suc-
cessfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for
the military service by all nations is only a question
of time; that whenever an arm shall be devised which
shall be as effective as a single breech-loader, as the
best of the existing breech-loading arms, and shall at
the same time possess a safe and easily manipulated
magazine, every consideration of public policy will re-
quire its adoption.

Resolved, further, That the experiments before the
Board with the Ward-Burton Magazine System have
so impressed the Board with the merits of this gun,
that they consider it as more nearly fulfilling the con-
ditions above specified than any other tried by them
or of which they have any knowledge, and it does
recommend that a number of magazine muskets be
made on the plan for further trial in the field." (See
Ordnance Report.)

We are now receiving orders for these guns, and due
notice will be given in this paper when they are ready
for delivery.

The following is our scale of prices: Special Maga-
zine for large game, carrying from 3 to 8 cartridges,
70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10
lbs. weight, from \$60 and upwards, according to finish.
Special Long-range Magazine Rifle for Creedmoor
shooting, 90 grs. of powder, 480 grs. of lead, carrying
3 to 8 cartridges, weighing 10 lbs., from \$100 and up-
ward. Magazine guns for general use, carrying 3 to
9 cartridges, 60 grs. powder, 350 grs. lead from \$40
and upward. Single Breech-Loader, Creedmoor
shooting, for long range, 90 grs. powder; 480 grs. lead,
from \$60 and upward. Single Breech-Loader for
general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead,
from \$30 and upward. The calibre of all our rifles,
unless otherwise ordered, will be .45-100 in.

NEW YORK**STATE ASSOCIATION**

FOR THE PRESERVATION OF

GAME AND FISH.**THE ANNUAL CONVENTION**

of this Association will be held at

Oswego, N. Y.,

On or about the

FIRST WEEK IN JUNE, 1874,

Under the auspices of the

Leather Stocking Club

OF OSWEGO, N. Y.

It is proposed and expected that this meeting will
eclipse all previous ones held in this State, both as
regard to value of prizes and number of clubs partici-
pating.

A BENCH SHOW OF DOGS.

Will be held at the same time, under the direction of
the State Association.

One day during the meeting will be devoted to

FLY CASTING & RIFLE SHOOTING.

The remainder of the week to shooting from the trap.
Sufficient wild pigeons have been secured to insure
a fair trial to every person who may participate.

The magnificent hotel erected in Oswego by Mr.
Doolittle, capable of accommodating 500 guests, will
be opened June 1, 1874. The additional accommoda-
tion afforded by this hotel enables the Leather Stock-
ing Club to assure all visitors that ample accommoda-
tion for all can be procured at any time during the
meeting.

Circulars and other information concerning the
meeting will be cheerfully furnished on application to

THE GENTLE CRAFT.

A BARD is weak enough you'll find,
A humble cat-gut twangler;
But for a man of simple mind
Commend me to an angler.
He'll fish and fish the whole year round
Devotedly fanatic,
To catch one fish that weighs a pound,
And then his joy's ecstatic.

For twelve long months for such a catch
Who'd be on banks a dangler?
But 'tis a fearful joy to snatch
To the contented angler.
And off he goes and "weighs it in,"
For breakfast has next morn it.
A cat, the thinnest of the thin,
Though fond of fish, would scorn it.

And after that he goes about
The anecdote to retail
Of how he caught that one-pound trout,
With every little detail.
And rival brothers of the craft
Will listen to the story,
And puff their pipes and round him waff
A baccy cloud of glory.

And all about the how and when
He'll argue like a wrangler;
There seems no bliss for mortal men
Like that which waits an angler.
And when he's old and bald and gray,
His children's children dun him,
To tell them of that fish, and say
What great renown it won him.

More blest than men who write for books,
Or versifying mangler,
(Whose lines have rhymes instead of hooks)
The simple-minded angler.
So with this epitaph no doubt
His mild existence closes—
"The man who caught the one-pound trout
Beneath this stone reposes."—*Fun.*

Zoology of the North-Western Territories.

THE CERVIDÆ.

NO part of this continent will compare with the Pacific Coast in the number and variety of the cervidæ; for here they have a mild climate and an abundance of shelter and herbage at all seasons of the year; and they have besides that varying outline of land best suited to be the habitat of the different species; hence, as a natural result, the antlered stag can be encountered in almost every copse west of the Rocky Mountains, but especially in the wooded portions of Oregon and Washington Territory. The largest of the family is the elk, (*cervus canadensis*), and that is very abundant along the foot-hills and low mountains. Its habitat extends from Montana to California, but it is most numerous between the parallels of forty-two and fifty degrees. It frequents the coast mountains running through Oregon and Washington Territory in immense herds varying in number from one to three hundred. It seems to be exceedingly gregarious and very much attached to its young; and in localities where hunters are scarce it is said to be quite docile, often allowing a man to approach it on the leeward side to within a few feet.

A band of elk will scamper at the sight of man if they get his scent, but will scarcely notice him if he is on their lee side; hence, we must naturally conclude that their sense of self-protection is governed entirely by smell. I remember in one case where a party of four of us, bent on an elk hunt, approached a herd of fifty to within twenty paces and they did not even attempt to move. They would raise their heads every few moments to look at us, but the expression of the eyes displayed more inquisitiveness as to what the objects approaching them were, rather than what could be their purpose. That we were the first of our order they had beheld, was evident from their fearlessness; so

acting on this supposition, we approached them boldly, yet taking good care that they did not get an opportunity of sniffing our odor, and in this manner got within twenty yards of them. Fearing they would run after the first fire, and knowing the difficulty of killing one unless shot in a vital part, each selected his animal and aimed at the heart or fore-shoulder. Taking deliberate aim, the crack of four rifles was heard at once, and as soon as the smoke cleared away, we saw two animals lying on the ground, but the other two were apparently uninjured, as they retained their place in the herd. A second volley was poured into them and one succumbed, but the fourth did not yield until it received the fourth shot; it then gave a grunt, attempted to walk, toppled and fell over on its side. The remainder trotted off on the discharge of the last round, but did not go over half a mile ere they stopped again to browse. We should have killed some more of them, but did not wish to destroy what we could neither use nor save, so were content to dress what we had secured, as it would prove sufficient for our wants while we intended to follow the chase in that region. On making inquiries of our guide, an old hunter, as to the apparent stupidity of this animal, he stated that where it was little hunted it did not seem to care for the presence of man unless it smelled him; but where it was driven by dogs that the sight of a hunter caused it to bound off at a tremendous pace, and that it would not stop until it placed many a league between itself and the pursuer. If a herd is startled a stag leads it, the cows and calves being in the centre, and the rear is closed by the stoutest males of the throng. With heads thrown back to keep the antlers from becoming entangled in the branches, and the nose, as a consequence, high in the air, the herd dashes through the shrubbery and undergrowth at a long, trotting gait, and in this manner they will run all day long if pursued by even one cur-dog.

This timidity closes, however, when a stag is brought to bay; then it will fight with a vigor and determination that cannot be excelled. In a contest with a bear I once saw a magnificent male pierce bruin through the body with its many-pronged antlers at one charge, and it did not quit its charging until the bear ceased to breathe. With a proud mien it then stamped on its adversary with the fore leg, and finding life extinct, turned around and trotted off into the damp, dense forest. The contest was so interesting that I could not find it in my heart to shoot the noble-looking, victorious animal, so let it depart in peace. That this species will face man, even before wounded, if cornered, is evident from a tale once told me by an old hunter. He stated that he was at one time escorting a mail-carrier through a new section of country which had just been opened as a mail route, and that while clambering up a densely wooded mountain they suddenly encountered two elk, a male and female. The trail they had been following was formed by various animals on their way to and from a small stream that flowed on the opposite side of the mountain, and where they slaked their thirst; and this was the only passage across the mountain, for on one side of it were ranged huge cliffs of basalt, and on the opposite was a growth of dense shrubbery which extended to the sea that loudly surged at its base some thousand feet below. Both men and elk gazed at each other a few moments; then the latter wheeled suddenly and ran for the summit as fast as the nature of the ground would permit. The men being unarmed and knowing the animals could cross to an adjoining hill only by swimming a rough portion of the sea, concluded that they would not attempt it, but return and force a passage by them; so they began to look out for some means of escape in order to avoid being trampled or gored to death. They soon found a tree low enough, but ere they had made up their minds to leap for its branches, the animals had again come into sight. Having surveyed the means of escape, the elk finding that they could not clamber over the cliffs that lined the path on one side, nor descend into the sea to reach the opposite hill, reasoned, apparently, that they could clear the human obstructions before them with more ease than they could overcome the natural difficulties; and acting on this supposition the male

lowered his head when he came in sight of the men and dashed down the trail at his best speed, closely followed by his mate. The men had not selected their retreat too soon, for they had scarcely swung themselves into the tree ere the animals dashed furiously past, the antlers of the male being as close to the ground as they could be placed. The hunter stated that he had been in many dangerous situations, but he never really felt that benumbing fear which deadens the faculties until that day.

The antlers of a full-grown male have from four to seven prongs, but the number never exceeds the latter figure, and they vary in width from five to eight feet, that is from the outer tip of one antler to the tip of the other. During the rutting season, when the contests between the males is so fierce, many lose a portion of their antlers. It is no uncommon thing to see a burly stag shorn of part of his pronged appendages, leading the herd and ready to defend it against all comers.

The size of the animal ought to fit it for domestic purposes, such as drawing a wagon or carriage, or it could be bred for its flesh. Its speed is so great that it certainly could be used to advantage in a carriage, or it might be employed by couriers who have to ride long distances. The faults of the male could be overcome by treating it like geldings, and this also renders it more docile and social. I saw a pair of stags, treated in this manner, trained to harness, and they certainly could leave far behind them any brace of equines on the road. Something certainly should be done to domesticate this splendid animal; for in a state of nature it is good for naught except its flesh, and the flavor of this could also be improved by domestication.

The next largest species of the *cervus* family is the mule deer, (*cervus macrotus*), an animal that receives its appellation from its long ears and caudal termination, for it is not entitled to it on any other grounds that I can see, as its macrotian qualities cease with these. Its ears, which are certainly mule-like in contour, are nearly as long as the cauda, and the latter appendage, which is slender and devoid of hair beneath, has a black tuft at the end. The hair of the body during the winter is of an ashy brown color with light grey annulations. Its favorite habitat is the mountainous region between the Rocky and Cascade Mountains, and it is never found west of the latter. It may be said to be the deer of the plateaus and mountains, as the Columbia deer is of the forest and lowlands. Its flesh is very palatable, and so far as my taste extends, superior to that of any of its congeners. It is not so numerous as the other varieties, and is also more difficult of approach, as it is very vigilant and a rapid runner; hence, one must have a sure eye to kill many during a season. It is more abundant in the Blue Mountains, which traverse Eastern Oregon, Washington Territory and Idaho, than in any other portion of the continent, as it finds there plenty of food and shelter.

The next in importance is the black-tailed deer, (*cervus columbianus*), which takes its name from the Columbia River. This splendid animal, which is larger than the red deer of Virginia, frequents the heavy forests of fir, and there it browses in comparative security, unless chased by dogs, for it is difficult to find it in still hunting, owing to the luxuriance of the shrubbery. When pursued by hounds it will follow the course of ravines and canyons as much as possible, and will double on its track until becoming fatigued, then, and not till then, will it head for the water. Its mode of locomotion is by long bounds, and the distance it will clear in a stride is certainly very large; and in a steeplechase no horse that ever ran at Punchestown or Doncaster can at all approach it. It will clear the branches of a fallen tree that may jut up some seven or eight feet with the greatest ease; and in one instance I measured a high leap made by a splendid buck and found it was fully ten feet. No sport on earth can, I think, compare with the pursuit of this animal with a good pack of hounds; and that it is appreciated here is evident from the large number of hounds of all grades of purity one meets in many portions of the North-western States and Territories.

It is certainly very exciting for all to know that if the

For Forest and Stream.

TIGER HUNTING IN COSTA RICA.

"I THINK we had better camp here," said the Professor; "there's fresh water in the lagoon there, and we won't be likely to find a more convenient place for a ranche anywhere else before dark."

The sun was just above the line of the horizon, glinting its almost level rays over the water, and lighting up the comb of the long line of breakers with a ruddy glow. The view landward was bounded by a line of low mangrove trees, unbroken save at the spot where we stood, and where a little lagoon, whose waters seemed as black as ink in the shadow of the canes and swamp bushes, offered a slight relief to the prevailing monotony of the landscape.

Our route lay along the beach, upon whose surface the evening mist was already marshalling its gray and shadowy battalions, soon to combine and sweep over the whole expanse. Sodden logs of drift wood, which, in the uncertain, dreamy light, might have passed for the debris of countless wrecks, lay all around. The only bit of life and coloring anywhere visible was that occasioned by our little party, tramping wearily along, clad in colored flannel shirts and blue Dungaree overalls, our belts, from which depended shoes, rifles, revolvers, knives, pipes, pouches, etc., in picturesque confusion, slung carelessly over our shoulders, and our faces and necks, despite the protection of immense coarse straw hats, burned to the color of mulattoes.

"With all my heart," replied I, in answer to the Professor's suggestion, and, relieving myself of my burden of death-dealing instruments, I seated myself, not unwillingly, on a bit of drift, and commenced filling my pipe in that leisurely and scientific manner which denotes your true lover of the fragrant weed. The Professor, after a long draught, *au naturel*, that is, obtained by stretching himself on his belly at the brink of the pool, followed my example, and soon the incense from our blackened clays was floating skyward in undulating rings and long drawn filaments, whose graceful windings through the still air we watched with philosophical contemplativeness born of the solitude. One by one our Indian packmen loomed up through the mist, toiling under their loads over the heavy roads, and soon our whole party was grouped around, busily engaged in the usual simple preparations for our comfort during the silent hours.

A fire was soon built, and a ranche constructed, consisting of posts, over which our rubber cloths were suspended in order to form a protection against any casual showers. Its unaccustomed shape evidently offered a new problem to the reasoning faculties of some half a dozen buzzards, who had appeared in their usual mysterious fashion from the Lord only knows where, attracted by the flesh of a turtle which the Indians had killed the night before, and which they carried in chunks on the outside of their packs. Tu-lus, who, in virtue of his position of leader of the Indians, had left all the menial labor to his inferiors, and had wandered off to a short distance, now attracted our attention. "Un tortuga," signores, said he, "eltengo bien lago," which, being translated from the barbarous Spanish of the coast, meant that he had discovered traces of a large turtle. He soon after came upon the sand nest of one of these curious creatures, and, unearthing two large white eggs, brought them for our inspection. We looked upon them with a degree of interest which, it must be confessed, was chiefly occasioned by anticipations of the welcome addition they would make in the shape of an omelette to our frugal supper of bacon. The marks of the turtle's feet were still visible on the dry sand from the night before, and proved the animal to be, as Tu-lus had remarked, a very large one.

We enjoyed a roll in the breakers, discussed our supper, and stretched ourselves on our blankets under cover of the ranche, smoking, talking, and musing in the red glow of the fire, around which the Indians were collected in an earnest group. They were talking in a patois of their own, but from an occasional Spanish word they used we learned enough to know that they contemplated watching for turtle that night. It was at the height of the breeding season, when the turtles land in great numbers, and they were pretty certain of capturing one, if not more, of these welcome prizes.

With the pleasant prospect of a breakfast of fresh meat, we prepared for the night, and in a few minutes, as far as the Professor and myself were concerned, the camp was silent. When I awoke it must have been after midnight, and, filling my pipe, I crept as softly as possible, in order not to awaken my companion, towards the now smouldering embers of the fire to obtain a light. I had applied the spark, and was squatted on the grass puffing away contentedly, when I felt a most singular and unaccountable sensation stealing over me—a sensation of uneasiness, of impending danger, of the necessity for cautious movement; in short, one of those manifestations of an occult intelligence which we are accustomed to term instinct in animals and "a presentiment" in human beings. Having too thorough a reliance in myself, however, to pay much heed to manifestations of that description, I impatiently anathematized what I considered my foolish nervousness, and rose to return to the ranche. I had hardly gained my feet, however, when my attention was attracted by a movement on the beach, and there, within ten feet of me, was an enormous turtle, tossing the sand up into the air in clouds with her great fins, busily engaged in excavating her nest. The Indians had no doubt strayed off along the beach in search of the very prize now before our doors. I therefore silently awakened the Professor, who arose in his shirt, and we prepared to make sure of our game when—well, *l'homme propose, mais Dieu dispose*—just as we were about to make the rush a dark body bounded past us, falling on its victim, and the next moment we saw a great black tiger tearing at the shell of the turtle, endeavoring to detach it from the flesh. To reach our rifles was the work of an instant, and the two reports blended into one. Before we could reload, the tiger (whether wounded or not we could not tell) threw the turtle over its back and disappeared with it among the canes. The manner in which the Professor tangled himself up in getting into those trousers of his would have shamed the art of the most able contortionist. When he did succeed, finally, he was obliged to reconnoitre operations in consequence of certain difficulties, likely to be experienced by any one trying to wear his clothes hind part before. The Indians at this moment put in an appearance, having been occupied down the beach, where they had turned two turtles. Their horror at learning the nature of the turtle hunter who had interrupted our operations was comic enough. It was nothing, how-

ever, to that which they expressed when we proposed to them to join us in instant pursuit. This they implored us to refrain from, urging the utter uselessness of attempting it in the dark, and reminding us that the tiger, whether wounded or not, would be sure to make a heavy meal off the turtle, and lie down to rest somewhere in the neighborhood, so that we could commence the chase after daybreak with a much better chance of success than at present. This being the rational way of looking at the matter, we posted one of the Indians as sentinel, and lay down again to rest until morning.

With the first light of day the search began, and soon one of the Indians came upon the trail. It was marked with blood, and at first we congratulated ourselves on the certainty that one of the bullets, at all events, had reached its mark; but subsequently, remembering the rough usage to which the unfortunate turtle had been subjected before its worse than Mazeppian ride, we had to count on the possibility of the blood having flowed from its veins instead of those of the tiger. It was no easy matter this following the trail; the tiger's lithe body had slipped through the canes and brush like an eel in an oil well, but we had to cut almost every foot of our way. The ground, which was evidently under water at the height of the rainy season, though dry enough just now, was covered with an almost impenetrable undergrowth, while vines and other twisting plants tied themselves among the canes in Gordian knots, of which Alexander's was the only practicable method of solution. In spite of all our care the locks of our rifles often caught in these tangles, and I have since wondered that our expedition that day was not marked by the shooting of an animal higher in the scale of creation than a black tiger.

After what seemed miles of this travel, we came upon somewhat better ground, where a group of tall trees crowned a little knoll, surrounded on all sides, save that by which we came, by swamp. Here the trail of the tiger ended, and it was with a somewhat uncertain feeling, as regarded our tenure of life, that we became satisfied as to his lying hidden amid the brush before us. The Indians were more shaky on the subject than ourselves; they were afraid to beat the covert, and it was impossible to get a shot at him from without, even had we been perfectly certain as to his position. Finally, however, it was determined that the Professor and myself, together with Tu-lus, and Chanquoi, who had shot guns, should post ourselves behind a couple of huge sand box trees, while the other Indians, with the full permission to run on the first appearance of danger, should endeavor to scare the brute from his hiding place. The point we had selected for our stand faced a part of the thicket where several trees, felled by some tempest, had added to the density of the labyrinth. We had settled on this position from the fact that under one of these fallen trees, one end of which rested on the branch of another some feet from the ground, there existed an opening in the brush which we thought marked the entrance to the tiger's lair. Circumstances proved the correctness of the surmise. Behind and on either side of us lay the swamp—a black quagmire, interspersed here and there by tussocks, covered with rank grass, and between which the gleam of water was frequently apparent—in front of us the lair of a savage beast, whom we must soon prepare to meet in mortal combat. It was one of those moments which string the nerves to an exceeding tension, and bring a fixed look into the eyes, an acquaintance with the appearance of which might often save a roystering bully from provoking his death wound at the hand of some quiet stranger. The Indians commenced operations at the other side of the thicket, confining their efforts, however, to making as much noise as possible outside, without venturing to penetrate into its recesses. Tired of inactivity I foolishly stepped forward and peeped into the opening in the brush. At first all was dark and still as death, the shouts of the Indians seeming to reach me over the thicket instead of through it. In a few seconds, however, I noticed two sparks of fire, motionless against the dark background, just as my eyes, accustomed themselves to the gloom, were tracing out the form of the tiger, a low growl of horrible savage rage made doubt certainty. Up went my rifle, but almost at the instant of its report I felt myself hurled on my back into the swamp, the water in my ears, a fearful weight on my chest, and something warm covering my face and blinding me.

When I recovered consciousness I was stretched out on the grass, the Professor, canteen in hand, kneeling beside me, and bathing my face with rum. One arm was apparently on fire; it was bound up with the fragments of an Indian's shirt, through the folds of which the blood was still slowly spreading. Near by were Chanquoi and Antonio, busily skinning the tiger.

We found on our return to camp that the animal measured four and a half feet. Our shots of the night before had wounded him, though very slightly. The Professor, Tu-lus and Chanquoi had all blazed into the tiger somewhat recklessly, it must be confessed, as regarded my proximity, but with more fortunate result, the Professor's bullet happening to go slap through the brute's heart. My arm was considerably torn, but a few days of quiet and a box of Brazilian ointment (of which we always carried a liberal supply) effected so radical a cure that I have never suffered any further inconvenience from the catastrophe of my first tiger hunt in

CENTRAL AMERICA.

For Forest and Stream.

DUCK SHOOTING IN IOWA.

I HAD been watching the ducks and geese fly over town for ten days and could stand it no longer, so business was dropped, the gun shouldered, and I was soon en route for the prairie, in the wagon of a returning farmer. Riding cut about five miles I left the wagon and cut across to "Parker's pond." The pond is half a mile in length, and a quarter in breadth, except at one point near the middle where it is narrow and passes on each side of a dry island. One familiar with duck shooting would select the island at a glance as the point to shoot from. Passing along the pond, which is grown up with wild rice, the mallards rise in large clouds at every turn, but always too far away to shoot. By the way, ducks know the distance a shot gun will kill, every time. It was now 4 o'clock P. M. and thousands of ducks and brant were soon seen flying south, to some distant corn field; all flying too high to shoot. I knew they would fly lower on the return and so waited patiently for them. A little before sundown a pair of mallards came near enough, and both fell into the water at the crack of the right and left. I had no dog, and in I went. Bah! the

animal escapes them once there is no possibility of finding it again until it reaches the river or sea. As I write this the memory of my last hunt where four of us killed forty deer in five days, rises before me, but it is not the number slaughtered that arouses emotions of pleasure, but the musical chorus of the pack that echoed and re-echoed through the dense forests, and the mellow sound of the horn as it recalled stragglers or those which had carried pursuit too far from our posts. Some operas are delightful and fill our æsthetic cup with pleasure, but for virile music and bounding pleasure, give me hounds and horns and a rosy morning and a full-grown black-tailed stag going at a "view halloo" pace. Every tree and shrub seems to be filled with the melody of the pursuing pack and glad to re-echo its varied tones; while speed is typified by the fleeing antlered creature, whose every movement is replete with grace. Deer hunting is permitted at all seasons of the year in the Territories, but in Oregon the season is limited to the months intervening between July and December; and though many are killed in that interval, yet it does not apparently diminish the number of the animals; at least they seem equally numerous in all the wooded portions of the region.

The white-tailed deer, (*C. leucurus*), another variety, approaches nearer its eastern congener, *C. Virginianus*, than any other of the family. It is about the same size, nearly of the same color, but the cauda is, I think, longer; hence, it is also called the long-tailed deer. It is very common in the forests; yet, its favorite habitat seems to be the copses skirting the borders of prairies. Being smaller than its congeners, it is not deemed as good for sporting purposes as the others, though its flesh is soft and tender. When pursued by dogs it will not double like the black-tailed, but will make a straight shoot for the river, following the course of one of the numerous trails which it makes to its watering place. Its jumps are shorter and more rapid than those of the other varieties, and it also seems to tire more quickly, for if it is checked on its way to the river and made to retrace its steps it is often caught by the hounds after a run of three or four hours. The males of this species have many deadly quarrels during the rutting season and one is often found dead in the woods. They are also very bold at this time, often jumping into the garden attached to a farm house to lead the female to good and delicate pasturage. In many places they are so abundant as to become a nuisance, for no fence will keep them out; hence, poison is sometimes resorted to in order to check their depredations. I have known instances in Washington Territory where one man with a rifle killed eight in his own garden one evening; nor did he have to move from his chamber to do it. Their abundance may be deduced from this fact.

An Albino deer is found on Whitley Island, at the northern termination of Puget Sound, and it is said to be the principal species there, though it is not found in any other portion of the Territory. It is generally of a pure white and rufous mixed; some spots being pure white, others bay or red. That it is a hybrid is evident, but from what descended cannot be very well stated, as the only other deer found there is the white-tailed, (*Cervus leucurus*.) An animal of this species was captured recently on a low range of hills in Oregon, and was given to the Museum of Natural History in Portland. I examined closely to try and discover from what species it was transmitted, but failed to satisfy myself on that point. The only fact I could prove was that it was more closely allied to the white-tailed deer than to any other species; and yet it differed from the former in many ways. I measured the specimen and from my notes give you the following as its dimensions, hoping some one will definitely define its standing among the cervidæ:—

Length of body, thirty-five inches; length of head, nine inches; length of cauda, nine inches; height, twenty-seven-and-a-half inches.

The front part of the head, near the antlers, is white; below near the nostrils it merges into a dark chestnut with greyish tips; cheeks white; ears white inside; reddish-brown outside; a broad white dorsal band on body extending from ears to cauda; sides dark chestnut, mixed with greyish white; belly and flanks as far as knee, pure white; lower part of leg light rufous. The under portion of the cauda white, the top near the base white mixed with brown, the former prevailing; middle ash or pale rufous, and tip white. It is a beautiful animal, and in gracefulness will equal any of the family. It is very scarce where this specimen was found in Oregon, and as it is not mentioned in any work on zoology, we must suppose it to be a new species. A very appropriate name for it would be *cervus var-color*, or *variatus*, for it has hues and spots enough to entitle it to either cognomen; so, acting on this idea, we have given it the latter. I have heard from old hunters that a snow-white deer frequents the highest peaks of the Siskiyou Mountains which separate Oregon and California, but that it is rather rare, and very difficult to approach owing to its vigilance and the rocky character of its exalted domicile. I supposed at first that they had reference to the mountain goat, but their anatomical description was so correct that I gave credit to their assertions. I subsequently learned from an aged Indian that such an animal did exist but that it was a new arrival, their forefathers not being acquainted with any such animal. He stated that it was first seen previous to the advent of the white man, and that their prophets predicted from this circumstance that a white race of men would drive the red man from his home; and that like the white deer, the pale face would be cautious, vigilant and hard to kill, and would finally prevail by numerical superiority. This legend, poetical as it may seem, is founded on truth if its distribution among the various tribes is a proof of its veracity. Should this animal exist, it would account for the hybrid mentioned, as it would then be a cross between it and the white-tailed deer.

The only species of the cervidæ not enumerated, is the antelope, (*Antilocapra Americana*), and that is very abundant throughout the North-west in the region lying between the Cascade Range and the Rocky Mountains. Its vigilance and fleetness make it difficult to hunt, so the most common method of capturing it is to arouse its inquisitiveness by tying a red rag to a pole stuck in the ground and lying in wait until it approaches close enough to be shot. Greyhounds have been used in one or two places to hunt it, but they were left so far in the rear by the fleet-footed creature, that they could not be induced to pursue it at all after a few trials. If one wishes to practice patience and perseverance, the best way I know of is to send a person hunting antelope for a week or two, and if he does not learn it then, there is little use in further efforts.

MORTIMER KERRY

water was cold and the mud was awful deep. The drake was only winged and gave me quite a chase before I drove him to land. By the way if you wing a duck in the water just wait a little and it is sure to come to the land. Before I got out a dozen good shots passed me. It was getting into twilight, and they soon came thick enough to empty a dozen guns. I now fired as fast as possible (with a muzzle-loader) retrieving only such as fell near me. Every shot told, for my coat and cap were just the color of the grass, and in the dusk they paid no attention to me, several alighting in the water within a rod of me. After firing a dozen rounds it so happened that I had one barrel empty and the other loaded except the shot, and putting the wad down while watching a flock of brant, I put it in the empty barrel and could not reach it with the wad screw, thus disabling one barrel. While cursing my awkwardness I heard a rush of wings, and looking up saw two brant within thirty yards of me. In an instant one of them had turned to a limp mass of flesh and feathers, and splashed into the water at my feet. I had barely loaded when a hundred more passed, high over head. Another long stream of fire (for it was now fairly dark, and cloudy) shot upward and a brant came whirling into the water. Well, I took a big wade after that fellow, stepped in a hole and fell down, getting wet to my waist, but I got that brant. It was now too dark to see a duck, so I tied up my game and had just slung it across the gun when I heard a faint "honk." By the time I could get the gun free the flock were right over me, so close that in the darkness their wings seemed to spread ten feet. I knocked one into the pond, and had another big wade, but got the gander. Now some of you sportsman imagine my situation. Time 8 o'clock in the evening, five miles from home, wet to the waist, and my clothes beginning to freeze, hungry and tired, with a load of eighteen mallards, two brant, and a twelve pound goose to carry, the nearest house a mile distant, and no telling if I could stay there as I had no acquaintance nearer than home. Yet to say I was happy would hardly express it. I was exultant. Several of the "boys" had been out and I knew my bag would beat all theirs combined, besides I expected to get at least a dozen dead ducks out of the pond in the morning, so I shouldered my load and marched off toward the only light that was visible on all that wide prairie, and after floundering through mud and water and falling over gopher hills for half an hour I reached it. I was hospitably received and soon sat down to a smoking supper of ham and eggs, and excellent coffee. No one who has not "been there" can imagine the enjoyment of such a supper. My host and I soon found that we had been almost neighbors in our native country; so the pipe and talk of the "old times" beguiled us into the small hours before we were aware.

After a hearty breakfast (one always gets up hungry in the country) I went to get my ducks out of the pond. A coat of ice was on the water, and the hawks had picked up every duck, (I've made hawk shooting a specialty since then) so I got no more.

I have been out a few times since and have bagged one hundred and thirty ducks, seven brant, three geese, two curlew, one sand hill crane, and a dozen snipe this spring. If any of your readers visit me on their shooting excursion next fall, and I hope they will, I shall take some pride in putting them to sleep on a bed, every feather of which is my own killing.

O. H. HAMPTON.

For Forest and Stream.

THE CRUISE OF THE "TIGRESS."

WASHINGTON, D. C., May 28th 1874.

EDITOR FOREST AND STREAM:—

My time has been so completely occupied with business for some weeks back, that I have been unable to render unto FOREST AND STREAM, the things that should have been its, but I think that the "Bear Story" which I enclose will pay for my neglect. It is as communicated to me in a letter from my friend Lieut. Col. White, U. S. Navy, who, while executive officer of the "Tigress" in her search for the "Polaris" had the encounter, and bagged the bear as he describes. "PISCO."

AFTER A POLAR BEAR WITH A WHALE BOAT.

THE scene is laid in Melville Bay. To geographers this bay is an indentation of the west coast of Greenland, extending from Cape Shackleton on the south, to Cape York on the North; yet Melville Bay to the Arctic navigator comprehends much more, its shores are the fruitful source of many of those huge masses of ice which so often imperil the safety of the northern cruisers, and its waters the birth place of the heavy pack ice, which so often has caught unawares the whale fleet, sending to destruction the strong ribbed ships and their crews. Very few of the gentlemen sportsmen of any country are permitted to witness the scenes to which for a moment I would like to introduce you. The entire coast of Greenland from Cape Farewell to the most western limit visited by explorers, is composed of lofty precipitous mountains, down whose innumerable gorges flow those great Arctic rivers—the Glaciers—the most inferior of which overreaches by far the famous Mer de Glace, and Grindelwald of the Alps, and from these frozen streams, the great icebergs are constantly pushing their way into the adjacent waters.

Melville Bay is a famous rendezvous for these huge ice mountains, they being swept into it by the currents which seem to centre there, running from the north as well as the south. Six hundred bergs were counted, on one occasion, from the deck of our little vessel, of all sizes and shapes, from the "hummocky bits" of the whalers, to the towering masses, in some cases reaching an attitude of four hundred feet, and their whole mass may be imagined when it is known that but three tenths of the bulk is above water, leaving seven tenths as the under water body. Imagine these huge floating monsters lighted up by the varying tints of the never setting sun, during the Arctic day, reflecting from the deep chasms all the colors of the prism, or from some salient angle the rich deep colors of the amethyst, sapphire, or jasper; or perhaps from a score of beautifully chiseled minarets of some imaginary mosque of a warmer clime, or the well defined battlements of a mountain fastness, come the flashing brilliant tints of the diamond or emerald; and this, not from a single iceberg, but from hundreds, as far as the eye can reach in any direction, all gleaming in their cold magnificence, producing a fair scene, which tales of oriental splendor cannot surpass.

In the midst of just such a scene as this, we found ourselves one morning, and while dreaming of the disasters which Melville Bay has witnessed, and of the scores of good ships whose strong frames are strewn over its bot-

tom, I was aroused by the cry "A Bear"! "A Bear"! As a single man, officers and crew jumped to the deck to see the stranger who had ventured so far from *terra firma*, for we were seventy miles from the nearest point on the Greenland coast. Rifles were at once called into requisition, but our game was out of range, as a shot or two proved; the bear was swimming about, turning his great head from side to side, looking curiously at the ship as if in wonderment what such a superior sized animal could possibly be, half desirous to approach and satisfy his curiosity, and half afraid thus to indulge himself. If he was to be captured, evidently it must be by giving chase in a whale boat; here was a chance not to be lost, and with four men and my carbine I started. The waves were running high, the effects of a gale of wind the day before. Bruin evidently did not fancy the appearance of the whale boat; he disappeared at times, and was sagacious enough each time he reappeared to change his bearing from us. The chase was a long and exciting one. In my eagerness to start in pursuit I had neglected to take any other weapon than a single carbine, a neglect which might have resulted seriously had any accident happened to the piece, or had it missed fire at close quarters; with this thought in my mind, I decided upon a shot when still at a respectable distance away, but the heavy sea made my aim uncertain, and resulted in wounding the bear in the lungs, a painful wound, which made him perfectly furious. He at once turned upon us, and seeing his move to flank us, I placed my carbine in a secure position and turned quickly to catch the steering oar; an unfortunate sea at this moment struck the boat, threw me over the gunwale and carried away from my hold the steering oar. To regain my footing in the boat was the work of an instant, and by means of backing on one side and pulling on the other, I finally succeeded in getting the boat into a favorable position, head to sea. My enemy now was close aboard, urging himself onward by his great outspread webbed paws, bleeding profusely, and howling with pain, and showing an excellent set of teeth with which it was his evident intention to satisfy himself for the injury I had done him; and the look which he gave me from his fiery eyes, I shall never forget. Now was the critical moment! to miss my mark now, would result in a heavy breakfast for bruin, for one paw on our gunwale, he would have it all his own way, and the ship was at least two miles away. The men appreciated this fact, and never was a boat in a heavy sea kept more religiously in position than was ours. "Steady" was given to the men, who waited breathlessly the result. Crack went the carbine, and the great beast, his defiant angry look unchanged, bowed his head, pierced through the brain. So close were we to him that before his struggle was ended, I had grasped his short fat tail and slipped a bowline about his quarters; he proved a heavy tow, but in the course of time we reached the ship, and all hands turned to hoist the prize on board. He measured eight feet in length and his weight was six hundred pounds. His color, like that of all the so called polar bears, was a yellowish white, with a firm thick coat of hair; the stomach was found to be quite empty, and his famished condition was probably the cause of his boldness in nearing the ship, for in the water the white bear is cautious. The meat of a lean bear is much more palatable than that of the well fed animal. Their diet consists of seals caught either in the water or on the flat floating ice. And in the well fed bear the impregnation of the oil, through the cellular tissue, renders the meat next to uneatable, except to the Esquimaux. Fortunately for us the bear which I obtained was lean, the flesh was of a rich dark color, much resembling reindeer meat, sweet and tender, and for a week all hands regaled themselves with bear steaks and roasts from his generous sides.

The skin now forms the most choice of my collection of trophies, and the ball which gave him the *coup de grace* next in value. And in a more genial, though less romantic climate than the one I have attempted to describe, I find myself constantly and pleasantly reminded of the most eventful of my sporting days.

The Horse and the Course.

—Quite an effort is now being made in England to introduce cattle from the Argentine republic into England, and very probably before long horses from South America will be put in the English market. We remember (we think it is some three years ago) to have seen, coralled in a lot in Brooklyn a number of South American horses. Poor vicious looking brutes were they, undersized, and in dreadful condition. We think there came up in our minds, at the time, some idea of addressing Mr. Bergh in regard to them. Many of them had their under-jaws cut from cruel handling. They were a sorry lot, though some few of them had clean limbs, and game heads. We were told the horses were the property of a traveling circus, that had just arrived from South America.

The bulk of these animals were sold at auction, and brought very low prices. We should feel exceedingly obliged to any of our readers if they would give us any information in regard to these horses, and how they turned out.

—The Fleetwood Park Association closed the spring meeting on May 29th with two splendid trots. The first trot was purse No. 7, of \$500 for horses that have never beaten three minutes, mile heats, best three in five in harness. There were eight starters. Lady Dohlman being the favorite and winning the first heat. Cora F. won the three next heats and race. Time, 2:36½, 2:38½, 2:35½, 2:37½. The last race was the great event of the meeting as Judge Fullerton and American Girl were to meet in the \$2,000 free for all purse, mile heats, best three in five, in harness. American Girl won the first heat. On starting for the second heat American Girl broke up badly. Judge Fullerton trotting along at a rapid gate, and won easily. The horse won the next two heats and race. Dan Mace drove Judge Fullerton and he was so weak from his late illness that he had to be helped on and out of the sulky during the race. Time, 2:35½, 2:33½, 2:22, 2:23.

—The Jerome Park stables are rapidly being filled with arrivals of thoroughbreds engaged in the stakes at the forthcoming meeting of the American Jockey Club, which will begin on Saturday next. The latest arrivals are the stables of Col. Daniels, George A. Rice, D. J. Bannatyne, A. Belmont (the Baltimore horses), and D. J. Crouses. Col. McDaniel's string comprises twelve horses—Abdel

Korie, Katie Pease, Sue Washington, colt by Asteroid, Josie B., Stony Brook, Springbok, Mary Buckley, Madge, Willy Burke, Fluor Ange, and bay filly by Red Dick, dam Etta Shippen. D. J. Bannatyne's horses at Jerome Park are Duffy, who will no longer take part in hurdle-races or steeple-chases; Vonved, Electric (a green steeple-chaser), and Elmwood, by Baywood, dam Lark. George Rice's string comprises Wanderer, Stampede, Vortex, Volcano, and Moonbeam. Except Wanderer, all the others will not be able to run at Jerome Park. Several other stables expected were to arrive from Baltimore and the training quarters in this neighborhood. Mr. Belmont's string will comprise fourteen horses; Messrs. Hunter & Travers's, twelve; Mr. Sanford's, eight; Mr. Morris's, six; Mr. Lorillard's, twelve; A. B. Lewis & Co.'s, eight. There will be nearly two hundred horses at Jerome Park during the coming meeting.

—The Harlem Railroad Company will run trains to Fordham and the Jerome Park siding, leaving the Forty-second street depot each day during the meeting at twenty minutes to twelve A. M., five minutes past one, two, and half-past two P. M. The two P. M. train is a special, and will have cars especially reserved for ladies.

—There were five match trots at Fleetwood Park on June 1st. The first was a match for \$2,000 between J. De Camp's g. g. Billy and J. Trout's br. m. Ledger Girl. The former was the favorite and won in three straight heats. Time, 2:40½, 2:40, 2:38. The second race was for \$1,000 between John Murphy's gray mare Alice Gray and Dan Pifer's bay mare Even Jane. The former was a great favorite, and won the race at her ease in three straight heats. Time, 2:49, 2:59, 2:52. The third race was for \$500 between J. L. Doty's black mare Bet and John Murphy's bay mare Maggie. For the first heat Bet was the favorite, and won the race in fine style in three heats. Time, 2:55½, 2:52, 2:52. The fourth match race was won by Bricks in three straight heats. Time, 2:43, 2:49½, 2:49, and the fifth and last was won by Patsey Bolivar. Time, 2:48, 2:47, 2:50.

—The Suffolk Park Trotting Association at Philadelphia, closed on May 29th with a good attendance and fine trotting. The first race was to saddle for horses that have never beaten three minutes. There were three entries, the b. g. Irishman, b. m. Gold Elsie, and b. g. Daniel Tompkins. Four heats were trotted, Irishman winning three of them in 2:40, 2:38½, and 2:34½. The second race was free to all for a purse of \$600, and the entries were the b. m. Ella Wright, b. g. Stewart Moloney, and b. g. Hotspur. The race was won by the latter in three straight heats in 2:31, 2:28½, and 2:31.

—The race at Point Breeze Park, Philadelphia, on May 30th between the pacer Copperbottom and the trotter Goldsmith Maid was witnessed by three thousand persons. The track was rather heavy and the time made was not as good as expected. The trot was for a purse of \$2,500, mile heats, best three in five, in harness, \$1,500 to first, \$1,000 to the second horse. Goldsmith Maid won in three straight heats. Time, 2:25½, 2:24½, 2:35½. Another contest for \$200, three in five, in harness, between s. g. Hunter, r. m. Lady Norway, and b. g. Daniel Tompkins, which was terminated by moonlight, resulted in favor of Hunter. Time, 2:25½, 2:24½, 2:25½. Another contest for \$200, three in five, in harness, between s. g. Hunter, r. m. Lady Norway, and b. g. Daniel Tompkins, which was terminated by moonlight, resulted in favor of Hunter. Time, 2:45, 2:42½, 2:41½.

—The arrangement proposed by the Monmouth Park Association, by which it was intended that the American Jockey Club should control the racing at Monmouth Park, not having been carried into effect, the American Jockey Club will not participate in the management of the coming meeting at that course.

—The Maryland Jockey Club closed the spring meeting on May 29th with the following events:—

First race, Selling Race, for three-year-olds; mile and a quarter; purse \$5,000, of which \$100 to the second horse; six horses started. Hurrah, 1; Mollie Darling, 2; Hattie Howard, 3. Time, 2:15.

Second race, Handicap purse, for all horses that have run during the meeting; \$600, of which \$100 to the second horse; two miles; four started. Granger, 1; Catesby, 1; Business, 3. Time, 3:35½. The judges declared a dead heat between Granger and Catesby, and their owners divided the purse.

Third race, Compensation Purse \$500, mile heats, three started; Padiadeen winning. Dublin being second, and Coronet distanced. Time, 1:44, 1:44½, 1:49½.

Fourth race, Grand Steeple chase; Post Stakes of \$50, half forfeit; club to add \$700 for the first horse, \$100 for the second, and \$75 for the third; about two and a half miles, and the regular steeple chase course; five subscribers; two started. George West, 1; Milesian, 2. Time, 5:47.

—The Beacon Park spring meeting, after two or three postponements on account of rain and the engagement of professionals at Lawrence, was brought to a close on May 29. There was but one regular race on the card. A purse of \$150 for 2:50 horses, mile heats, three in five, to harness. Carroll's b. m. Glencoe Belle won in three straight heats, beating Woodward's b. g. Tom and Brock's b. g. Eugene. Time, 2:38½, 2:41½, 2:30½.

There was a match for \$500 between Owner's Little Dick and Owner's Champion light weight, and was won by the former in 2:48, 2:53½, 2:43½.

—The Utica Park Association will hold an extra meeting on Friday and Saturday July 3rd and 4th. The first day-purse of \$500 for horses that have never beaten 2:48, also a purse of \$800 for horses that have never beaten 2:34. The second day there will be a purse of \$700 for horses that have never beaten 2:38, and one of \$1,500 for horses that have never beaten 2:27.

—The Auburn Driving Park Association will hold their meeting on Friday and Saturday, July 2d, 3rd, and 4th. The meeting will be held on the grounds of the Cayuga County Agricultural Society, and promises to be one of the largest ever held in Auburn.

—A saddle put on loosely, with a slack girth, is very irritating to a horse, and soon produces a sore back.

—All carriage shafts of right construction should allow the body of the animal perfect freedom, and only touch at the well-padded saddle and full collar.—N. E. Farmer.

THE ROBIN.

SHE hung the cage at the window;
 "If he goes by," she said,
 "He will hear my robin singing,
 And when he lifts his head
 I shall be sitting here to sew
 And he will bow to me, I know."

The robin sang a love-sweet song,
 The young man raised his head;
 The maiden turned away and blushed;
 "I am a fool," she said,
 And went on brooding in silk,
 A pink eyed rabbit, white as milk.

The young man loitered slowly
 By the house three times that day;
 She took her bird from the window;
 "He need not look this way."
 She sat at her piano long,
 And sighed and played a death-sad song.

But when the day was done, she said,
 "I wish that he would come!
 Remember, Mary, if he calls
 To-night—I'm not at home."
 So when he rang, she went—the elf!
 She went and let him in herself.

JUDGING ON THE SHOW BENCH.

WE are pleased to note the growing interest that field sportsmen, shooting associations and clubs are manifesting in all matters connected with the dog. We have from time to time placed before our readers some of the most instructive and practical matter emanating from the very best authorities, both at home and abroad, relative to the Canine World. The secretaries of the numerous Sportsmen's Associations in the West, and especially the ably conducted association of our own State, have informed us that it is proposed to inaugurate field trials and a bench show for dogs. The FOREST AND STREAM has already published the rules and regulations, the laws and usage in field trials, suggesting some alteration of the same to suit our American bred pointers and setters. We shall now place before our readers from week to week a series of short articles from the London *Fancier's Gazette*, showing the points, color, action, symmetry, &c., of sportsman's and non-sportsman's dogs on the show bench. We therefore begin with the magnificent animal the mastiff, as our friend "Veritas" says, the "Noblest Roman of them all."

THE MASTIFF.

Head massive, broad between the ears; ears small, fine in substance, and just wide enough to cover the aperture of the ear proper; they should lie close to the head in a pendent form, and be set well back in head; jaw not long, but proportioned just sufficiently to make the muzzle appear square; flews deep; eyes for a large dog rather inclined to be small, with a mild expression.

Neck muscular, the neck-bone showing a slight prominence at the setting on of the head, and free from throatiness; shoulders wide and powerful; chest wide and deep; back straight; loin of great substance, well ribbed up; hips well developed, with muscular stifles; legs strong and powerful; feet round; coat short and thick, fawn-colored; muzzle dark; stern fine, but not to go off at the point sharply. Brindles and reds are also allowed, but the fawn-color is most in fashion. Weight anything over 130 pounds, symmetrical and well-proportioned, we consider good size.

THE ST. BERNARD.

Head wide and full, giving a grand majestic appearance ears small for the substance of the head, set on where the head curves at each side; eyes deeply sunk in head; head wrinkled between the eyes; lips pendulous; jaw powerful, with good teeth; a white blaze or streak up the forehead, meeting the white color of the neck; neck of great strength; shoulders massive; chest deep; fore-arm to show great bone and muscle; legs straight and powerful, with a dew claw; feet round or nearly so; back long, of great substance, with deep ribs and powerful, wide loin; hips and hind-quarters thick and broad, with well-bent hocks; stifles well developed; tail bushy, not carried too high. The model dog of this breed, old Tell.

A correspondent from Corinth, Miss., says: "We have a fine pack of fox hounds here, and some well bred pointers and setters. I have three pointers, a daughter and grand daughter of 'Pious Jeems' of Lockinvar's celebrated bitch 'Kate,' and one of unexceptionable strain, bred in Middle Tennessee. Col. T. Syd. Warren owns a setter said to be a Laverack.

HYDROPHOBIA.

A GREAT deal is being written abroad just now on the Rabies and Hydrophobia. We notice that *Land and Water* takes from the FOREST AND STREAM, Dr. Yar-row's method of treatment for hydrophobia, which consisted in probing the wound thoroughly, treating with nitrate of silver and using poultices in order to create a free discharge.

We hardly know whether to consider the method of preventing the bite of a mad dog from inflicting injury, as proposed by M. Bourrel of France, as serious or not. Both the *Field* and *Land and Water* give it prominence, although *La Chasse Illustrée*, seem to look at it rather in the light of a joke.

Mr. Bourrel is the author of a treatise "On Rabies in the Dog and Cat," which was read before the French Academy of Sciences in April last. We quote as follows:

"M. Bourrel had the daring to perform the operation of filing down the teeth on three dogs when they were in a condition of raging madness, notwithstanding the danger of inoculation he incurred both during the preliminaries and the different stages of the process. Six dogs kept for experiment were then delivered over to the mad animals, who precipitated themselves on them and bit them furiously, but without breaking the skin in any one of them. The dogs experimented on were watched during six months, and madness did not show itself in any of the number. M. Bourrel, convinced that the blunted tooth of the dog could not penetrate through clothing, gave his hand covered with a glove to one of the mad dogs. "When," he says, "the dog released it, the glove was intact, and the bite had only produced a deep impression." This experiment, repeated on dogs who were not mad, to which I gave my naked hand to bite, proved to me that the blunted tooth can but very rarely, however great may be the contraction of the muscles of the jaw, break the epidermis of animals, whose hair necessarily deadens the pressure exerted; and can only injure the human epidermis in very exceptional cases."

We have no doubt but that exactly as the snake charmers draw the teeth of the cobra capellas and deprive them of the power of injecting their venom into the fluids of the human body, so if dogs had no teeth at all, they would be incapable of inflicting injury. The question is how are we to draw all the teeth of the dogs, or where can the canine dentist be found, who will take for a job, the filing off or blunting of all the incisor teeth of the curs? Given, a mad dog, how many Monsieur Bourrels could be found, who would try the experiment?

—Alderman Morris' ordinance in regard to muzzling dogs in New York was signed by Mayor Havemeyer last week. The ordinance provides that all dogs in the streets, lanes, highways, parks, &c., shall have a wire muzzle sufficiently large to cover the head entirely, but so constructed as to admit of the dog opening its mouth to the fullest extent. The penalty for not following this stupid ordinance is \$3 for each offence. The ordinance applies only to dogs of the age of six months and upwards. Now we suppose that, excepting the wire workers, (not political,) and the muzzle manufacturers, every body with a grain of common sense, is opposed to this unnecessary infliction of punishment to dogs. When Mr. Bergh was consulted in regard to the muzzling of dogs he declined to use his influence in enforcing it, asserting that it might create what it sought to prevent—namely, cruelty. The whole spirit of the law is like the old one made for witches. They threw the old women in the water; if they sank and got drowned they were not witches and innocent, but if they floated, they were tortured to death because they were witches. What is the use, after all the light thrown on this subject, when Mayor and Alderman act diametrically in opposition to all the rulings of common sense.

QUAIL vs. DOGS.

SUFFERN, N. Y., May 24, 1874.

EDITOR FOREST AND STREAM:—

Under the heading of "Do Quail Withhold their Scent?" in your issue of the 14th inst., is an article from O. H. H., who, after quoting a sentence of mine in relation to the above, proceeds to give his experience to show that I am in error. Now, without any intention of entering into a controversy with those who may differ with me, I still desire to maintain and defend my views as they originally appeared. O. H. H. begins by saying: "I have shot quail for years, shot thousands of them, and tried my best to find out if they do, but I don't know." Toward the close he says: "It is generally impossible for the dog to scent quail just after they have been frightened by a hawk," and adds: "This seems to confirm the theory that they do withhold their scent, and that they do it involuntarily, as the hawk does not pursue by scent." Now this seems to me contradictory, for he says, first, he "don't know," and then follows it with "this seems to confirm the theory," which is equivalent to saying they do have the power of withholding their scent. O. H. H. has found it "generally impossible for the dog to scent quail after being frightened by a hawk," and yet he has seen dogs point a single quail (closely hid and of course badly frightened) from one to two rods distant." Will O. H. H. be kind enough to enlighten us as to the difference (if any) there is in the attitude, actions and scent of a quail when frightened by a hawk or when scared by dog or man? Does he mean to say a dog can scent and point quail (no matter how badly frightened) at a distance of from one to two rods, so long as they have not been frightened by a hawk? Is that what you mean, O. H. H.? And this dog, after pointing this frightened quail, passed within one foot of a bird just shot dead and did not smell it! Wonderful dog! Knowing quail! Scent withheld. What "tremendous" power was there, my countrymen. O. H. H. has never yet seen the dog that could smell a live quail three feet, where there had been a brisk rain falling long enough to give the birds and their cover a good wetting. Well, friend H., you must have had, considering the years and the thousands of quail you have shot, a poor lot of dogs to say the least. The best sport some friends and myself ever had together was about five years ago, one rainy day, shooting quail. We were wet to the skin and willing to stop, but our dogs found the birds so easily, so quickly, and pointed so beautifully that we could not find it in our hearts to draw them off until our guns, failing us through fouling, compelled us to desist. And now, Mr. Editor, don't you think it would be well for the sportsmen in general to bear in mind the fact that simply the ownership of a dog does not make him the best dog in the country, and also

that a dog may exhibit a decided preference in finding live quail to dead and *vice versa*, and that a dog may hunt well one day and not the next day, even hunt well in the morning and be utterly useless in the afternoon. A great deal of useless discussion, ill will, &c., would be dispensed with, were we, one and all, to heed the above and believe it. For O. H. H., until he can reconcile the differences, inconsistencies and contradictions in his former letter and answer my interrogatories, will not trouble you with anything further from yours, very respectfully
 E. S. W.

[Can quail withhold their scent? They cannot.—Ed.]

SCENTING POWERS OF DOGS.

SHREWSBURY, May 11, 1874.

EDITOR FOREST AND STREAM:—

That there is a great difference in the scenting powers of dogs at different times every sportsman must know. And all extraordinary feats of this line should be cited as exceptions. It is also true that practice will make one dog recognize the scent of game where another one with equal and likely better scenting powers may pass without giving it the least notice. Some dogs mature very slowly, and from experience I can say to brother sportsmen, if your dog has good blood and is not lazy, do not get easily discouraged if he does not take notice of game, even at one year old. I am the owner of a fine orange and white bitch that at fifteen months old was worthless, as far as finding game goes, but I know the stock (Mr. Taylor's, of Cotts Neck, N. J.; the same stock as his one-eyed Sancho that figured so creditably at Pine Brook on snipe the spring), and took pains in training her, and she has turned out very well. In mentioning the following incident I do not wish to be considered as representing this bitch as being an extraordinary dog, and in justice say that I believe that several others own better and of the same stock. I was quail shooting in a piece of woods, when my bitch pointed a pair of quail near a pile of wood. On being flushed they separated and killed them both. The bitch could mark one bird fall, but from the direction taken by the other a pile of wood prevented her seeing it fall even when flying. After retrieving the bird she had marked down, I coming to me on the other side of the pile of wood she passed within about thirty feet of the other dead bird, and at that distance scented with the dead bird in her mouth. The bitch is an excellent retriever, and the above incident I look upon as an extraordinary exception to the general scenting powers of dogs, and mention it to show to what a degree meety it is possible for the nose of a dog to arrive at. CHECK COND.

Natural History.

A DOMESTICATED OTTER.—The directors of the Zoological Garden at Berlin, Prussia, have tried to obtain possession of a splendid specimen of otter which was caught last year in the Saate River, near Grochlitz, by a Mr. Kaiser, superintendent of fisheries. There is nothing extraordinary in this fact, but the characteristics of this animal are so much in contradiction to the ordinary habits of otters in general that a recital of the history of this specimen may be of interest.

When caught, the otter was nearly full-grown; Mr. Kaiser put it into a stable in his yard. At first, it was very shy and left its lair only when prompted to do so by hunger. After a while, the melancholy of the creature suddenly changed into bellicosity, the water pirate barked and snapped at everybody approaching him, and kept his visitors at a respectful distance, under penalty of sharp bites and tattered clothes. Its daily food consisting of fresh fish and milk, the animal received frequent showers of baths of cool "aqua communis" through a hole made for that purpose in the wall of the stable. In the course of last winter the character of the water-witch underwent a new change. The fighting mood subsided into perfect gentleness, and the ferocious prisoner became a domestic pet. The animal now rambles free through Mr. Kaiser's grounds, takes its food from his hands, climbs upon its keeper's shoulders, performs several tricks like a trained dog, and calls for its regular baths. The creature is now apparently fully developed, has a thick fur of velvety softness and behaves so well, that it does not even steal, although it begs when it sees others eating. The owner has brought this about by untiring care and perseverance in this domestication of so shy an animal, and has declined to sell it to the Zoological Garden.

THE "HAMMOCKS" OF FLORIDA.

EDITOR FOREST AND STREAM:—

I see that a reader questions my use of the word "Hammock." No doubt it seems as peculiar to him as it did to me when I first heard it. My first impression was that the term was simply a corruption of hammock or hammock, and perhaps it is; but it, in Florida, has a purely local meaning not applicable to either of the others.

An old writer classifies the land of Florida under the heads, "pine hammock, savanna, swamp, marsh and bay, or cypress galls." He mentions the existence in the hammocks of "*chamaecyparis prostrata* palmately *stipitibus ferratis*, of whose fruit all animals are very fond." He says the pine barrens receive their name from the "*pinus foliis longioribus ex una thea ternis*." I suppose anyone with a clear head can see the difference between lands bearing such widely dissimilar trees, where the author so clearly states their specific names. Further, under the head of "high" and "low" hammock is comprised the richest land of Florida. For land that produces crops of cane year after year, the Floridian will choose hammock land. If I were writing a letter upon the agriculture of Florida, I might go on and describe the many advantages possessed by hammock land over the rest; but I am not, and find that instead of merely supporting myself in the use of the term "hammock," I have branched off into the relative merits of the peculiar qualities of Florida vegetation, soil or what not, termed hammock and pine land.

Whether the term is confined to Florida or not I am unable to say, but certain it is that it has a peculiar signification not possessed elsewhere. It may be applied to any clump of trees strikingly different from those surrounding it, as "cabbage (palmetto) hammock," "live-oak hammock," &c. Regarding soil, it is called "shell," if high and growing upon one of the many shell heaps of Florida, or "swamp," if low and wet. If what I have said will induce some one of your readers to give me the definition of the word I shall retire to my hammock perfectly satisfied.
 FRED. BEVERLY.

—For a section of country so recently settled as Oregon and Washington, it is somewhat singular that hounding and the chase should be carried on with an expense and magnificence of proportion that vie with the practice of the pastime in England. Nevertheless, the kennels are numerous and regally stocked with the best strains, often fifty dogs or so in a pack, and so abundant is the game and

so fleet, that while every man naturally becomes a hunter, dogs must be employed in the chase, as still hunting yields but meagre returns. See "Mortimer Kerry's" article on the Zoology of the Northwest in our issue of this week. We shall some day receive from his pen, no doubt, a statement of the kennels of the Cascades and the Coast range.

NEW YORK, May 25, 1874.

FOR FOREST AND STREAM:—

In your issue of the 21st inst. I noticed an article by "Jacobstaff," in which he inquires "How many of our sporting friends are there who have seen a rail, or sora, in the month of May?" As I have never seen in May alive it might be unnecessary for me to reply. While out in English snipe at the head of Barnegat Bay, N. J., April 28th, 1874, I more properly the dog) came across two sora rail (*Porzana Carolina*), of which I shot and now have in my collection. It was in fine plumage, but very thin and rather under size. I also noticed that day two Virginia rail (*Rallus Virginianus*). As an instance showing how close the birds lie, I will state that the dog, coming to a point on one, my companion got so near as to thrust his hand forward, endeavoring to pick the bird, but failed. The dog seeming to comprehend the situation, jumped forward and caught it in its mouth. The bird was in good shape and perfect condition. C. H. EAGLE.

THE EUROPEAN QUAIL.

BREMEN, Germany, May 8, 1874.

FOR FOREST AND STREAM:—

Finsch, the Curator of the Zoological Museum at Bremen, informs me that the migrating quail are found from the Cape of Good Hope to northern Sweden. It is found in England, but not in Scotland. They are caught in Italy in immense quantities, and could be procured in numbers only there. These birds, though not much sought after in place—indeed they are not plenty hereabouts—are much esteemed as a food, and the South Germans prize them as cage birds on account of the pleasant notes they sing. Dr. Finsch, who is a man of varied culture and scholarship, as well as of great reputation as a naturalist, tells me that, in his opinion, these quail would probably be a great acquisition to our country, chiefly as they would carry nothing of Bob White into colder Yankee land.

Mohr, the great geographer and African traveller, as well as a sportsman, who has killed almost all game, from the elephant to the hippopotamus down, tells me these birds afford good sport, as they are valuable game birds.

He, in New York, could procure them. Is not the experiment worth the making? Yours truly, M. GOLDSMITH.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS, }
NEW YORK, May 31, 1874. }

Animals received at Central Park Menagerie for the week ending 30, 1874:

Two yellow-haired Porcupines, *Erethizon epixanthus*. Hab. Western States. And.

Wild Cat, *Lynx rufus*. Captured at Mussel Shell River, Montana. Presented by Major General G. A. Custer, U. S. A.

Purple Gallinule, *Gallinula martinica*. Flew on board of vessel from St. Paul, Fla. Presented by Mr. Edward McCoull.

Mottled Owl, *Scops asio*. Presented by Mr. F. S. Webster.

W. B. CONKLIN.

The wild cat (*Lynx rufus*) mentioned above, presented by General Custer, is now, we trust, at the end of his travels. This lively and pug-nacious animal seems to have given no end of trouble. At St. Paul's he had to have cleaned out a whole express company's office, having been in bonds. Attempts were made to chloroform his catship, but he refused to be soothed by anesthetics. At last the cat jumped into a box of an expressman was smart enough to clap a board on it, and wise enough to sit on the improvised cover of the make-shift cage. The *Paul Press*, which gives an amusing account of the chase and the cat's behavior, concludes as follows: "The gentlemen who participated in the adventure of yesterday, hope that General Custer will not ship more Montana beasts to friends at the east, believing that this incident is enough to give the cat a name abroad, and to gratify any curiosity as to what a wild cat will do when driven to extremities or quarters."

Fish Culture.

Journal is the Official Organ of the Fish Culturists' Association.

CALIFORNIA SALMON.

CHARLESTON, N. H., May 28, 1874.

FOR FOREST AND STREAM:—

I beg leave to enclose you a letter from Seth Green, relating to the extraordinary rate of growth of the California salmon.

ROCHESTER, May 23, 1874.

DEAR STONE:—Our California salmon hatched this spring, are nearly as long as the Bucksport salmon one year old. I think in three months they will be larger than the Bucksport's. They beat all the fish for growing I have had anything to do with.

SETH GREEN.

In confirmation of the above letter, I may add that Mr. H. C. Donaldson told me that he had caught two California salmon in Lake Champlain this spring measuring 5 feet in length. They must have been part of the lot landed in the tributaries of the Lake in January, and the result is certainly astonishing. LIVINGSTON STONE.

The California aquarium car, which is to make the trip this season with a load of living fish, will be shipped by the Michigan Central Railroad. It is a baggage car forty feet long, with a broad tread, air brake, and platform, which will qualify it for travelling with the fastest passenger trains. It will be fitted up as an aquarium car at Charlestown, N. H., and will leave that point for the Pacific coast very soon.

M. C. Edmunds, State fish commissioner of Vermont, has just placed 75,000 young salmon, all in good condition, on the Lamotte River, near Georgia station, and will place about the same number in the Winooski River.

Henry M. Stanley, of Dixfield, fish commissioner of Maine, has a hatching house under his personal supervision, which is doing finely. He has about 100,000 young salmon, which he will soon turn into the Androscoggin, about 2,000 land locked salmon for the lakes at the

head waters of that river. It is the intention of the commissioners to thoroughly stock our lakes and rivers with these valuable fish, and with protective fishing laws we may reasonably hope to have an abundance of them in the future.

—The largest haul of shad which has been made in Taunton River for twenty years, was taken Monday, May 4th, by Obadiah Buffington and his men, at the Col. Perry fishing ground, Dighton. One hundred and seventy of these shad weighed 530 pounds.

—Salmon, shad, and alewives are beginning to make their appearance in the vicinity of Castine, Maine. George Devereux caught in his weir here a noble salmon, weighing 27½ pounds, on the 6th. It was sent by steamer to Boston for market.

—For some reason or other no shad have passed the Columbia dam, on the Susquehanna River this year, although the river has received the especial attention of those persons appointed to restocking it, and while other rivers, with scarcely an exception, exhibit in their increase of fish the success of the effort of the fish commissioners. The default at the Columbia dam is a source of much disappointment to the Harrisburghers and other adjacent dwellers, not to say indignation, and the reasons are very unreservedly attributed by the local press either to the imperfect construction of the fishway over the dam, or the negligence of the commissioners in preventing the setting of nets and seines by Columbia fishermen below the dam, whereby not a single fish has been permitted to pass. The Harrisburgh Patriot says:—

"The probability is that if this fishway has been constructed in strict accordance with the report it is a complete failure. But there is yet time before the season is over to make the test that was promised by the commissioners. Since the present commissioners have grossly neglected their duty and the interests of the public let them immediately resign, and enable the governor to appoint others who will enforce the law. Water bailiffs can then be appointed who do not reside at Columbia, and whose interest will correspond with their duty in clearing away the obstructions and giving the fish free passage up the river. If it then be demonstrated that this contrivance is a failure, no more should be constructed at public expense, and the appropriations from the treasury should at once cease. A warrant for not another dollar should be issued. This important work can then be commenced anew under more rational and less selfish counsels. The people living on the Susquehanna, who have lost all patience with the petty expedients that have been adopted to prevent success, will not rest until the shad fisheries are as abundant and as profitable from its mouth to its upper waters as they were forty years ago. Those who have been demonstrating 'How Not to Do It' must give way to men of science and experience who can and will."

To us the difficulty seems to rest on local jealousies and rival interests, and to be but a repetition of the history of the Holyoke dam contest. We should like to hear Messrs. Reeder & Co.'s version of the case.

—Hackensack River was last week stocked with Penobscot salmon, California black bass, and salmon trout. The river was thoroughly inspected, and the best spots selected for breeding purposes. If people will now only wait patiently for three years this river will be filled with these kinds of fish, affording an abundant supply of cheap food, as well as furnishing attractive sport. No persons are allowed to catch, by hook or net, any of the above mentioned species of fish for three years under a penalty of heavy fines and imprisonment. It is not the intention to stop shad fishing, but when salmon, salmon trout, or black bass are caught in the net they must be put back into the river, or the penalty will be imposed.

Governor Parker is anxious that those who own ponds, or who have streams of considerable size passing through farms, will take measures to procure fishes to stock the waters. We are informed that in a few weeks there will be a supply of black bass at the hatching house in addition to trout, salmon, and salmon trout.

At a late meeting of the New Jersey commissioners of fisheries, arrangements were made for the distribution of nearly a quarter of a million fishes. Of these, trout, salmon, and salmon trout are now in the State hatching house of Bloomsbury. Application for fishes should be made to the commissioners at once, as first come first served is the rule. —*Newark Courier*.

—What a huge maw great London town must have. In 1870, by rail and by water, there came to London 118,402 tons of fish; in 1871, 117,476 tons; in 1872, 99,868 tons; in 1873, 118,337 tons. The railroads bring about one third more than the vessels. As to salmon, in the week ending May 9th, in 1873, 872 boxes of salmon came to Billingsgate; this year, 1,171 boxes.

THE USES OF AMMONIA.—Ammonia, or, as people call it, "spirits of hartshorn," is a powerful alkali, and dissolves grease and dirt with great ease. For washing paint, put a tablespoonful in a quart of moderately hot water, dip in a flannel cloth, and then wipe off the woodwork; no scrubbing will be necessary. For taking greasy spots from any fabric, use the ammonia nearly pure, then lay white blotting paper over the spot and iron it lightly. In washing lace, put about twelve drops in a pint of warm suds. To clean silver, mix two teaspoonfuls of ammonia in a quart of hot suds; put in your silverware and wash, using an old nail brush or tooth brush for the purpose. For cleaning hair brushes, etc., simply shake the brushes up and down in a mixture of one tablespoonful of ammonia to one pint of hot water; when they are cleansed rinse them in cold water, and stand them in a hot place to dry. For washing finger marks from looking glasses or windows, put a few drops of ammonia on a moist rag and make quick work of it. If you wish your house plants to flourish put a few drops of the spirits into every pint of water used in watering. A teaspoonful will add much to the refreshing effects of the bath. Nothing is better than ammonia water for cleansing the hair. In every case rinse off the ammonia with clear water. To which we would only add, that for removing grease spots a mixture of equal parts of ammonia and alcohol is better than alcohol alone; and for taking out the red stains produced by the strong acids in blue and black cloths there is nothing better than ammonia.

Woodland, Lawn and Garden.

HOW TO MAKE A ROSE GARDEN.

"Then took the generous host
A basket filled with roses. Every guest
Cried, 'Give me roses!' And he thus addressed
His words to all: 'He who exalts them most
In song, he only shall the roses wear.'
Then sang a guest: 'The roses' cheeks are fair;
It crowns the purple bowl, and no one knows
If the rose colors it, or it the rose.'
And sang another: 'Crimson its hue,
And on its breast the morning's crystal dew
Is changed to rubies.'
Then Hassan said: 'The rose I sang
Is either pale or red; its buds are lips
Preparing for a kiss; its open flowers
Are like the blush of bliss
On lover's cheeks; the thorns its armor are,
And in its centre shines a golden star,
As on a favorite's a sequin glows—
And thus the garden's favorite is the rose.'
"The master from his open basket shook
The roses on my head."

BAYARD TAYLOR.

IN answer to quite a number of letters from our lady friends, who have been interested readers of the articles upon "city gardens," etc., and who are desirous of hearing from us on the subject of garden culture of the rose, we are quite happy to comply with their request, and would refer them to the FOREST AND STREAM for further instructions, thanking them for their good opinion as expressed in their good wishes and letters of inquiry upon the subject of roses, rose culture, etc.

First, the subject of soils best adapted for the successful cultivation of these very beautiful flowers is to be fully and practically considered and studied. The old idea of "a rose growing any and everywhere" is an erroneous one, and all those cultivators who begin with this idea will very soon find that although many kinds of roses will, like every other green thing, strive to live under disadvantages, yet more will die outright than live.

You have determined to try and produce a fine rose garden, you say, and you will be able to accomplish this undertaking successfully if you carefully follow the directions herein laid down. First, the soil. The best soil for rose cultivation—and the soil we have always observed that the rose thrives best upon—is formed from the base of a strong rich loam, composed of well and thoroughly decomposed vegetable mould (which we call compost*) and cow and sheep-house manure, the older and more decayed the better. Never use in your composition for roses new and strawy manures, more particularly from the horse stable. You can, if desirable, form your rose manure for the succeeding year's use very easily if you note the foregoing rules, viz:—Make a good bin by driving four posts in some convenient place in the garden, forming a ten foot square space. Nail boards on the side of the same as high as you please, and into this bin deposit your charcoal dust, sweepings, and vegetable garbage in general, such as is found about every house. You will thus find you are making an accumulation of a rich and valuable compost, to which, at the time of planting, you add the materials that make your rose soil very rich. You can rarely make any soil too rich for roses. In very heavy, loamy soils, you will find two parts of clean silver, or beach sand, will much improve and modify your soil. In the preparation of the rose bed I always prefer the "old Scotch method," as it is called; that of thoroughly trenching the rose plat, be it large or small. This should be done by first spreading the before named soil or compost six inches deep over the rose garden, always, if of good size, and with a flat tined garden fork, thoroughly digging and incorporating the same with the garden loam. Let this bed be eighteen inches to two feet deep. You are carefully to guard against giving your rose bushes a poor, meagre soil. If you do so you will learn it only when too late, for almost every rose, when planted in good soil, will yield you a fine, fully developed double rose, but in a feeble, meagre, starved soil you have yellow leaves, shrivelled twigs, and single roses. I have seen most unlooked for results from bad rose culture, and it is a folly most unmitigated yet frequently committed by many of our fair rose culturists, who must break themselves of this habit if they would be successful. It costs no more labor, and but little more care, to cultivate to perfection the rarest varieties than it does to produce a handful of starvelings, unsightly and worthless. Keep this fact well in mind all ye who love to look upon, to pluck, or to wear a bouquet of splendid fragrance.

Some will find but little room for what may be called liberal or extensive trenching. Such as find it necessary to plant roses upon lawns in small apertures, cut in the green sod for this purpose, should be careful to dig deeply and manure highly, not omitting to add pulverized charcoal to their rose compost. Well rotted soil, if old and mellow, is an admirable addition to rose culture, and I have grown remarkably fine roses of the very choicest and most tender kinds upon a basis of rotten sod. The sod from an old pasture yields you a very fine, rich mould, and you can dig it up and with a knife slice from it an inch of just as good soil as can be had. If inclined to be heavy add sand and charcoal and old rotted cow dung, and plant your roses upon this, in the ground or in well drained crocks, and you will find that you will have as good a show of roses as any of your neighbors. If you do not, then our own oft-tried experience will be found at fault. You will therefore have

*This compost heap is very valuable to every one who would have good rose bushes. It is made from sod clippings, sweepings of the house, and such general accumulations of the house and yard as may be found in every really neat family—known in household words as the "refuse heap."

learned from this paper this one fact, which should be a valuable consideration to you, viz:—that under all circumstance, and in all cases, if you would have good roses you must have an appropriate soil upon which to grow them. You can change the nature of your soil by the addition of the necessary agents, as they lay all around you, only awaiting an easy chemical process called agricultural “chemical combinations.”

As some of our lady friends may be desirous of planting out at once some choice rose tree or root, I will make a suggestion or two, upon which they can act until a more full and complete account of our manner of rose planting appears, which will be continued in our next paper. If you have any choice plants of the rose tree kind—roses grafted upon tall stems, such as make a bouquet of flowers at some two feet or more from the ground—you can use a special manure for these, composed of an admixture which we have used with good success, and which we have christened “rose fertilizer,” which is made as follows:—One part of the best Peruvian guano, three parts of charred sod, or turf burned, and six parts of cow dung, the older the better, and one part of pulverized charcoal or dust, mixed intimately. These you can further stimulate by watering with a fertilizer made from one eighth of a pound of guano, to which add four gallons of water; apply at night from a watering pot.

Examine your rose roots with care before you plant them out, and cut every rose bruised root, or twig above the bruise; be very careful not to put into the ground any imperfectly trimmed plant; make smooth every jagged end, any split, or any imperfection. You will then place the plant in the cavity or hole prepared for it, being particular to spread out the small rootlets, and carefully incorporate the prepared fertilizer by gently shaking the same about the plant until you have filled up the earth about it firmly and well. This being done you have only to label your plant with its name and await with patience the hour of blossoming.

THE INDIA RUBBER TREE.—Travellers from the Okechobee have reported that they found growing there the tree that produces the India rubber. This statement has been published in several newspapers, both here and at the north. We have been shown some pieces of the wood from this so-called rubber tree brought from the lake, and find that it is only the *parasite fig*, that is so common in the West Indies. The tree bears a small species of fig about the size of a small filbert, which are eaten by birds. The seeds are thus carried about, and if lodged in a rotten part of a large tree germinate there, and eventually it hugs the tree in its embrace, killing it, and completely enveloping it and sending out roots that reach the ground in all directions around it. In the West Indies, the gigantic ceiba or cottonwood tree is often seen with this fig growing out of it, which soon kills it. On the tree being chopped with a hatchet a white milk exudes, which, on exposure to the air, becomes sticky, and on this account has been mistaken by travellers for the India rubber. The gentleman who showed us the specimen brought it from the lake himself, and was under the idea that it was the real India rubber, until we gave him a description of the tree, when he was convinced, and admitted our description as being correct.—*Florida Agriculturist*.

THE POTTERY TREE.—Among the many vegetable products of Brazil, the pottery tree of Para is not the least worthy of note. This tree, the *Moquilea utilis* of botanists, attains a height of 100 feet up to the lowest branches. The stem is very slender, seldom much exceeding one foot in diameter at the base. The wood is very hard, and contains a very large amount of silica—not so much, however, as the bark, which is largely employed as a source of silica in the manufacture of pottery. In preparing the bark for the potter's use, it is first burned, and the residue is then pulverized and mixed with clay in varying proportions. With an equal quantity of the two ingredients a superior quality of ware is produced. It is very durable, and will bear almost any amount of heat. The natives employ it for all manner of culinary purposes. When fresh, the bark cuts like soft sandstone, and the presence of the silex may be readily ascertained by grinding a piece of the bark between the teeth. When dry it is generally brittle, though sometimes hard to break. After being burned, if of good quality, it cannot be broken up between the fingers, a pestle being required to crush it.

How THEY DROP SHOT.—A reporter of the Baltimore *American* thus describes one of the many processes of making shot in one of the shot towers of that city:—

"One of the 'secrets' of the manufacture is the mixing of the lead with a certain proportion of a combination of mineral substances called 'temper.' The 'temper' is fused with the lead, and gives the molten metal that consistency which makes it drop. If it were not for the 'temper' the lead would be moulded by the sieve, and would form little pencils instead of round shot. When 'BB' shot, for instance, are to be made, the lead is poured into a pan perforated with holes corresponding to that size. The little pellets come pouring down in a continuous shower and fall into a tank filled with water on the ground floor. In their descent of two hundred feet they become perfect spheres, firm and dense, and they are tolerably cool when they strike the water, although the swift concussions make the tank foam and bubble as if the water was boiling furiously. The shot must fall in water, for if they would strike any firm substance they would be flattened and knocked out of shape. To get the little pellets perfectly dry after they have been in the 'well,' is the most difficult and troublesome process of the whole manufacture. An elevator with small buckets (very much like those used in flour mills) carries the shot up, as fast as they reach the bottom of the 'well,' and deposits them in a box sixty feet above the first floor. The water drips from the buckets as they go up, and not much is poured into the receiver above, although it is intended to be a sort of dripping machine. From this receiver the shot runs down a spout into a drying pan, which greatly resembles a gigantic shoe, made of sheet iron. The pan rests at an angle which permits the wet shot to roll slowly down to the chamber below, and the pellets become perfectly dry as they pass over the warm sheet-iron.

Rational Pastimes.

Secretaries and friends of Athletic, Base-Ball, Cricket and other outdoor Clubs will kindly mail their contributions not later than Monday in each week.

RULES FOR ARCHERY.

NUMBER TWO.

THESE must of necessity exist a certain proportion between the weight of the bow and arrow. In England, the usage is to call the weight of the arrows after the coins current when bows and arrows served in England for arms. For instance ladies' arrows of twenty-five inches in length, are said to weigh from two shillings and threepence to three shillings and threepence. For a gentleman's bow of fifty pounds, and above that weight, and six feet long, arrows should be twenty-eight inches long, weighing from four shillings and sixpence to five shillings and sixpence; for bows under fifty pounds, and not exceeding five feet ten inches in length, arrows of twenty-eight inches are about of the right length and should weigh from three shillings and sixpence to four shillings and sixpence each.

No rule, however, can be made for regulating the length and weight of arrows; twenty-eight inches are long enough if drawn up to the pile, for one hundred yards, the longest distance now usually shot; and a bow of fifty pounds will cast an arrow that length, weighing four snillings, to the opposite target with little elevation. The same observation applies to bows of less weight; a three shillings and ninepenny arrow of twenty-eight inches is quite capable of being shot one hundred yards from a forty-eight pound bow, if drawn up as every arrow should be.

Arrows are now generally made of red deal. It is indispensable that the wood should be thoroughly seasoned, cut with the grain, and free from knots or curl.—The best arrows are footed with some hard wood, which not only better balances, but, by increasing their strength, renders them less likely to break off just below the *pile* (as the head of the arrow is called), and also prevents their liability to cast.

Some persons, after shooting, place their bows with the arrows *leaning agaist* the wall or corner of a room; but this is objectionable, as their own weight is of itself sufficient to warp them. Both should be placed in a perpendicular or horizontal position, the bow should be hung up, and the arrows put in a tin case or cover.

Carc must be taken not to shoot when the grass is wet; if the moisture does not cause the feathers to come off, which it most probably will, or at all events loosen them, and the foot of the arrow, which penetrates the ground, get so saturated that it is very considerably increased in weight, and that weight not distributed throughout the arrow, but entirely at one end.

As the flight of an arrow depends materially on the feathers, be particularly careful and observant of these appendages; if a feather is damaged the arrow becomes most uncertain in its flight.

The grass should be cut very close for some distance around the targets, otherwise the arrows will be very apt to *snake*; by *snaking* is meant that arrows will be so concealed under the grass as to elude even a practised eye, and may be trodden on, and thereby completely spoiled.

When an arrow has *enaked* never attempt to draw it back (which would injure the feathers), but with the point of another arrow clear away the grass which is over the feathers and as much more as you conveniently can; the arrow may then be easily removed.

Every archer ought to have his mark painted on that part of his arrows which is just beyond the commencement of the feathers; as without this distinguishing mark, when several are shooting, confusion arises from the archer not knowing his own arrows before he draws them out of the ground. In doing this great care should be taken; place your hand under the arrow with the *outside joints of your fingers upon the ground*, and as you draw it out, turn it round with the thumb and fore-finger; if in the target, take hold of it close to the painted circle in which it may be with the *knuckles upwards*, and turn it round as you draw it out, at the same time pressing against the target with the other hand.

The *nock* of the arrow should be rather tight than otherwise on the string; at all events it should fit easily, not requiring any force to put it on, as that would endanger the horn splitting.

Arrows for the same distance should always be of the same length and weight; in short, exactly alike in all essential particulars; when this is not attended to, with the same elevation, there must of necessity be a difference in the flight of an arrow so varying.

All arrows have three feathers placed in a triangle longitudinally on that part called the *steele*, just beyond the *barb* which is inserted for the preservation of the nock.

horn which is inserted for the preservation of the nock. A very little experience will suffice to show, that of the two only ways in which an arrow can possibly be nocked, that is the proper one which brings the feather upon the horn (and which is generally of a different color to the other two) on the upper side of the string. Try the other way, and you will find that the *cock feather*, as it is termed, will rub against the bow when it is discharged, and must consequently cause an aberration in its direction, independent of the injury it must sustain.

(To be continued.)

—The Prospect Park Club played a match at the park on May 30th, between married and single eievens, the score of which was as follows:

MARRIED.		SINGLE.	
Dexter retired	39	Ronaldson ct Dexter b Stevenson	4
McCauley run out	0	Jarvis ct Stevenson b Dexter	2

------------	----	------------	----

The president of the club has appointed Messrs. Chadwick, Woodhouse and Dexter the Executive Committee of the club.

After the match croquet and archery was indulged in

by the ladies, and as night fell upon the scene artificial light was supplied, so that there might not be a stoppage of the festivities. Around the inclosure were hung numerous Chinese lanterns of varied colors, and coupled with the illumination of the club-house, gave the whole affair quite a picturesqueness which was agreeable to behold from a distance, but far more enjoyable within the prescribed precincts. The club-house and a portion of the pavilion were fitted up for dancing purposes, and to numerous waltzes, galops, quadrilles, and redowas, performed by the Marine Band, the guests enjoyed themselves until a late hour.

The fete was arranged under the charge of the following committee: F. Dickinson Sergeant, John B. Large, Charles A. Newhall, William Welsh, Jr., William Rotch Wister, Samuel Welsh, Jr., C. Stuart Patterson, Charles E. Cadwalader, Ellicott Fisher, Fred C. Newhall, W. W. Montgomery, Rowland Evans, Thomas McKean, James Duval Rodney, Roberts Vaux, Albert A. Outerbridge, Victor A. Sartori, Jr., Sutherland Law, James Large, R. Loper Baird, John C. Sims, Jr.

[We kindly acknowledge the courtesies extended to us by the secretary and members of the Philadelphia and Young America Cricket Clubs.—ED.]

—The St. George Club of this city visited the Germantown Club on May 30th, and though they took a strong team with them, the Philadelphia cricketers came near defeating them in one inning, the Germantown eleven having but a dozen runs to get to win in one inning, when "time" was called, and the game ended. The score gives the figures:

—The second annual cricket *fete* held on the Germantown cricket field, near Philadelphia, came off on May 28, and the weather proving very auspicious, the whole affair turned out to be even more successful than the first *fete*. The event of the *fete* was the cricket match Young America vs. Germantown. It was a one day's game only, and the first innings declared the Young Americas winners. The second innings was commenced but not finished.

CRICKET IN ST. LOUIS.

ST. LOUIS, May, 1874.

EDITOR FOREST AND STREAM:—

I send you the first match of the season between the St. Louis and St. George elevens. The two clubs were physically below par, the day very hot, not less than 85 degrees, and the heat coming on so suddenly the men were badly wilted before the first inning of the St. George's was through. The match established one fact as stated in "Bill Stumps" article of a few weeks ago, that the two clubs were materially stronger than last year. I think I may be excused from the imputation of local pride when I say there is cricket material in St. Louis equal to any city on this continent.

The bowling of Sharpe and Miller opened poorly, but improved as the inning progressed. The fielding of the St. Louis eleven was above the average, and the game looked well for St. Louis until the bowling of Webb showed that every ball was on the spot. Mordaunt bowled very effectively, but his bowling was more conducive of catches than displacing balls. Passing one of the stands mostly occupied by the male sex, I heard a remark from an elderly individual as follows: "I am from Kent, sir, and in that country cricket is played as it should be played, and I will venture to assert that few better elevens ever played in that country than the gentlemen now in the field; all they want is practice." I think myself the veteran was not far out of the way, as although there was occasionally poor fielding, the bowling on both sides was good; in fact so good that maiden overs were the order of the day, and each player seemed over cautious. Jeffries, of the St. Louis, as wicket keeper (which position he filled with the United Eleven of last fall), was up to his usual excellence, but he had a match in A. Rea, of the St. George's, whose play both behind the wicket and at the bat elicited the highest praise. Dale of the St. George's, who made the largest score of last season, did but little, whilst Richardson sustained his well earned reputation. Sharp's "barn door defense" proved but a *cobweb* against the St. George's Webb's bowling. It is to be regretted that the indisposition of Miller prevented his playing out his inning, as he certainly showed very fine batting. What he would do in good form remains to be seen. In conclusion, I do not doubt that either club will be in shape this summer to beat any eleven in the United States or Canada; but after the heavy expense of the eastern tour of last fall, I do not think either of the St. Louis clubs will feel warranted in going east this season. I have not, heretofore noticed the circular of Mr. Satterthwaite, of the St. George's of New York. The standing here, in a business point of view, of Temple *alias* Billington, let almost every friend of cricket into the same scrape as Mr. S. complains of, and the secretary of the St. George's Club took immediate action in notifying secretaries of clubs with which

The United Eleven played last fall of the rascality of their quondam captain. Are we individually "our brother's keeper?" The St. Louis or St. George's Clubs will be glad to hear from eastern clubs desirous of trying their prowess with the western boys.

The following is the score:

Umpires—Messrs. Dr. Bray and H. H. Swinseal. Scorers, Messrs. H. S. Parker and T. Gillman.

—The record for May's cricketers in England shows an unusual number of "centuries"—scores of a hundred runs—for the leading experts. Thus far the list is as follows:

W. H. Game, of Oriel club, not out.....	234
D. Q. Steel, of Uppingham school, not out.....	184
E. K. Hodson, of Magpie club.....	163
C. W. Bails, of Chrystal Palace club, not out.....	157
W. S. Patterson, of Cambridge.....	147
F. M. Buckland, of Oxford.....	136
D. R. Hunter, of Cambridge.....	115
H. Roland, of Merchiston.....	109
P. M. Kidd, of Blackheath.....	109
J. Feavings, of Clifton.....	109
F. Townsend.....	108
J. Jackson, of Cambridge.....	107
S. C. Newton, of Corpus Christi College.....	106
A. P. Lucas, of Uppingham.....	104
W. J. Ford, of St. John's College.....	100
Rev. S. C. Vaules, of Rossall.....	100
W. Fairbanks, of Cambridge.....	100

—The question of amateur cricketers being paid is thus referred to in a communication to the Marylebone Club from Mr. Henry Holden, who says: "I think it high time that the question as to what constitutes an amateur and what a professional cricketer should be brought forward and settled. I was under the impression that an amateur was one who played for amusement, a professional one who played for profit. Year after year I see Mr. William Gilbert Grace playing for the Gentlemen against the Players, although it is well known that he is as regularly paid as any professional in the kingdom, the only difference being that he is paid larger sums for each match. This is wrong in principle and practice; the Players of England feel very strongly on this subject, and I am now expressing the opinion of a very great majority of them. I had intended to present a protest from them, and had obtained the signatures of some of the principal players of Yorkshire and Nottinghamshire, but, the time being short, I found it impossible to send round to all, and, therefore, thought it the better plan to write and protest, as I now do, against any person who is paid for playing in any match being allowed to play as a Gentleman against the Players."

No player—cricketer or base ball player—can be regarded as an amateur who in any way is paid for his services. Grace is a professional as much as Lilly White.

—A murder was committed at a ball match on May 20 in Clark County, Georgia, a player named Pink Price hitting Luther Thatcher on the head with a bat and killing him instantly. Both were under 20 years of age.

—The professional nines are this season playing base ball almost to perfection, as the remarkably small scores which have marked the championship contests fully prove. The record of the arena from May 21st to 31st is one never be-

fore equalled in the annals of base ball. We quote the total scores below:

May 21, Philadelphia vs. Hartford, at Philadelphia,	6—4
" 22, Boston vs. Atlantic, at Brooklyn,	6—2
" 22, Baltimore vs. Hartford, at Baltimore,	9—7
" 23, Atlantic vs. Boston, at Boston,	9—3
" 23, Mutual vs. Chicago, at Chicago,	7—4
" 23, Athletic vs. Hartford, at Philadelphia,	12—4
" 26, Atlantic vs. Boston, at Boston,	6—2
" 27, Boston vs. Mutual, at Boston,	9—5
" 27, Atlantic vs. Yale, at New Haven,	8—3
" 27, Chicago vs. Hartford, at Chicago,	9—3
" 29, Boston vs. Philadelphia, at Boston,	8—0
" 30, " " " " " "	4—3
" 30, Mutual vs. Atlantic, at Brooklyn,	2—0
" 30, Baltimore vs. Athletic, at Baltimore, 7 to 6.	
" 30, Chicago vs. Hartford, at Chicago, 14 to 8.	

This gives an average in the fifteen games of but 7 runs and 11 over for the winning nines, and but 3 and 9 over for the losing, an average in two weeks' play never before approached. Such results prove conclusively not only how favorably for good play the new rules are working, but also how advantageous it is in developing the beauties of the game to play with an elastic ball. The majority of these games were played with a Mahn "S" ball, and the small score was made with a Ross ball.

—The professional championship games played since our last issue were as follows:

May 26, Atlantic vs. Boston, at Boston, 6 to 2.	
" 27, Boston vs. Mutual, at Boston, 9 to 5.	
" 27, Chicago vs. Hartford, at Chicago, 9 to 3.	
" 29, Boston vs. Philadelphia, at Boston, 8 to 0.	
" 30, Boston vs. Philadelphia, at Boston, 4 to 3.	
" 30, Baltimore vs. Athletic, at Baltimore, 7 to 6.	
" 30, Chicago vs. Hartford, at Chicago, 14 to 8.	
" 30, Mutual vs. Atlantic, at Brooklyn, 2 to 0.	
June 1, Philadelphia vs. Atlantic, at Brooklyn, 10 to 0.	
" 1, Athletic vs. Baltimore, at Philadelphia, 10 to 3.	

—The average of runs for the winning nines in the professional arena during April was 12, and the average for the losing nines 4. During May a marked improvement was exhibited, the average for the winning nines having been run down to 8, the smallest on record, while the losing side still kept to 4.

—The Chicago games to date in the professional arena include the following:

April 22, Philadelphia vs. Baltimore, at Baltimore, 13 to 0.	
May 13, Chicago vs. Athletic, at Chicago, 4 to 0.	
" 29, Boston vs. Philadelphia, at Boston, 8 to 0.	
" 30, Mutual vs. Atlantic, at Brooklyn, 2 to 0.	
June 1, Philadelphia vs. Atlantic, at Brooklyn, 10 to 0.	

The best played amateur games on record for May are as follows. We first give the games played by amateurs with professional nines.

May 6, Hartford vs. Yale, at New Haven, 6 to 4.	
" 27, Atlantic vs. Yale, at New Haven, 8 to 3.	
" 26, Easton vs. Princeton, at Princeton, 7 to 4.	
" 16, Pacific vs. Collins, at Philadelphia, 9 to 5.	
" Rothchilds vs. Field, at Hoboken, 8 to 7.	
Of games in which the winning nines exeed 9 runs to a match, the following are the best on record in May:	
May 2, Princeton vs. Zephyr, at Princeton, 10 to 2.	
" 2, Centennial vs. Gerard, at Philadelphia, 12 to 9.	
" 9, Yale vs. Fly Away, at New Haven, 15 to 5.	
" 8, Philadelphia vs. Princeton, at Princeton, 15 to 7.	
" 9, Nassau vs. Rosedale, at Brooklyn, 13 to 5.	
" 11, Waverly vs. Star, at Hoboken, 14 to 13.	
" 4, Pacific vs. Sheba, at Philadelphia, 12 to 2.	
" 6, Lafayette vs. Eureka, at Philadelphia, 11 to 6.	
" 13, Monumental vs. Echo, at Baltimore, 12 to 9.	
" 14, Creighton vs. Eagle, at Washington, 11 to 6.	
" 16, Germantown vs. Riverton, at Riverton, 10 to 2.	
" 16, West End vs. Modoc, at Philadelphia, 11 to 9.	
" 18, Collins vs. Easton, at Easton, 11 to 4.	

—Among other amateur games last week since May 25th were the following:

May 26, Easton vs. Princeton, at Princeton, 7 to 4.	
" 26, Mysterious vs. Star, at Wayne Station, Philadelphia, 19 to 15.	
" 27, Jasper vs. N. Y. University, at Manhattanville, 32 to 8.	
" 27, Chelsea vs. Amity, at Prospect Park, 21 to 1.	
" 27, Nassau vs. Athletic, at Prospect Park, 30 to 0.	
" 28, Jasper vs. Oriental, at Greenpoint, 19 to 10.	
" 28, Aldine vs. Unknown, at Philadelphia, 26 to 5.	
" 29, Pierce College vs. High School, at Philadelphia, 28 to 11.	

PRINCETON COLLEGE, June 1, 1874.

EDITOR FOREST AND STREAM:—

In your issue of May 28th I notice a remark to this effect, that "but few good games are now being played by our local amateur clubs, chiefly in consequence of their persisting in playing under the crude code of rules adopted at their late convention in this city—the objectionable feature of which code is the undue latitude given to wild pitching by the absurd rule introduced governing the delivery of the ball to the bat. By this rule pitchers are allowed to do just as they like almost, while the strikers are obliged to strike at every ball pitched over the bat." Probably had Mr. Chadwick the making of the rules for the amateur convention, we would have been as well suited as the professionals, for whom he has so kindly volunteered to legislate, and whose efforts have utterly failed to be appreciated. As the amateur rule for pitching now stands, the latitude in pitching is not nearly so broad as for the professionals, who have wides and balls. The rule at present is such that a good umpire is indispensable, and with one no better games can be witnessed. I notice he has taken particular pains to represent his side of the case pretty well in the citation of games and now let me quote for the benefit of showing the well working of the amateur rule governing the delivery of the ball to the bat.

Yale vs. Hartford 4 to 6; Yale vs. Atlantic 8 to 3; and of the games which have come immediately before my notice here at Princeton, some of the finest have been played under the new rules. Princeton vs. Zephyr, 10 to 2; Princeton vs. Philadelphia, 15 to 7; Princeton vs. Easton, 4 to 7; Princeton vs. Montague, 13 to 9; and of the class matches May 21, '74 vs. '76, 3 to 7; May 27, '77 vs. "Press" School, 7 to 6; May 28, '74 vs. '76, 15 to 14.

Now I take it for granted that the other part of the country must be able to furnish games with equally well marked scores, the highest scoring only 15 runs.

Of course where two clubs are very much mismatched large scores on one side may be looked for. I am sorry to see that much as Mr. Chadwick professes the well being and success of the amateurs, he is everlastingly trying to find some fault with them and their's, and he appears to me in his relations to them to be "straining at a gnat," and with the professionals "to be swallowing a camel."

A fine game was played on Tuesday, May 25th, with the Eastons. The college boys never played a better fielding game, but their handling of the ash was weak. A streak of good fortune favored the Eastons in the 5th innings where they scored four runs by safe hitting, only then and for a moment completely collaring Manus' pitching.

Score:—
Princeton—1, 0, 3, 0, 0, 0, 0, 0, 0—4.
Easton—2, 0, 0, 0, 4, 1, 0, 0, 0—7.
Umpire Mr. Bausman, of Lafayette College.
On Saturday, May 30th, the Montagues of Brooklyn visited Princeton and were defeated as follows:—
Montagues—0, 4, 0, 0, 0, 1, 3, 1, 0—9.
Princeton—0, 0, 0, 5, 3, 2, 1, 0, 2—13.
Umpire, Mr. Taylor, of Jersey City.

CHAMPION.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, trails, species governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

BUENA VENTURA. Flint, Mich.—Yours received with thanks. Will print at earliest opportunity.

P., Boston.—Can you supply Nos. 1, 11, 17, 19, vol. one, to a subscriber to complete his file for binding? Ans. Yes.

OLD PIGEON SHOOTER, New York.—You do not give your name. Note initials at the head of this column.

R. W. A., New Haven.—Write to Doc Stuart, Bloomingburgh, Sullivan county, N. Y.

MASTER LEWIS, Alleghany City.—Original copy of Walton excessively difficult to procure and worth its weight about thrice in gold. See article in FOREST AND STREAM of January 22, 1874.

QUEBEC.—Will United States money pass current in Canada, vicinity of Quebec, or will it be necessary to take English money? Ans. In Quebec, yes; in the vicinity, no. You can exchange greenbacks for silver in Quebec at any place.

SECRETARY.—The builders of bass wood (not cedar) canoes in Ontario, Canada, are, Wm. English of Peterboro, and — Gordon of North Dour. Shoe packs are not made in Peterboro.

H. R., Duluth.—We have sent a portion of your letter to the gentleman mentioned. He is perfectly reliable and will answer you in a day or two.

E. B. J., Long Branch.—1. Would a cross between a setter dog and a pointer have hair between his toes, and what do you think of the cross? Ans. See FOREST AND STREAM May 21. 2d. If a fine pointer bitch had pups by a coach dog, would they be worth anything as sporting dogs; would they not show their father plainly? Ans. They would be utterly worthless. 3d. Are not pointers often spotted? Ans. Yes.

C. W. B., Newark.—Having had a discussion when close season for trout commences in the States of New York, Pennsylvania and New Jersey, we agreed to submit the question to your decision? Ans. New York, September 15th to March 15th; New Jersey, August 15th to April 1st, recently changed by legislature from September 1st to March 1st; Pennsylvania, August 15th to April 1st.

WOODCOCK.—We have inquired, and learn from B. A. Hoopes, Esq., President of the Philadelphia Sportsmen's Club, that at the close of the session of the Pennsylvania Legislature the Governor signed a bill which fixes the time for shooting woodcock at July 1st this year, so that this shooting season is from July 1st to January 1st. Snipe shooting is also prohibited after May 1st.

FISHERMAN'S LUCK, Haverstraw.—We do not pin much faith on any special varieties of artificial flies as being infallible at certain seasons, but give the following list for June, as named by the Boston fly-tyers, Messrs. Bradford & Anthony: Green drake, gray drake, orange dun, coachman, scarlet ibis, dark mackerel, professor. See FOREST AND STREAM, page 125, No. 8.

N. M., New Haven.—I think of spending a month, after the middle of August, in the Maine woods, fishing, &c. Can you tell me through your columns the price of one guide for two, what our other expenses will be, what sport we can have, and from what books, besides Thoreau's, we can get information? Ans. Hallock's "Fishing Tourist" will give you every information necessary.

SUFFERER.—Can you give us a cure for the disagreeable effects of the Poison Ivy? A sufferer wants some relief from a punishment he is sure to receive whenever he even gets in the neighborhood of this pestiferous plant? Ans. Steep your legs and feet in strong pork brine. This is the farmer's old recipe. To some persons ivy is positively innocuous, while to others its effects are really dreadful. Do any of our readers know of a better recipe?

N. B., Philadelphia.—I have a muzzle-loading gun weighing about 10 pounds, barrels, 31 inches long and 11 bore. How much powder should I use for shooting 1½ ozs. of shot? I have used ¾ drachms of Dupont's No. 2, but it produces a very unpleasant recoil? Ans. Use a coarser grain of powder. What is a good kind of oil to use on a gun after cleaning? Ans. Try Riggs' Belmont oil and report. I have a setter pup that I will partly break myself. What is a good book that I can read on breaking and taking care of dogs? Ans. Stonehenge's "Shot Gun and Rifle."

CUSHMAN.—Will you kindly give me information as to the probable expense of a trip, say from Sault Ste. Marie to the Nepigon River in the Lake Superior region. I desire to know more particularly the cost of guides, canoes, transportation, &c.? Ans. Cost of round trip from Collingwood to Red Rock and return is \$35, gold, including meals and state room; time, eight days. Steamers also leave Buffalo, Cleveland, Chicago and Detroit two or three times a week for Gitchee Gumee, or Lake Superior. Don't know exact fare from the Sault to Red Rock, at mouth of Nepigon—eight dollars possibly. Guides and canoes \$2 per day.

H. A. S., Minneapolis.—Who is the person to write to at the mouth of the Nepigon River to make the necessary arrangements for a small trout party? Ans. Take Duluth steamer to Red Rock, Nepigon, where you will find everything provided at Hudson's Bay Co.'s Post, of best quality, excepting fishing tackle. They have suitable provisions, clothing, blankets, guides, canoes, and doubtless a finished, commodious sporting house, which was in an advanced stage of construction last year. It may be well to attempt to secure accommodations in advance, but the principle is "first come, first served," and the place is not likely to be overrun or drawn upon too largely, except as respects guides and canoes, of which there may be sufficient for two dozen gentlemen. Write to Robert Crawford, the company's agent, postmaster, &c. From Duluth to Red Rock 196 miles.

—Imagine the agony of a Richmond mother who has lost her infant when she says to its mate, "You, Jawrge Washington, quick 'splain yourself, chile—stop dat ar fool smile—whar you bin done wi' de baby?"

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUKATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832,]
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JUNE 4, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, June 5th.—Hartford vs. Mutual B. B. C. at Philadelphia—Cambridge City Agricultural Society, Cambridge, Ind.—Hampden Park Association, Springfield, Mass.—Great Falls Association, N. H.

SATURDAY, June 6th.—Hartford vs. Mutual B. B. C. at Brooklyn—Boston vs. Chicago B. B. C. at Chicago—Yale vs. Knickerbocker B. B. C. at New Haven—Harlem River Boat Club's practice day—Prospect Park Cricket Grounds, practice day—Jerome Park races, Fordham, N. Y.—Dorchester Yacht Club Regatta.

TUESDAY, June 9th.—Valley City Association, Grand Rapids, Mich.—Howard county Society, Kohomo, Ind.

WEDNESDAY, June 10th.—Match day, St. George's Cricket Club, Hoboken—Penn Yan Driving Park Association, N. Y.—Valley City Association, Grand Rapids, Mich.—Howard county Society, Kohomo, Ind.—Sullivan county Park Association, Claremont, N. H.—Boat race, Argonauta vs. Buffalo, on the Kill von Kull.

THURSDAY, June 11th.—Sullivan county Park Association, Claremont, N. H.—Penn Yan Driving Park Association, N. Y.—Valley City Association, Grand Rapids, Mich.—Howard county Society, Kohomo, Ind.

WOODCOCK ON TOAST.

A stern friend of protection of game writes to us something as follows:

New York, June 1.

EDITOR FOREST AND STREAM:—

On the occasion of the late Washington wedding, the menu, as printed on cream-colored silk, included Woodcock on Toast—decorated (vide New York Herald, May 22d). While the strict observance of the game laws throughout the country is of general interest, and as a matter of principle, woodcock, owing to its migratory nature, is a bird in which every sportsman North and South has a direct interest. Wrongfully killing woodcock makes us all losers, and by loud and indignant protests from all sections of the country, the practice of creating a demand for birds out of season must, in even the highest or the happiest of occasions, be censured.

Yours very truly,

GRUZ.

We perfectly agree with Gruz. General Grant, even on this auspicious event of the marriage of his daughter, ought not to have had "woodcock—decorated" at the nuptial feast. Of course the President is responsible for all the actions of his Cabinet, and we sincerely trust that, with Richardson and Sawyer, his *chef d'Hotel* and head cook will come in for a severe wiggling. We mail General Grant a copy of our close season.

ATHLETICS A LA MODE.

OUR American athletic season may now be said to have fairly commenced. In other countries, where the climate is less rigorous, where in winter the weather is less severe, and in summer the heat is less distressing, there are certain advantages for sport throughout the year. Our own rational exercises are in fact limited, with the exception of skating, to some six spring and summer months. When we do commence it may be safely stated that in the short period allowed us we do our best. Our columns give full evidence of the increasing zest our young men are taking in out-door amusements, and in the respective departments of FOREST AND STREAM may be found the full development of this season's yachting, rowing, cricketing, and base ball playing. Even that high and lofty portion of society, the club men, seem to have for the nonce, left their elegant lounges by the club mantle-piece, and are indulging in walking performances. Central Park for some time past at early morning, when usually visited by young ladies and children, seeking their constitutional walk, has had its walks occupied by certain stalwart gentlemen, who, by this time, are quite familiar with the quarter and half miles on the paths, and the restaurant keeper receives many orders over night from accomplished trainers for beef steaks undone, stale bread and English breakfast tea, which go to refresh the inner man of hungry pedestrians. Elegant athletics now declare that walking a mile in the nine or even ten minutes is a delightful excitement, when a month or so ago a lounging gait across the street was declared by them to "be a horrid bore," and they are not only surprised but delighted to find what an amount of "go" was in them.

We want to invoke one particular aid for this newer life, which our men have just discovered, which must, in time, make them stronger and better, both in body and mind, and that is, that our ladies, the mothers, wives, sisters, and sweethearts should encourage the *renaissance* of the athletic movement in the United States. The insipid, weak-strung, effeminate being of a time that is passed, could never have been a natural or even an acceptable creature. A woman wants a man to protect her when the time of danger may serve. Physical attributes in the age we live in, as in all ages, have and will assert their power. The material, the corporeal forces have their worth, and are better appreciated when in conjunction with the mental and intellectual faculties. May not a gentleman, in the true sense of the word, paint a picture well, or model a statue, or write a sonnet, or be deep in Arabic, or learned in natural history, or be well up in his business, and at the same time be able to run his mile, or pull his boat, or hold his bat with some one who has the thews and muscles alone and nothing else besides? The age of the admirable Crichton may have in a measure passed away, but still it is one of the most marvellous of mortal creations. It is essentially a distinguishing mark in a man to be good for every thing. What we want then, not the least in the mawkish sense, is to see athletic sports become in men an object of interest to women. Ten thousand admirable trials unknown to-day, even impossible to describe by us, will be then developed. Habits, which have been confirmed in the wrong way, will be broken up. That certain increased morbidity of disposition, the result of mental exhaustion so common in this country, possibly brought on from our commercial application, will in athletic exercises, find its cure. The matter then wants to become, if we must express it more *a la mode*, among all classes of society. We have before this mentioned a boat club where the ladies, the wives, mothers and sisters take a strong interest in the amusements of its members, and to the immense advantage in every way of all concerned. In England, athletic contests are patronized extensively by the fairer sex. Some time ago, we even noticed it mentioned in one of the leading journals, that in the highest walks of life men seemingly were becoming spoiled from the over petting they were receiving from the ladies. Then we ventured to remark that we only wished there might be some of this same attention extended in the United States by our ladies to those of the other sex who were fond of athletic amusements. A good example must undoubtedly bring forth its fruit. The athletic movement would then find in women new friends. If the men had their foot races, their hurdle races, and their cricket matches, and were encouraged by our women, on their side, archery, and a score of other exercises, would naturally be entered upon by them.

To hear the *Diva* in a stuffy loge of the opera throw off her highest *la*, or the tenor skyrocket out his *ut de poitrine* is one thing, but to be in God's fresh open air, on a grassy mead, and to see the victor, all magnificent in his shapely form, built like an Apollo, coming in at the foot race, gives a pleasure which is quite as great and far more natural.

MUSEUM OF NATURAL HISTORY.—On Wednesday June 3rd the corner stone of the American Museum of Natural History was laid at four o'clock, with imposing ceremonies. As the object of the Trustees is truly a national one, the President of the United States laid the corner stone, Robert L. Stuart Esq., President of the Museum, made an opening address, setting forth the objects of the Society, and H. G. Stebbins spoke in behalf of the Department of Public Works. The Governor of the State also made an appropriate speech.

The ground on which the new Museum will stand, was originally intended for a zoological garden, but the property owners having objected to the project, the idea was abandoned, and the land was turned over to the Trus-

tees of the Museum, who will in time to come cover the whole area with suitable buildings. The collections will be bought and cared for by moneys contributed by the Trustees individually and the public, but the building now in progress will be erected at the expense of the City, which has already appropriated \$500,000 for this purpose. The land covers about eighteen acres, and lies between Eighth and Ninth avenues and Seventy-seventh and Eighty-first streets. The building has been so designed that it can be erected in sections, and thus always be practically complete and yet ultimately occupy the whole area. The building, of which there will be only one section now in course of erection, will, when completed according to the plan, be larger than the British Museum. The object of the museum is two-fold: First, to interest and instruct the masses; and secondly, and especially, to render all the assistance possible to specialists.

The library presented to the Museum by Miss Wolfe will be placed in the upper portion of the building. This library, with a large collection of shells, also donated by Miss Wolfe to the Museum in memory of her father, who was its first President, was purchased by her at a cost of \$35,000. The other collections at present in the temporary Museum are valued at \$250,000. A rare and newly complete series of American birds, and many fine birds of Paradise and pheasants, now in the collection formerly belonging to Mr. D. G. Elliott, will be added. The Trustees have purchased the collection of Prince Maximilian, of Neuwied, on the Rhine, above Bonn, and a large number of specimens belonging to the late Edward Verreaux, of Paris. Large donations of shells, corals and minerals have been received, as also a collection of 20,000 insects.

The building when completed will be a credit to the nation, not only for its exterior appearance, but for the valuable collections which it will contain. The library and collection will attract many students of natural history, while the exposition rooms will be thronged by thousands of visitors. The inauguration of this princely temple of science, is the first grand step made in New York towards the advancement of the study of Natural History.

THE INTRODUCTION OF SINGING BIRDS INTO THE COUNTRY.

—The Cincinnati Society of Acclimation still continues its good work. In the winter of 1872-73 it received a large shipment of birds from Europe, and set them at liberty in the spring of last year. Of these birds, the Secretary, Armin Tenner Esq., informs us, several species built their nests last summer in the neighborhood of Cincinnati, some staid all the winter, and within the last four weeks even such as left their breeding places last fall have returned. The present year will show whether these European birds can be introduced into the good State of Ohio. The birds set at liberty consisted of red breasted robins, wagtails, sky larks, starlings, dunlocks, singing thrushes, black birds, red wings and nightingales. Quite lately the agent having arrived from Europe, the following additions were made:—Goldfinches, siskins, great tits, Dutch tits, dippers, Hungarian thrushes, bullfinches, cherry birds, nestle thrushes, corn crakes, crossbills, &c. Some \$8,000 has so far been expended by the society. The main object of the association is to foster the introduction of foreign useful insect eating and singing birds, and to urge proper legislation for their preservation.

There is something exceedingly beautiful in the idea of citizens of foreign birth being desirous of surrounding themselves with the most pleasant associations of their mother country, and as the conception is a German one, it redounds to their credit. If it was considered among the old Romans and Greeks, as pleasing to the gods to give liberty to caged birds, there still remains in the present race of men, some thousands of years older, this same kindly touch of nature. It would be pleasant for us to record that similar associations were being organized in other States. The President of the association, A. Erkinbrecher Esq., with the Secretary, A. Tenner Esq., state their willingness to give all information to those proposing to introduce foreign birds into the United States.

THE COMING CONVENTION AT OSWEGO.—The Hon. A. C. Mattoon, the President of the New York State Association for the preservation of game and fish, writes us the following:—"We are having some little delay in procuring pigeons, but are confident of final success; two of our members are now with Mr. Henry Knapp in Michigan securing birds for us. I think the 15th of June will be the day of the meeting of our convention."

In this connection it may be not improper to mention that the Publishers of FOREST AND STREAM will present to the Association a Silver Vase with an appropriate design beautifully executed by the Gorham Manufacturing Company, to be shot for by the Association under its rules, as follows:—

The shooter to stand with his back to the traps, and at the word "Pull," wheel and fire, from five traps, five yards apart, 21 yards rise, 80 boundary. Number of birds to be left to the Committee on Pigeons. This prize will be shot for only once, and become the absolute property of the gentleman winning it.

An elaborately finished engraving of the Silver Vase will appear in our journal, at the time the presentation prize is shot for and won.

SENDING MONEY TO US.—As on several occasions of late, money sent to us by letter has not come to hand, we would advise all our friends to use either checks made payable to our order, or what is better, post office money orders.

THE MICHIGAN GRAYLING—(*Thymallus Tricolor*).

WE present to our readers with no little pride the first engraving of the American grayling ever produced in the United States. As there had been a great deal of interest manifested in this fish, we wrote some time ago to Professor Baird, of the Smithsonian Institution, who very kindly sent us a photograph. The picture was not a perfect one, however, and Professor Baird informed us that it was taken from rather a poor specimen. It is to our most able correspondent and indefatigable pisciculturist, Fred. Mather, Esq., that we are mainly indebted for the picture of the THYMALLUS TRICOLOR. Addressing Mr. Mather on this subject he very kindly sent us on ice a fine specimen of the grayling from his fish ponds at Honeoye Falls, and Mr. Forbes, the artist, being in attendance on its arrival, the fish was taken from life, and drawn with exceeding accuracy on the block. The exact size of the fish was ten inches. We cannot describe the grayling better than by taking Professor James W. Milner's and Mr. F. Mather's accounts of the fish from former numbers of FOREST AND STREAM. Professor Milner thus writes of the grayling:—

"In shape the fish is like a trout, a trifle slimmer, perhaps, and not so thick near the tail, but the fin on the back of a trout looks so small and square, so deficient in outline and color, after beholding the graceful curve of a grayling's dorsal. The scale is large, silvery, with sometimes a copper tinge; near the shoulders there are black spots, sometimes triangular, and at others V shaped; in some fish these extend nearly to the tail near the back; they are in lines which gradually shorten towards the belly; the mouth is small (nearly square when opened), and the teeth are merely a slight roughness on the lips, none on the tongue. But you want to see him come in on a line, with his fins all standing, and your eye will then give you a better idea than all the cold-blooded descriptions could ever do."

In another article (May 22) Mr. Mather says:—
"I wish to add a little to the description given in my former article, as a little longer acquaintance has developed new beauties. The eye of the grayling is large and full, with a beautiful yellow iris, and when I wrote 'the tail is forked and plain,' I had not observed its pinkish edge, nor the changeable, metallic green lustre that it shows in some lights, which is more like that seen in silk. A glint of the same is also observable on the second dorsal. Many letters have asked the question:—'Is this fish as handsome as the trout?' And in answer I will say yes, to some eyes, while to others it may not be. Seen from above it does not appear so, as the pink and white of the trout fins are more showy. The form of the grayling is more graceful than

"There is no species sought for by anglers that surpasses the grayling in beauty. They are more elegantly formed than the trout, and their great dorsal fin is a superb mark of beauty. When the well-lids were lifted, and the sun-rays admitted, lighting up the delicate olive-brown tints of the back and sides, the blueish white of the abdomen, and the mingling of tints of rose, pale blue, and purplish pink on the fins, it displayed a combination of living colors that is equalled by no fish outside of the tropics."

What follows is from Mr. Mather's admirable article in our number of April 23d, which has attracted so much attention:—

"The grayling has all the fins of a trout; his pectorals are olive-brown, with a blueish cast at the end (I am describing him in the water as I saw him in my ponds an hour ago), the ventrals are large and beautifully striped with alternate streaks of brown and pink, the anal is plain brown, the caudal is very forked and plain, while the crowning glory is its immense dorsal; this fin rises forward of the middle of its back, and in a fish a foot long it will be nearly three inches in length by two high, having a graceful curved outline, and from eighteen to twenty rays dotted with large red or bluish purple spots, which in life are brilliant, and are surrounded with a splendid emerald green, which fades after death; it does not seem as if this green could be represented by the painters' art; it is that changeable shade seen in the tail of the peacock."

the trout's, and the head is beautiful, while the side of the trout and its lower fins are more gorgeous than those of the grayling. The trout has not a handsome head to my eye; the lines are hard, and there is an expression of savageness in the jaws."

We call particular attention to the marks on the fish. They will be found to be arranged in a certain positive order, running in accurate diagonals from left to right. What Mr. Mather calls "the crowning glory of the grayling" is its immense dorsal, which streams out like a pennon on a lance. The curious adipose fin which marks it as one of the salmonidae is clearly shown. We trust soon to be able to give the distinguishing traits between our native fish and the English grayling.

We suppose that there are innumerable people in this world who will urge that the world is flat. We do know some that are sceptical as to fish, who deny the existence of the grayling, and from never having seen the fish dead or alive, are ready to declare that the Thymallus of our waters, has no spots at all, no dorsal fin, and that it is a mythical creature, the offspring of some diseased pisciculturist's brain. Of course we are unwilling to enter into a controversey with such people. The picture we present must settle all disputes. It is truthful in every detail.

Sporting News from Abroad.

DUCK SHOOTING ON ENGLISH WATERS.

[From our Special Correspondent.]

POSSIBLY of all English shooting I like wild fowl shooting the best in its varied phases and exciting vicissitudes. I used to live near a quantity of "back water" which gave place at times to the blackest and slimiest acreage of mud, and which was esteemed a charming habitat by the birds of the sea. It was called "the swale." This turbid tributary and its waters were of a rich brown color, only equalled by Dunn's soluble or rather insoluble chocolate. It formed a sort of creek, and by that means a harbor, but there was not much traffic on it, and save a few fishing smacks and coal barges, the ducks had it very much to themselves. At low water it was a woful sight, for there were miles of mud and banks, whose perfumes, when wafted to the nostrils, smelt of anything but thyme and violets. Here and there stuck up in the sand the mighty ribs of some worn out old collier looking like the skeleton of a deceased Mammoth, and the shoals of sea gulls which settled on the cockle beds and circled round in the air above our heads, used to deafen us with their screams. I always despised such small deer and let them live, as they do no harm, but rather good, though they often considerably "riled" me by putting up the black geese and ducks before I got near them. Like vultures these gulls scent their prey from a distance, and if fishermen throw away the refuse of their nets the air immediately swarms with them, though there was not one in sight a moment before. I procured a low flat boat, painted her white, rigged her with a lug sail, and when the hard weather came I set to work like a professional fowler. From my boat drawing but little water, I could get well up on the shallows, and as she was scarcely visible and looked almost like another duck, I frequently got quite close to my birds before they knew what was up. I started at first unaccompanied, save by my retriever, but I soon found that didn't do, as from my own experience, I often found myself left suddenly by the tide on some rising

ground with the pleasant prospect of having to remain their till it came in again. Therefore, taught by experience, which I have always found the very best tutor, I enlisted the services of an experienced boatman, and I was soon able to give a good account of my day's sport.

It was really very exciting, that blissful time when we had discerned in the grey cold morning a long dark line of black geese and widgeon feeding in happy ignorance of the machinations of their foes. I have often caught myself trembling with emotion as we gradually floated towards them, lying flat in our tiny scallop, I myself gripping my breech-loader and my man steering and holding the muzzle of his long single-barrel in dangerous proximity to my head, our fingers numbed and our teeth chattering, but an eager expectation preventing our feeling the cold. Sometimes at about seventy yards distance the boat would suddenly stop short, having stuck on the mud, and we had to let her swing round and drift off or give the birds a long shot, jump up and push her off. Sometimes the wary geese would huddle together, lift up their heads and slope quietly off in a long black line, which provokingly settled again about half a mile in front of us. If we did get near enough to give them a broadside we let them have it double shot. My boatman, who saw nothing ignoble in "potting" his game, used to let drive at them on the mud with his long shoulder punt-gun whilst I followed suit with my snap-action Powell as soon as they were fairly on the wing, and then gave them left with a wire cartridge, which burst at fifty yards and spread destruction through their ranks. A wave of my hand was sufficient to my wavy-coated retriever and he was splashing amongst the wounded, diving after the most refractory widgeon and bringing him tenderly to the boat's side. Often we would meet with shoals of ox birds and olives which whirled around showing the silvery lining of their wings in their hawk-like flight, and on one occasion I mistook the black fin of a porpoise or sea-pig for the head of a diver, and it was not until I had expended a considerable number of cartridges that I discovered the fishy quality of my quarry.

I have often gone out at night and anchored, waiting for the sound of rustling wings as the flight of ducks swept up the creek, but I found it very difficult to find the slain in the uncertain light, and though a sporting tailor had established himself in a stationery tub with great success, chiefly owing to the alacrity of his dog and his knowledge of the habits of "the goose," yet I did not imitate him and preferred going out on the garish light of day.

A far different style of duck shooting I have enjoyed in one of the Southern counties. Imagine a wide and desolate heath stretching as far as the eye can reach, of a grayish neutral tint, relieved here and there by patches of yellow gorse and purple heather, whilst in one part there runs a long, undulating pine wood forest. Imbedded in the woodland is one of the most beautiful little lakes which I have ever met with. Not a grand expanse of water like a Highland Loch, but forming a picturesque little quiet nook like one of those charming water-color sketches at the Academy "*pinxit Frederick Taylor*." It is full of bull-rushes and lilies—too overgrown, in fact, for much rowing, though in the summer time I paddle about on it in an old tub, a sort of "dug-out canoe," and alternately fish, smoke and read, anchored in a bed of blue forget-me-nots or yellow water flowers. It has a gravelly bottom where the stream runs through it, and in some places I regret to say there is mud. Hemmed in as it is by bushes, rhododendrons and larches, it is secure from the noise and bustle of the busy haunts of men, and it is appreciated by wild fowl accordingly. Numbers of "flappers" are bred there every year, and it perfectly swarms with coots and moorheas, and I have seen the "slot" of an otter amongst the tracks of the water rats. On a summer evening it has for me charms which I seek for in vain at Geneva, Lucerne, or Venice. You may see the big trout rushing at the flies, the bigger carp muzzling like swine amongst the lily roots, the kingfishers swimming swiftly across like flashes of blue light, the sparrow hawks swooping at their prey, the herons angling for dace, and the bats chasing the moths. It is indeed a perfect sanctuary of nature. I am not much of a poet, but I believe only Byron could do it ample justice. We have only had one poet in our neighborhood lately, and he was a farmer's son. He came home from school one fine day and chalked on his father's barn door—

"Have no more fear, ye mice and rats,
For 'Cub' and I have killed the cats."

Some one told his father that a poet he'd heard of up in London named Tennyson was making five guineas a line for such writing, and the old man actually consulted the Squire as to the advisability of making his son and heir "a sort of 'prentice, like, to this here Mr. Tennyson." But joking apart, the lake I have been trying to describe is very pretty, and an excellent harbor for ducks.

In the summer they have a pretty easy time of it, but when the winter begins, and the pond is frozen over with the exception of the upper part, where a warm spring prevents it from congealing, their close time is up and they have to look out for the enemy. At intervals along the bank are placed screens and semi-hovels made of turf, gorse, and peat. In each of these recesses is placed a gun, so that with the exercise of tact, keeping strict silence, and having due regard for the wind, we have often surrounded the unsuspecting wild fowl whilst they were quietly feeding. After the first volley from the breech-loaders, the mallards usually make themselves scarce, but the teal come arching round whisking plaintively and courting destruction, falling to the sharp reports which ring out on the frosty air, with dull thuds on the ice, from whence it is often difficult and even dangerous for a dog to get them, when the surface doesn't "bear" properly. I have frequently seen at this little lake, which is about a mile and a-half in length and irregular in shape, quite a duck battue, and as we generally knocked down a few herons and sea pheasants, as they call them, with the addition of a coot or two, our bag at the end of the day was a very large and varied one. You must have a good retriever for wild fowl. Nothing on earth is a greater nuisance than a brute who brings a duck half the distance and then quietly drops it, swims ashore, and photographs himself upon your boots and gaiters. Worse than useless, too, is the dog that is always jumping in behind your back with enough noise to alarm everything living within a hundred yards. Your retriever must be tender-mouthed and fond of water, and be able to withstand the cold. It must have a good coat and a good constitution. If he obeys the slightest sign and never disobeys; if he is quick and intelligent, and can use his nose, I care not much what color or breed he is, but at the same time I like a black and wavy coated one, and don't choose my black servant like the sultanas do, for ugliness. I have had them as sensible as Christians and as sharp after winged game as a money lender—on the scent of sixty per "cent." I have had them very obstinate, very resolute, and very teachable; but if their natural gifts are good and they are not deficient in "nous," I am seldom unable to break them. If trusted solely to my own powers of observation, many a fat snipe and many a luscious woodcock would linger with the agony of broken wing till he became an easy prey to a passing fox, or weasel, instead of gracing my breakfast table. There are two things required to break a dog—Patience and Firmness. Without these qualities, Van Amburgh would soon have had his head bitten off by the lions, and without them no dog is ever made a companion fit for a sportsman.

LDSTONE JUNIOR.

Faversham, England, May 20, 1874.

—Quail are abundant at the east end of Long Island this spring.

ZOOLOGY OF THE NORTHWEST.—Our leading article in the present issue of *FOREST AND STREAM* on the Cervidae of our Northwestern Territories, is valuable, not only in its exceeding interest to the sportsman, but as a new contribution to science. The writer introduces us to a new Arcadia with its wonderful scenery and conformation, its remarkable variety and abundance of animal life, of elk which no dog-however fleet can catch, of deer that clear the umbrage of a fallen tree at a bound, of herds that number hundreds, some of them that have never heard the crack of a rifle, like those in Eden, which were tame because they knew Adam had no gun! Here no less than five varieties of the Cervidae are found, and of these one seems unknown to naturalists, and existing nowhere else. It is an Albino and in its person and presence sets at rest all puzzling questions that bear on hybridity. Its origin is authentically traced to a breed of snow-white deer now supported to exist only in inaccessible mountains of Oregon and California. Our author has opened up to our astonished view a new Paradise which eclipses the Happy Hunting Grounds of the aboriginal Indian and should make him loth to exchange his real Arcadia even for his ideal Heaven.

AN ACKNOWLEDGEMENT.—With becoming modesty, we trust, we print the following testimonial contained in an extract from a business letter just received from the celebrated English gun firm, whose signature is appended:—

PIONEER WORKS, ST. MARY'S SQUARE,
BIRMINGHAM, ENGLAND, May 13, 1874.

* * We must say that, after a perusal [for several weeks] of your paper *THE FOREST AND STREAM*, we come to the conclusion that no other paper with which we were acquainted published in the United States came so near our own *Field*. We will let our partner in New York know who the English correspondent of the paper is, and that will be an additional inducement to avail himself of its columns.

Yours truly, J. W. TOLLEY.

Shot Gun and Rifle.

JUNE IS A CLOSE MONTH FOR GAME.

Details of pigeon shooting and scores of rifle matches, and other interesting matter, should be mailed so as to reach this office on Tuesday morning in each week.

CREEDMOOR.—The first regular match for the Long Range Badge of the Amateur Rifle Club was held on Saturday last, May 30th, at the range. It was open only to members of the Amateur Rifle Club, the distances being 800, 900, and 1,000 yards, five shots at each range. All the club to shoot at 800 and 900, and the eight highest at these two ranges to compete at 1,000 yards. Position any, without artificial rest, with two sighting shots.

As the matches of the amateurs are events of exceeding interest, the marksmen being the *elite* of our riflemen, the assemblage of shooters and spectators at Creedmoor on Saturday last was by far the largest of the season. The day was remarkably beautiful; in fact, the first real summer weather of the season. There was not a single cloud in the sky, and the sun, about three o'clock, when the match was on, blazed with unusual warmth. Bright days are not, however, always conducive of fine shooting. Although there was no exact quiver in the atmosphere, there was a superabundance of glare, which very probably gave some slight effects of mirage to the targets, which may account somewhat for the shooting not being of the most remarkable character. The wind was fairly steady, blowing gently on the targets, a V wind about, sometimes VI, increasing slightly at the close of the afternoon. It should be borne in mind that this match was the first serious attempt to master the difficulties of shooting at long ranges, the Amateur Rifle Club having shown by their last match at 500 yards, where Messrs. Bodine and Conlin so distinguished themselves—each having made seven consecutive bullseyes—that they were fairly masters of the situation. When the 300, 400, and 500 yards were added to the distances the difficulties were naturally found to be very much increased. Just such fine considerations as the fraction of a minute in an elevation, or the exact proper allowance for the windage, the few grains too much or too little in the charge, or a ball loose in the cartridge, or too much paper or too much grease on the ball, or a dirty rifle, all were discovered to exert certain disturbances, which, if slight in their effects at 500 yards, were much more than doubled at the additional distances the men were firing at. We must then look at the next half dozen matches, at least, of the Amateur Rifle Club as schools of practice, and we feel sure that by the middle of July, perhaps sooner, the care and study already evinced by the members of the club, will be rewarded by increasing scores. Of course there is a good deal of serious, hard work to be gone through before our American riflemen can compete with the Irish team. We therefore are only too glad to mention our approval of this determination on the part of the officers and gentlemen of the Amateur Rifle Club to do their best in studying up the niceties of long range shooting. We noticed very particularly how thoroughly the club makes use of the new score book, published by Messrs. Moore's Son, and how every shot was marked on their targets and due note taken of elevations at various ranges, and how facts and theories were studied. The hap hazard methods of shooting must naturally be eliminated in time, and the exact idiosyncrasy of each weapon, with the corrections for the peculiar disturbances arising from the light, the differences of atmospheric pressure, and the effects of wind, will all undoubtedly be determined. It is quite a task, in fact, to bring down the

rifle to its work, the man being put out of the question. In fact this is half the battle. The arm once properly studied—how to hold the weapon and how to shoot it, is but the other half of the battle. There were eighteen entries. The rifles used were twelve Sharps and six Remingtons. The scores were as follows:—

Name	800 yds	Total	900 yds	Total	1000 yds	Grand Total
L. L. Hepburn*	0 2 4 4 4	14	3 4 3 4 3	17	31	45

*Remington sporting. †Sharpe sporting.
Elevations used were about—for 800 yards, 1.54; 900 yards, 2.11; 1,000 yards, 2.29.

To Mr. L. L. Hepburn was awarded the prize, the score forty-six made by him, in a possible sixty, being a fair one. Captain Bodine, it may be noticed, in the 800 yard match has a zero in his score. It is highly probable that Mr. Bodine, in this shot, was on the target, but by some mistake of the marker the points were not scored to him. The executive committee being called together on the ground, accorded Captain Bodine the privilege of another shot; with great gallantry it was refused by the marksman. Had he exercised the rights allowed him he would have very probably either tied or beaten the score of forty-six. Perhaps it would be wiser in all these cases of shooting at long range to have more than one telescope constantly directed on the targets, for even the Amateur Rifle Club may scratch sometimes with a ricochet on the butts. The match was in every way a pleasant one, and in the presentation of the semblance of the medal to Mr. Hepburn (for in fact the prize had not yet left the jeweler's hands) Col. Gildersleeve, the Secretary of the National Rifle Association, made an appropriate speech. In comparing this match with the sharpshooter's championship last year, where Messrs. Roux, Fulton, and Yale were competitors, we find that these gentlemen, at 800 and 1,000 yards, shot pretty much the same average as on this occasion. Excepting with the two leading marksmen, almost all hands seem to slip up on the 1,000 yards.

On the grounds on Saturday last considerable good practice was made by members of the Seventh Regiment. We saw the bullseye hit so many times hand running at the 500 yards range with the Remington military, that we are afraid to mention the number. Although practice scores cannot be published by us, we must on this occasion make an exception. A gentleman on the ground tried for the first time one of the new model army Springfield rifles, and the results of his shooting were very extraordinary. Taking the gun, sighted as it was from the armory, and shooting off hand, without a rest, at 500 yards he made the following score:—2 4 4 4 3—17. The gun is undoubtedly a most admirable arm. Something, however, must be said for the marksman, who, to use the emphatic language of the period, is no "slouch." The famous brass shell badge of the Seventh Regiment, now adorned with a very handsome massive gold clasp, was won last week by Corporal Price. The following are the best scores. Distance, 500 yards; arm, Remington military rifle:—

Name	Score
Corporal Price	3 4 4 3 4—18
Corporal Baughie	4 3 4 3 4—18
Private Coughtry	4 4 4 2 3—17
Corporal Gardner	4 4 0 3 4—15
Corporal McMillan	0 4 4 2 3—13

On Saturday, June 6th, will take place the opening match of the National Rifle Association for 1874. There will be five matches, as follows:—1st. Director's match; 200 yards; military rifle; prize, gold badge. Second match—*Turf, Field, and Farm* badge; 200 yards; any breech loader. Third match—Military match; 200 yards; any military rifle; gold badge, etc. Fourth match—Open only to members National Rifle Association; 500 yards; prizes, gold badge, etc. Fifth match—Remington Diamond Badge; 500, 800, and 1,000 yards; any rifle. [For full particulars see *FOREST AND STREAM* of May 7th].

—At last matters in regard to the English National Rifle Association have been arranged, and Mr. Ross, the greatest opponent of the innovations as to material of target and form, though having, as is stated in the last number of the *Volunteer Service Gazette*, "very temperately and frankly given expression to his dislike for the substitution of penetrable for impenetrable targets," has become reconciled to the system of patching the targets. The new divisions of the target, Mr. Ross admitted, were questions of lesser importance, only he made the suggestion "that the bullseyes for the 500 and 600 yard ranges should be slightly increased so as to ensure their being within the ascertained power of the Snider." We have taken especial note of these changes in Wimbledon, believing that all the *pros* and *cons* stated by us, taken from English sources will be of interest to us at some future time. "Coaching" is to be prohibited on the English ranges, but we suppose, with the new system, (as the dummy target very probably will not be used,) that telescopes must be brought to bear on the targets. "The use of telescopes by the competitors," says our English authority, "or rather by their friends is, we learn, to be permitted this year. Lord Ducie stating that that the 'patch' system involved this indulgence." At Creedmoor we heard last year some quite decided grumbling as to

"coaching." As far as the giving of advice goes, we are very much in doubt if the most minute directions poured into a shooter's ear ever did him the least bit of good. A certain kind of physical coaching may, however, give some aid, which is hardly fair, such, for instance, as cleaning the rifle or loading for the shooter. All coaching is, of course, a nuisance, and we fancy, if carried out to an extreme this season at Creedmoor, the range committee will make some very good rules in regard to it.

—Sometimes in looking over a well-kept score-book, just such a one as that published by Messrs. Moore's Son for the use of the riflemen at Creedmoor, the uninitiated may see "Wind 2;" or you may hear one marksman coaching another as follows: "Watch out now. When you lead off this morning the wind was 9; it is now working round, and it is dead 12 this very minute." It must be confessed that as the positive time of the day may be 2 or 3 o'clock by your own chronometer, the explanations of these terms of the time of day are at least eccentric. The rationale of it is, however, quite easy. Points of the compass have and have not to do with it. If you can't steer a ship by a watch, at least it is an easy help for riflemen to know which way the wind blows, so that he move his sights to the right or left, and may make a quick note of it in his book. For instance, as the butts or targets never move, the watch is taken out and the numeral 12 on the dial is put in line with the target. Now suppose the wind was to blow directly on the rifleman's back. Twelve o'clock being the imaginary north, the wind would be at 6 o'clock an imaginary south. If it came from the right exactly, an imaginary east or 3 o'clock, would be noted; if due west 9 o'clock would be written down. All the variations of the winds, as seen by their effects on the streamers, can be noted this way. In fact it is the rifleman's method of boxing the compass, and as most every one has a watch about him, and not a compass, and as besides N. by N. W., or S. by S. S. W., is not as generally well understood as the figures on a watch dial, this method of calling the wind by the hours of the day, as expressed on a watch dial, is quite a simplification of matters.

PAPER AND METAL SHELLS.—We have received a great many letters complaining of the difference in size of metal and paper shells. For all kinds of shooting which does not require loaded shells to be carried about the person of the field sportsman, such as wild fowl, beach snipe and rail shooting, metal shells are more desirable to use generally than paper ones. They are more economical, and when loaded the powder is liable to receive less injury from dampness. In the present construction of metal shells the main principle and feature in adapting them to the use of breech-loaders seems to have been overlooked, and that is, to have them the same size inside and outside, with paper shells of the corresponding number. As they are now manufactured the metal shells are about two sizes larger than the paper ones, and as nearly all breech-loaders are constructed to use paper shells, they are not adapted to use metal ones. They are so much larger in the bore where the shot are chambered that the pellets are crowded and become misformed in their passage into the barrel which is still less than the bore of the paper shells. We think it quite possible that the metal shells could be made so that both kinds of cartridges could be used in same bore guns, and beg to call the attention of manufacturers of metal shells to the desirability of both kinds of shells corresponding in size.

THE DOMINION TEAM FOR WIMBLEDON.—At a meeting of the Council of the Dominion Rifle Association, held on the 27th of May, the following team was appointed to go to Wimbledon:—Captain Arnold, New Brunswick; Color Sergt. Ballie, Ontario; Private Brosseau, Quebec; Captain Church, Nova Scotia; Private Disher, Ontario; Major J. M. Gibson, Ontario; Captain Hickey, Nova Scotia; Lieut. MacNacht, Ontario; Captain J. C. MacPherson; Ontario; Captain J. J. Mason, Ontario; Private T. Mitchell, Ontario; Color Sergt. Omand, Ontario; Corp. Pain, Ontario; Corp. Pallen, New Brunswick; Captain Thomas, Quebec; Sergt. Sutherland, Ontario; Lieut. Whitman, Quebec; Battery Sergt. Major Winne, Montreal, Quebec; Ensign Wolfenden, British Columbia.

—The Connecticut riflemen who have formed themselves into the American Rifle Association will hold their annual shooting festival on the 26th, 27th and 28th of August next at Meriden. Preparation is being made among the New England regiments for shooting at Creedmoor.

—E. H. Madison, of Brooklyn, has invented a new process for the "browning of gun barrels." We have seen several specimens of the beautiful manner in which this expert has executed this delicate work and have no hesitation in recommending this process to all gun manufactories.

—The Kankakee Sporting Club, of Kankakee City, Ill., have elected the following officers:—President, J. L. Shields; Vice President, S. McKelvey; Secretary, C. A. Carpenter.

EDITOR FOREST AND STREAM:—

The members of the Sea View Park Association of New Dorp, Staten Island, held a very interesting pigeon shoot on May 30th. There were two matches, both at single birds. As will be seen by the scores, the shooting was very poor:—

FIRST MATCH.	SECOND MATCH.
Merauke.....0 1 1 1 0 0 0 1—5	Rodjier.....0 0 0 1 1 0 1 0—3
Henry.....0 0 0 0 0 0 1 1—3	Lindeman.....0 1 0 0 0 1 1 1—5

Rodjier did not shoot the tenth bird, as he could not tie Lindeman. In the third match Ficken won, and the fourth resulted in a tie, which was eventually won by Lindeman. Gus Woodcock

A CURIOUS SHOT.

EDITOR FOREST AND STREAM:—

A remarkable shot was made two years ago by Prince Carolatti, who owns extensive domains with large forests in Silesia, Prussia. Taking a drive of inspection through the woods in company with his chief game-keeper, with the intention of having a shot if occasion offered, a drove of seven deer feeding near the road were seen. When the wagon came near them the drove separated, four of them running to the left and three of them, a buck, a doe, and a fawn, turning to the right. The wagon having stopped, the three deer halted in their flight and turned their heads, eyeing the vehicle, the buck standing apart from the rest. The Prince fired at the buck, aiming at its right shoulder, but what was his surprise when he saw the three deer drop, killed on the spot by the one shot. The game-keeper took at once a measurement and found that the buck was standing sixty paces from the wagon, the doe six paces to the left of the buck, and the fawn four paces to the left of its mother, as represented in this diagram:

*The wagon, 1 the buck, 2 the doe, and 3 the kid.

The range was perfectly clear of any object, by striking which the bullet might have been possibly diverted. An examination of the buck showed that the bullet had taken a twist in his body, striking the right shoulder in a slanting direction. Instead of passing out in a straight line on his left side, it had glanced off from the shoulder blade, and in its new course by a strange accident had struck the doe with deadly effect three inches below the shoulder, and passing through her body also had hit the kid in the eye and killed it. The force of the bullet, meanwhile, was spent, so that it lodged in the head of the kid, where it was found afterwards.

This extraordinary result of the shot cannot be accounted for but by the course of the bullet being laterally and vertically changed when it passed through the bodies of the buck and doe in succession. The Prince said, that having handled a rifle since more than fifty years, he would not have hesitated at firing at the buck if persons had been standing in the places where the doe and fawn were killed, because he should never have dreamed of a possibility of the bullet taking so strange a course as it did in this instance.

LEHMAN.

DETROIT, May 30, 1874.

EDITOR FOREST AND STREAM:—

Enclosed I take pleasure in handing you score of the last State Medal shoot, which took place May 29, using wild birds. After the medal we shot a Sweepstake of five birds, each shooter depositing \$5, and having a drawback of \$1 for each bird killed, each man putting \$1 for each bird missed into a purse, and the longest liver wins. As will be seen by the score, our worthy and much respected president captured it. The day was pleasant, although somewhat warm, we were favored with a very refreshing breeze from Lake St. Clair, and the day's sport was very enjoyable. We shall probably shoot again next week. Wishing for the entire success of your esteemed paper, which is fast gaining friends in these parts, I remain yours,

J. E. LONG.

—Crematory age—"O, ma! ma! Johnny's got the urn and is spilling pa's ashes over the floor!" "O, what a naughty Johnny! Get the feather duster and sweep your poor father right up!"

—We notice with pleasure that the Senate has passed a bill, on motion of Mr. Ferry of Michigan, giving shape to the proposition made by the Senator, to have a portion of the Island of Mackinaw preserved as a public park. Some months ago we argued on the necessity of this measure, and hope it will become a law before long.

Sea and River Fishing.

FISH IN SEASON IN JUNE.

Salmon, *Salmo Salar*.
Trout, *Salmo fontinalis*.
Land-locked Salmon, *Salmo gloveri*.
Black Bass, *Micropterus salmoides*.
Striped Bass, *Roccus lineatus*.
Bluefish, *temnodon saltator*.
Salmon trout, *Salmo confinis*.
Shad, *Alosa*.
Michigan Grayling, *Thymallus tricolor*.
Micropterus nigricans.
Sea trout, *Salmo immaculatus*.
Weakfish.

From the kinds of fish displayed in our markets from week to week, anglers who know the habits of the fish, can estimate their chances for sport along shore. From the locality where the fish are found to-day they determine where they will appear next day or week, subject always to contingences of weather and the movements of the fish food upon which they prey. The latter is a valuable and almost infallible sign. Those who cannot tell for themselves, we shall attempt to instruct. Now, this month of June marks the advent of the summer schools, and probably during no other month will the naturalist or epicure find such a variety of fish in market. Indeed, there is not only variety, but an endless profusion! In the first place let us speak of that *rara avis* (?) among fish, the delicate, luscious, superlative Pompino. We use the singular number in this case and do not print Pompinoes. Only one was caught off the capes of the Chesapeake last week, and was sold in market for \$3. What did it weigh? Why only three-quarters of a pound. Perhaps not 100 pounds of these fish are caught in the whole year north of Hatteras. Spanish mackerel have also put in an appearance, and the catch has been fair off Norfolk. They find eager buyers at sixty cents a pound. In about ten days they will come to the Jersey coast and fishermen are now on the *qui vive* for them. The fish now on the stands weigh about 1½ pounds; later they will turn the scale at 4 to 5 pounds, and be better in quality. One rare fish which we saw at Mr. Blackford's stand, the fisherman call the three-tailed Porgee. It was a big, broad, flat fish weighing some four pounds with an infinitesimal mouth and a monstrous dorsal fin. Consulting DeKay we found it to be the moon fish, (*ephippus gigas*), quite rare on our coast, the mouth of the Hudson being its extreme limit. To satisfy one's ichthyological predilections is one thing, but to delight one's gastronomic tastes is equally pleasant, and having eaten this moon fish or a part of him, we must declare *ephippus gigas* to be the most delicate of fish, and make bold to ask for more. Mr. Blackford states that about a dozen moon fish come to market in a season. Occasional gar fish are also seen. They are usually small in these waters; we think we have seen them much larger in southern waters. Our Hebrew friends being denied the luxury of eating eels, because eels have no scales, take gar fish in their stead. Gentiles will not eat gar fish, because the bones are green. Our Jewish friends laugh at the credulity of their Christian neighbors, and keep alive the superstition that green bones in fish are poisonous, and so have the gar fish market to themselves. No people know how to cook fish like the Jews. If you do not believe us read the German poet Heine. Salmon still rare and dear, and green peas coming in season. Too bad! Salmon bring seventy-five cents a pound, and are coming slowly from the Provinces. No matter. The break down is not far distant. The influx will come before long and then prices will tumble. But then, alas! peas will be no longer tender! Cod are leaving our waters and moving up to draw upon their banks and get fat and solid and plethoric. Halibut good and plenty, and porgies are in number. Shad are in plenty too, from the Connecticut River, and esteemed the finest of all shad.

Thank Goodness! now is the time for the poor. Pisciculture means food for the small purses more than for the big ones.

Blue fish are now plentiful at twelve cents a pound and likely to be six or five cents before a month passes. Soft crabs have never been so plenty, coming from Norfolk and selling at fifty per cent less than they brought last year. There is a crying shame about this soft crab business. The Jersey people are sending them in to market no bigger than a half dollar. This is waste and some day there will be a crab famine. We still see baby lobsters in the market. We trust they are not from the Bay State. Rumor says they come from Maine. Some day there will be no lobsters there at all. Why does not the Maine legislature make laws in regard to the lobster catch like those enforced in Massachusetts? By the way, the Martha's vineyard lobsters are coming in, gigantic crustaceans, some of them weighing ten pounds. A whole smack load of lobsters coming into New York yesterday averaged four pounds each. Striped bass scarce, and shedder crabs to catch them with worth their weight in gold. Mackerel in quantity and sheephead, and the first weak fish, and the tautogs.

We could fill the whole paper with the various fine fishes the sea is furnishing us with now, but what we have already said should suffice. We add a hint or two as to localities for fishing. Blue fish are at Barnegat, and at Port Washington last Saturday we saw fine large ones.

—Noyac Bay, about four miles from Sag Harbor, has been crowded with menhaden during the past week, but they have been so followed up by porpoises that the fishermen have been unable to secure any large hauls. On Tuesday, the 26th of May, there were over a million of fish in the bay, and the Payne Company thought they had surrounded an immense shoal safely, but before they could encircle them porpoises drove them out of reach.

—During the hauling of a small seine in front of Mr. Sampson's residence at Noyac on Thursday last, a sturgeon over six feet in length was caught. The boys at the east

end of Long Island have not been so full of fish for years past as now. There is excellent bass fishing on the inlets, off Sag Harbor, with shrimp bait.

—Farmers at Southampton Township, L. I., will have to bear in mind that there is a law now against their throwing moss-bunkers on their lands unless they plough them under within a day after they are deposited.

—The W. W. Coit commenced running three times a week to Orient, Greenport, and Sag Harbor, on May 25th, but was obliged to lay off until the 30th, after her first trip, owing to the clogging of one of her boiler pipes, which had to be renewed.

—Tautog are reported to have put in a lively appearance in the waters of Buzzard's Bay, both in quantity and size. Fishermen have been wonderfully successful in their catchings. Parties put out in early morn and return in two to four hours bountifully rewarded for morning exercise, mingled with rare sport.

—From the New York Sun we have a clever account of the capture of a whale some forty feet long near South Amboy. The huge creature had been stranded. The Sun says:—

There were divers conflicting theories as to the cause of this whale's inland excursion. Many old fishermen, who by virtue of their calling were supposed to know all about whales, though none of them had ever seen one, cherished a pleasant fiction that the creature, being essentially a denizen of the briny ocean, getting accidentally into the river, had become blinded and bewildered with the unwonted effects of the fresh water, and moved on blindly to its fate without knowing where it was going to. Others assigned sickness as the cause of its coming up the river, saying that these creatures always went into shallow water when they felt themselves dying, and this theory was somewhat borne out by the fact that the creature's snout was covered with parasites, which are said to attach to whales when they are on the point of death.

In coming up the river the whale must have kept in a comparatively narrow channel, the water of the Raritan being very shallow for some distance from the banks. Had it been high tide there is a strong probability that it would have passed up to New Brunswick, a distance of seventeen miles.

The whale was found to measure 48½ feet in length, 9 feet through the body, and 30 feet in circumference. The head was 10 feet long and the tail 14 feet. The gills, from which the whalebone is produced, were 9½ feet long by 4½ deep.

The poor creature was shot with a rifle, hacked at with an ax, and at last killed by a harpoon.

—Our anglers who are in the habit of frequenting the Grand Lake Stream in Maine for the landlocked salmon, will be pleased to know that a splendid little steamer called the "Naiad" was built this spring at the Salmon Falls Machine Shop and launched at Princeton on the 13th May. She will probably run regularly through the season, leaving the Stream every morning, connecting with the first train to Calais, and returning in the afternoon on the arrival of the train at Princeton. She is thirty-eight feet long, with an engine of six horse power.

—The subjoined letter contains two or three points of interest to the angler. We regard the experimental tests in fly-casting as of much practical value in determining the relative power of rods of different materials. The decision in favor of the bamboo is unequivocal and positive.

WASHINGTON, May 20, 1874.

EDITOR FOREST AND STREAM:—

My salmon fishing friend C., who has the River St. John in Gaspé, has just left my house, where he has spent a week. He brought on from Boston eleven of his fine rods. We threw measured lines with all, and made most exact record. C. is so particular to keep his name (as a general thing) out of print, that I didn't dare to write it up for you, and I thought I had seen a fly thrown before, but I never had. C. moves his body so little that you would hardly notice it 300 feet off. The line quietly begins to unroll and roll over and over on itself, until it straightens out perfectly about ten feet or so above the water. About ninety feet measured in my yard from his feet to where the end of the line struck. About fifteen feet farther could regularly be thrown with the bamboo than with the best greenheart rod. A stranger came up to me at Little Falls took off his hat, begged pardon and said he merely wanted to pay his respects to my Norris greenheart salmon pole, which he thought the perfection of a wooden rod. C. is again coming on from Boston to my house for a week about June 15, and we shall thoroughly try the shad fly-fishing at Great Falls, the terminus of the Potomac shad route. By the way, small shad repeatedly pass through our water service pipes in W—, and our water is taken from rivers above Great Falls. Query: Do some strong shad at very low water get over Great Falls, which is really a series of steep rapids, or are they accidentally "locked" into a canal where it empties or connects with the Potomac at Georgetown?

A. G. W.

—Perhaps a Georgia *salmo fontinalis*, (speckled trout,) may seem a rare curiosity to our eastern readers who fancy that this fish does not exist in that southern State. Nevertheless, the species does abound in the mountain regions, and is known as the "mountain trout," for Georgia is the empire State of the South and covers many degrees of latitude. Now here is a "specimen brick" from that section, mention of which has been made to us in a private letter from Atlanta:—

"On the 21st day of May, Mr. T. H. McKay caught a mountain trout in Col. R. A. Alston's fish pond, measuring 16 inches, and weighing four pounds."

This will do very well for Georgia. For excellent trout fishing in North Carolina see "Buncombe's" letter in FOREST AND STREAM of May 28th.

THE ADIRONDACKS, May 23, 1874.

EDITOR FOREST AND STREAM:—

The season is backward at least two weeks. I have been here one week and have not seen sunshine yet, but rain incessantly and cold. Martin, on the Lower Saranac Lake has increased his house room enormously and foolishly. The Sportsmen's Home (rightly named) by V. C. Bartlett, on the river between the Upper Saranac and Round Lake, must ever be the centre of attraction in this section. As you approach the house a home feeling greets you. The house is admirably kept and every appointment all that can be desired. Mr. Dearborn is registered here from Boston. Dr. Romeyn of Keeseville; N. Y., Mr. J. McGregor

of Fort Edward, N. Y., Col. J. J. Hoyt of New York, expected to-morrow, and others, who for years have made this their headquarters. Drs. Vosburgh and Tucker of New York, passed through here a few days ago. The rivers and lakes are very high, much more so than I have seen them for years. For the past week much rain has fallen, melting the snow from the surrounding mountain tops. Trouting is good. I have seen already several fine trout deceived by the deceptive fly. Trolling has proved most excellent, despite the rain and cold. A day or two of warm sunshine will give us many trout. Just met Hon. George Dawson of Albany, N. Y., rod in hand, full of hope, goes down the Raquette, and from his long experience, sure of success. A gentleman everywhere, whether at home or abroad, and the trout even appreciate his cordiality. A word more. I am told by reliable guides from Long Lake that Raquette Lake is full of set lines. Why cannot our game laws be enforced? We need a State Commissioner. Local Commissioners cannot do it. Had we a Whitehead and Phelps in this region to enforce the laws, thousands of trout would be saved annually. Boat going to the settlement and I must close. S. S. N.

—In *La Chasse Illustrée* we find an exceedingly interesting article, signed by M. Edmond du Sayé, in regard to the shad in French waters and their method of capture. One peculiarity of the lamprey eel found in the waters of the Garonne in conjunction with the shad is so curious that we translate in full from our exceedingly well informed contemporary. "The shad which ascend the stream of the Garonne are remarkably fine. Those caught in the Garonne are much more appreciated than those captured in the Tarn, the latter stream being of a sluggish character. When the shad get to the junction of the two rivers they are still strong and lusty, and make boldly up the Garonne, while the lamprey eels are in poor condition. The lamprey ascending the river at the same time, has not force enough to stem the current. When it gets to a point where he cannot move against the stream it takes hold of a stone, and waits for a passing shad. When one swims in his neighborhood he takes hold of the shad by the tail. The shad, frightened, redoubles its speed, and clears all the obstacles, and then only the lamprey eel lets go its hold. We had often seen caught in nets, shad, (*coloses*), with lamprey eels attached to them when the nets had been placed in the swift waters." Whether this arises from an accident, or from the desire the lamprey may have to spawn in the sources of the river, the contributor to *La Chasse Illustrée* does not state. To us it is quite a novel feature. Another strange fact recorded by the same authority is that in Russia while shad abound, they are thrown out by the fishermen as good for nothing.

—Our Washington correspondent went black bass fishing the other day and mentions the following facts to attest to the wonderful vitality of the fish:—

"Just as we returned from our day's fishing we took from a pool of water three black bass caught a few hours previous, and after rapping each one smartly over the nose with a stone, strung them and started for Washington. Just one hour and fifty minutes afterwards we reached my house and threw the bass into a tub of water under the hydrant. In an hour after, the biggest bass (2½ lbs.) was swimming about the tub! Can anyone of your readers tell a bigger story, which is absolutely true in all particulars, about the vitality of black bass? Of course we all know that if first frozen, they may be kept a long time and then revive."

NEW YORK, May 29, 1874.

EDITOR FOREST AND STREAM:—

I notice in your last issue an inquiry whether black bass will bite at shrimp. Your conjecture in reply that they will is quite correct. I have used shrimp successfully on the Mohawk River, and in some ponds in Dutchess County where friends of mine are in the habit of fishing. Shrimp take so well that to have a quart of them in good condition (not always easy a hundred miles or so from the salt water,) is considered almost a guaranty of a basket of fish. My own experience shows the black bass to be the most capricious of fish. LITTELL.

FISHING AT THE GREAT FALLS OF THE POTOMAC.

WASHINGTON, May 23, 1874.

EDITOR FOREST AND STREAM:—

If you want to get fish and have sport come to the Great Falls of the Potomac. The fish there don't exactly "sit around on the fence posts" waiting to be interviewed by the piscatorial fraternity, but they will vigorously put themselves in contact with a skillful angler's hook, if he but give them a fair chance, and practice a reasonable amount of judicious discretion by means of his fly.

The Great Falls are located fourteen miles above Washington and seven miles from Rockville, on the Metropolitan branch of the Baltimore and Ohio Railroad. Leaving the Capital, with its miles upon miles of the finest drives in the world, its acres of lovely grass-plots and green carpeted little "reservations," its countless shade trees, resplendent in the fresh verdure of spring, its enchanting parks and flower gardens, you cross Rock Creek to Georgetown, and go thence by canal (fare 50 cents) or by stage (fare 75 cents) to the fishing grounds. If you're both industrious and economical you can "work your passage" in the traditional Erie Canal fashion. (No charge for this advice—we're not subsidized by the canal company).

The Potomac has here three falls, aggregating a descent of 80 feet within the distance of a few rods, with rapids extending for half a mile. The gorge presents a river not unlike one's conception of the Great Canon of the Colorado, only, of course, very much in miniature compared with the monster chasm that confines that giant of the West within its towering walls.

When the season is fairly in the fishing is of the choicest, and the fine frenzy of the sport comes to him who here patiently casts his line, and if he be a true disciple of the great teacher he will surely feel the transporting tingle at the finger tips. Big bass, little bass, rock or striped bass in season, are the game fish abounding at the Falls. One bass caught here this week weighed 4 pounds 14 ounces—a prize. Your correspondent got away with 25 pounds in the course of four hours' fishing, one morning last week, and felt repaid by the enjoyment obtained, though the catch is nothing to speak of, the fish being under sized. The weather and water were unpropitious at that particular time. When the river clears the sport will not lag, not while there are honest fishermen toiling in the Government service here. Never! Treasurer Spinner—he of the lovely countenance and honest heart—will give the last man and the last dollar for a bite.

What of the accommodations there for visitors? Well, good, unexceptionable, we may say. At the "tavern" of Messrs. Garrett & Maus you get served as few sportsmen do in the rural regions. The fare is

really excellent; all the delicacies of the season and many out of season. Fresh country butter and real cream, the finest bread, coffee that would put to blush the caterer of many a French *café*, with his muddy decorations, vegetables; good things clear through in short, not short in quantity, though. You can even have a hot breakfast sent out to you on the rocks. And the beds, they remind one of home, sweet home. There's no place like home, except the Great Falls in the fishing season. It is good for the piscatorial stomach to be at the Falls lately, especially when said stomach is in a ravenous state, as it is sure to be after its owner has been out on the rocks a few hours. Then's when you get an edge onto it! They have something there, too, for the kind of a thirst described by our army friend on the plains. Coming in from a ten day Indian scout in the "rainless region," he was offered water. He indignantly declined it, saying, "I've got a thirst on that I wouldn't take a thousand dollars for." And all for two dollars a day. Not the thirst of the major, but the accommodations of Garrett & Maus, with valuable information and advice to the sportsman thrown in, for these be good fellows and anglers.

Professor S. F. Baird, the eminent scientist and Fish Commissioner of the United States, to listen to whom quickly convinces the listener that the Professor is a true lover of the piscatorial art and at the same time a practical man in his treatment of the question of fish culture for food, which important subject is committed by the Government to his care, says the Great Falls will yet be one of the finest leases on the continent. He has unlimited faith in the success of his project for stocking the Potomac and its tributaries with the California salmon, regarding the experiment of hatching as certain in its results as putting eggs under a setting hen. Hence his confidence. When these salmon are ready for the hook three years hence may we three be those to hook 'em. Yours linally, O. K. and Bob.

—A correspondent sends us the following notes from Texas:

GALVESTON, Texas, May 10, 1874.

EDITOR FOREST AND STREAM:—

We have just passed through from our game season of geese, ducks, brant, curlew, snipe, and plover to the piscatorial element. The rage just now is to rig out a bamboo pole, float and couple of hooks, with the finest of sinkers, all perhaps costing a dollar, and purchase your shrimp for bait and start at a tearing rate seven miles to the railroad bridge, arriving there at daylight. Fasten your steed, and walking a short distance on the structure, proceed to cast your hook in the limpid waters below. Not long to wait; the wary trout, seeing so delicious a morsel as a shrimp dangling so prettily, goes for it with distended jaws, takes it, and off he goes. Now is the time to hook him, and by a peculiar skillful maneuver he is secured and presently landed in your basket. This is repeated until you bundle up and go back to the city; sometimes, and very often, with a handsome mess of large fine speckled trout. The railroad bridge is two miles long, and is one of our communications to the main land, made by piles driven into the sand and mud bottom. In its structure some thousands of piles are used, and fish congregate there to feed in immense numbers from all parts of the bay, and as many as 200 have been caught in a single morning by amateurs. The trout is our gamiest fish. I have seen them upwards of 24 inches in length and some 3½ to 4 inches thick, with the shiniest of scales and prettiest of speckles. Jointed rods are not much used here, and none but the fanciest of amateurs go in for fine metal hooks or fine and costly silk and grass lines. There has been quite an extensive raid upon the bridge fishing this season. Perhaps a hundred persons might be found enjoying the sport this morning. Our redfish, which weigh from 2 to 40 pounds, are caught on the beach with a good stout line 175 feet long, two hooks and a pound sinker, thrown out into the surf. It wouldn't be long before your captive would bite, and either you would get him or he would get your hooks and line. Our market is supplied by fishermen who seinc up and down the bay and among the numerous islands. They generally sell to middle men, who lay their dead fish on stalls in the market early in the morning. A redfish commands about 75 cents of six and eight pounds. What is left of the morning's supply is sometimes put on ice and taken the next morning, but most of the time is carted overboard. Many parties have tried boats with wells, and others large fish boxes to endeavor to keep them alive, but they all failed, and the same mode is in vogue to-day that existed thirty years ago. Why they failed no one knows, but fish cannot be kept alive. Live fish cannot be bought. Fish are so very plenty that with a seine 150 yards long and 5 feet deep, two men in one haul can make a catch of perhaps as many as 50 good-sized ones from 6 to 20 pounds each, as much as they can carry to market and dispose of. I do not know of any place where parties can go into the water, and with a long, lumbering seine, have such luck. Beside our redfish, we have sheephead, trout, croakers, whiting, sand trout, perch, pig fish, angel fish, pompano, mackerel, mullet, and catfish. Some of these just named are not much sought for and are not saleable. Last, but not least, is our jew fish, a monster in weight. The first one caught this season turned the scales at 440 pounds. An American citizen of African descent caught him and received \$25 for his half-hour's work. The fish was cut up, steaks were sold, and the balance went to make jew fish chowder for half of the town at a popular and celebrated saloon on the Strand. You might think this fish pulls extremely hard, but when caught he is like an infant, and only makes his noise and terrible splash when safely ensconced in some boat a captive, and groans like a dying man in his struggles to escape. J. L.

HOW THE SERPENT GOT OVER EVE.—A Frenchman's account of the temptation and fall of our first mother, Eve, is graphic and interesting: Monsieur Adam—he wake up—he sees one belle demoiselle asleep in ze garden. Volla de la chance! here is something interesting. "Bon jour, Madame Iv!" Madame Iv, she awake—she hol' her fan before her face. Adam put up his eyeglass to admire ze tableau—zey made one promenade—Madame Iv she feel hungry—she see appel on ze arbre. Monsieur le Serpent se promene sur l'Arbre—make one walk on ze tree. "M. le Serpent," say Iv, "Weel you not ave ze bonté to peek some appel? J'ai faim." "Certainment, Madame," say ze serpent—"charmé de vous voir." "Hola, mon ami, ar'rretez vous!" cry Adam—"stop!—que songez vous faire—what madness is zees? You must not peek ze appel! Ze snek in ze tree he smile—he took one pinch snuff—he say, "Ah, Monsieur Adam, do you not know zere is nossing proheebet for ze ladies? Madame Iv, permeeet me to offere you some of zis fruit defendu." Iv she make one courtesy, ze Snek he fill her whole parasol wiz appel, he say, "Eritis, sicut Deus; eef M. Adam will eat ze appel he weel become like one dieu, know ze good and ze evil; but you, Madame, could not become more of one goddess than you are now." And zis feenish Madame Iv.

BROOKLINE ROWING CLUB.—At the late annual meeting of this club in Brookline, Mass., the following officers were elected for the ensuing year: President, Samuel P. Train; secretary and treasurer, Frank Dupee; directors, Edward F. Chaum, W. S. Cutler, S. P. Train.

—The six-oared barges of St. Stephen's College had their annual race near Barrytown Saturday, over a mile and a quarter course. The Rosalie beat the Miramonte a length and a half. Time, 8 minutes 50 seconds. The Miramonte had been the victor four years in succession.

—When is charity like a top? When it begins to hum.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

SEAWANHAKA YACHT CLUB.

—We print below two circulars sent by the Seawanhaka Yacht Club to yacht owners who have been invited to participate in the Corinthian regattas inaugurated by this club. The first letter gives all the details of the proposed race for cabin sloops to take place at Oyster Bay on the third of July next, and the second letter is an appendix to the circular published in a recent number of the FOREST AND STREAM, referring to the Corinthian regatta for schooners to be sailed at Newport next summer.

FLAG OFFICERS PRIZE FOR A CORINTHIAN RACE BY CABIN SLOOPS.

NEW YORK, May, 1874.

DEAR SIR:

The Flag officers of the Seawanhaka Yacht Club propose offering a silver prize of the value of \$250, to be sailed for by cabin sloop yachts on the 3d day of July next, at Oyster Bay, L. I.

The race will be conducted on the Corinthian system. That is to say, each yacht must be sailed and, as far as possible, steered by her owner, and manned exclusively by amateurs.

Each yacht entering for this race must belong to an organized yacht club, and be manned, as far as practicable, with members of the club under whose flag she enters.

Owners of yachts entering for this race will have the privilege of including in their crews gentlemen who do not belong to the club from which they enter.

The race will be sailed according to the sailing regulations of the Seawanhaka Yacht Club.

Time allowance will be calculated on the basis of mean length and greatest breadth.

Only fore and aft sails can be carried.

Each competing yacht may carry its regular sailing master; but such sailing master will not be permitted to direct in any way the management of such yacht, and any owner infringing this rule will be deemed to have abandoned the race and forfeited the prize accordingly.

The owner of each yacht entering for this race must hand to the committee having charge of the race, on or before the 2d day of July next, a list containing the names, occupation and addresses of his proposed racing crew, and such committee will have the absolute right to reject from such list anyone they may consider a "professional."

Each yacht will be allowed to carry (exclusive of the owner) one man for every five feet of length on deck and fractional part thereof.

Unless the definite and positive entry of at least five yachts is received by June 15th, the whole project will be abandoned.

The object of this proposed race is to bring the subject of Corinthian racing prominently before our many yachtsmen and thereby popularize the system.

This mode of racing has been popular in England for many years; and has been found to develop very materially practical seamanship among the owners of yachts; and while it has enhanced the pleasure of those who did not own yachts, it has also served to awaken in them a greater interest in their respective clubs.

The foregoing remarks embody the principal features of the proposed race, but full information as regards details will be furnished by the secretary, Mr. Frederick deP. Foster, No. 65 Wall street, N. Y., to whom all entries should be addressed.

It is hoped that there may be a general response to this circular from owners of our sloop yachts, and that the entries may be numerous.

You are respectfully requested to enter your yacht for this race, and also to notify the committee, at your earliest convenience, whether you intend so to do. Very respectfully yours,

WM. L. SWAN,
J. WM. BECKMAN, JR.,
SAM'L J. COLGATE,
FRED. DEP. FOSTER,
WM. FOULKE, JR.,
M. ROOSEVELT SCHUYLER,

Committee.

To ———, Sloop Yacht ———.

NEW YORK, May 21, 1874.

DEAR SIR:—

As the details of the proposed Corinthian race at Newport have been gradually matured, it has been deemed advisable to modify the restriction requiring that the competing yachts shall be manned exclusively by members of the club under whose flag they are entered for the race.

It has been intimated by several yacht owners that they would like the privilege of including among their crews gentlemen who were not members of the club from which they proposed to enter their yachts for the race, and the committee has decided to allow the same.

Trusting this may facilitate your preparations for the race, the committee would esteem it a favor if you would inform them at your earliest convenience whether it is your intention to enter your yacht, in order that they may be enabled to definitely complete the arrangements for the race. Very respectfully yours, &c.,

WM. L. SWAN,
J. WM. BECKMAN,
SAMUEL J. COLGATE,
FRED. DEP. FOSTER,
WM. FOULKE, JR.,
M. ROOSEVELT SCHUYLER.

To ———, Schooner Yacht ———.

OPENING CRUISE OF ATLANTIC YACHT CLUB.—Notwithstanding the heavy fog which prevailed the greater part of the day, on Saturday, May 30th, the Atlantic Yacht Club held their opening cruise down the bay. Owing to the unavoidable absence of a number of the yachts, the fleet was not as large as had been expected but at the appointed time the schooner "Triton" Mr. G. L. Thayer, the "Orion" Mr. Cooper, "Alert" Mr. Henry Vail, and "Kate" Mr. L. Lawrence reported to Commodore Maxwell, on his flag ship the "Peerless," and the fleet got under way with a nice southerly breeze to beat down to Sandy Hook. The "Peerless" eventually took the lead and was the first to let go her anchor near the Horse Shoe, where she was shortly afterwards joined by the other yachts, the squadron having been increased on the way down by the arrival of the little "Barbaba Frietchie," Mr. J. H. Rhodes. Here luncheon was served, shortly after which the yachts started on their return trip. The fog at this time was quite thick, and a little additional excitement was added by the sound of various fog-horns and the knowledge that the Saturday fleet of European steamers

was at that time groping its way down the bay. No misfortune occurred, however, and on reaching the "Narrows," the fog having cleared away, numerous yachts were to be seen standing across in all directions, among which were the "Idler" Rear Commodore S. J. Colgate, of the Swanhaka, Y. C., with his Corinthian crew, the "Columbia," "Magic," "Torolinta," "Gracie," "Sadie," the steam yacht "Ideal," and the new schooner "Cornet," Mr. Langley, which has been described in the columns of FOREST AND STREAM, and was designed by Mr. Phillip Ellsworth. She is a pretty looking vessel, and is expected to develop great speed. On the return trip off the wind the "Triton" was the successful yacht, dropping anchor about two minutes ahead of the Peerless; the rest of the fleet arrived within a few minutes, and disembarking their guests ended a most successful day's cruise.

—The Brooklyn Yacht Club will hold their seventeenth annual regatta on Tuesday, June 16th. The steamer "Seth Low" leaves the barge office foot of Whitehall street, New York at 8 30 a. m.; foot of Court street, Brooklyn, at 9 30 a. m.

—We mentioned in a recent number of the FOREST AND STREAM the yacht that Mr. J. N. Town has designed and is now building for Mr. George Barclay Ward, but considering the mission this yacht is intended to fill, she is worthy of a much more comprehensive statement. She is to be called the Aida, and when finished, which her builder hopes will be the early part of this month, will be sent immediately to England, there to test whether the broad or shallow is better than the narrow and deep type of boat. Being purely an American vessel, it is obvious that her chances of winning are very much curtailed by the English system of measurement which assumes her depth to be one-half her beam and thereby makes her much larger than she really is, and on the same theory reduces the size of her probable antagonists very much below the reality. We believe her owner understands thoroughly the work that is cut out for him to do, but in matching a vessel of the size of the Aida against the Vanessa, Quickstep or other flyers among the twenty tonners, he is making an attempt the result of which, to say the least, is highly problematical. It would seem a pity at first thought that Mr. Ward has not adopted the American sloop-rig, which, unless the water in all his regattas is too hilly, would probably give his vessel a better chance, but on the other hand, using the cutter rig, the same as his competitors, reduce the result of each race to a question of model only, and he has the satisfaction of possessing a serviceable seamanlike rig. The Aida will be a keel boat owing to some regulation of English yacht clubs which severely handicaps all center board yachts, but, in point of fact, she is the American type of center board yacht having a deep fixed keel in place of the board. She will have a sharp but still full entrance, with little or no hollow in the water lines—small shoulder, considerable dead rise, hollow floor, very easy run, and an overhanging stern after the English fashion. She is double framed with Hackmetack, has keel, keelson, &c. of oak, and is planked with oak. Her trunk cabin will be narrow, leaving considerable gangway on either side, and about sixteen inches high; abaft the trunk will be a shallow cockpit seven feet long by seven feet in width. She will take about four tons of lead for ballast. The following are the principal dimensions:—Length on water line, thirty six feet eight inches; length over all, forty-four feet; depth of hold, five feet ten inches; moulded beam, thirteen feet ten inches; extreme beam, fourteen feet one inch; draft aft, five feet; draft forward, four feet; freeboard, two feet two inches; sheer plank rising, two feet forward and eighteen inches aft; she will have a nine inch rail and will have a perpendicular stern post; her mast from heel to cap will be forty feet in length; boom, thirty-eight feet; gaff, twenty-three feet; top mast from heel to truck, twenty-five feet; doublings, five feet; bowsprit, twenty feet outboard. Should she be successful against the heavy odds with which she must contend, it will certainly reflect great credit upon her designer. The English system of measurement seems most unaccountable to us, for in point of fact, it is no measurement whatever, and we frequently find their yachts carrying in ballast alone, weight equal to their nominal tonnage. However, on the theory that their present measurement has produced some excellent vessels, they seem unwilling to make any changes whatever. Another argument used, that their racing fleet has been constructed upon the basis of their present measurement, would not carry much weight with it if cubical contents—as used by the N. Y. Y. C.—were permitted to supplant their existing system.

—The Madeleine, Mr. J. Voorhis, Jr., and the Palmer, Mr. Rutherford Stuyvesant, have both formally entered for the Corinthian race for shooners to be sailed at Newport next August.

—A young lady of Portland has purchased the fast yacht "Spy" and is fitting her up for the present season, intending to enjoy, accompanied by another young lady, a "life on the Ocean Wave."

—Commodore Holt, of the yacht Sea Witch, we see by the Nantucket Inquirer, is announced as the first arrival at that port with several distinguished voyagers, including Wm. L. Strong, of New York, Thomas Barbour, of Paterson, Wm. A. Griswold, of Philadelphia, and several other gentlemen.

—Binnacle, our Boston correspondent, sends us the following items under date of May 31st:—

The "Addie Elmer," of Lynn, Capt. Allan Hay, has been added to the Dorchester Yacht Club.

Capt. W. H. L. Smith has been making some alterations in his staunch yacht "Alice" rounding out the bow on the water line and fitting a new mast.

The three regattas to decide the championship of the various classes in the Dorchester Yacht Club are appointed to come off June 6th and 20th, and July 18th, to be sailed over the usual courses. Prizes in each class to be solid silver cups.

The time of the annual cruise is still undetermined, but it is proposed to cruise in the direction of Portland this year, as last year the club went to Provincetown, and of course want a change, and new sights and harbors to see.

The Dorchester Yacht Club regatta May 21st was not a success in point of the number of boats, but it showed the pluck and seamanship of the amateur crews that did enter, and was an example worthy to be followed by clubs owning larger boats. The southeast storm was anything but pleasant to be out in, even on shore. The wind came in sharp puffs, and the rain at times struck like so many pellets of shot.

The account of the race you have already seen, and the settlement of the disputed prizes is herewith appended:—

DORCHESTER YACHT CLUB REGATTA.—A meeting of the judges of the last regatta of the Dorchester Yacht Club on May 21st was held Tuesday 26, to investigate into the protests made by the Secret against the Firefly for fouling, and that of the Sunbeam against the Fearless for shifting ballast. Neither protest was allowed. The entire list of prizes awarded were as follows:—

First class schooners.....	Curlew.....	S. L. French.
Second class keel sloops.....	Fearless.....	J. A. Woodward.
First class centre board sloops.....	Kelpie.....	S. S. Capen.
Second class centre board sloops.....	Firefly.....	G. H. Balch.
Third class centre board sloops.....	Waterwitch.....	H. K. Pettengill.
Fourth class centre board sloops.....	Tulip.....	Walter Burgess.

The next regatta, being the first championship regatta of the present season, will take place from Commercial Point on Saturday, June 6, at half-past two o'clock P. M.

—The schooner yacht Banshee, Capt. W. J. Orcutt, sailed Saturday on a month's cruise "down East." The sloop yacht Startle, Capt. Plummer, joined her the first of this week, with the intention of making an extended cruise in the same direction rendezvousing in the Kennebec River and at Mount Desert.

—The Intercollegiate Regatta, which will take place on Saratoga Lake on July 15th and 16th, has every evidence of being one of the most successful aquatic pageants that has ever been managed in this or any other country. The following are the crews of the different colleges and universities, subject to alterations:—

DARTMOUTH COLLEGE.

Their average weight is 160 pounds, and height 6 ft. one third inch.

PRINCETON COLLEGE.
Princeton College sends a crew this year for the first time. Messrs. T. Sheldon, J. Taylor, R. J. Hall, F. Bidle, F. Marquand, W. M. Smith, I. Conger, C. Cross, F. Markoe, and W. H. Addicks are all under training, and from them the University crew is to be selected. The ten named average slightly over 150 pounds. The Princeton crew will be at Curtis', on the east side of the lake, a little south of Yale's quarters.

CORNELL UNIVERSITY.
Cornell University, Ithaca, N. Y., has selected its men, but as yet has not decided upon their positions in the boat. Messrs. J. N. Ostrom, J. H. Southard, C. C. King, Corwin, Garver and Perry Clark will compose the University crew, with Ostrom or Southard for stroke. Ostrom, Southard, and King were all in last year's crew, King being the stroke. The crew will be quartered at J. Ramsdill's, on the lake, a short distance from the Harvards.

—The Harvard University class races took place on May 30th on the Charles river course, and quite a large number of the friends of the college boys assembled at the Union Boat Club house to witness the sport. The weather was lovely, and the river almost as smooth as glass. The sport was opened with a single scull race between P. Dana and F. Stone. Dana shot ahead and kept the lead all the way, completing two miles in just 16 minutes, winning the race quite easily.

The next race was between the second crews of the junior and sophomore classes, the freshmen not appearing. The "sophs" were very reluctant about starting, as they were much in want of practice, but finally decided to contend on condition that the juniors give them one minute time allowance and allow them a coxswain, the juniors rowing in a barge. This race was over the two-mile course, and was won by the juniors. Time—15 min. 41 sec.

The first crews then brought out their shells and made ready for their race, a distance of three miles. As the University crew appeared they were heartily applauded, and taking a few strokes up the river, showed that they were in fine condition. Positions were drawn with the scientific crew inside, nearest the wall, then the freshmen, sophomore and University crews in the order named. When the word was given the University boys bent to their long, steady stroke and were not long in taking the

inside, cheers and class shouts being dealt out liberally to all the classes as they moved up the river. On the return it was seen that the University crew were easy winners, though the "sophs" were not far behind. The scientific boys were pretty well up with the "sophs," but the freshmen were left far out in the cold, though they were applauded by their friends when they came up.

University—H. R. Dana (stroke,) Bacon, Goodwin, Morse, Taylor, Otis (bow.) Color, magenta. Time—20 minutes 13½ seconds.

Sophomore—Riggs (stroke,) Richards, Bolan, Brown, Green, Weld (bow.) Color, red. Time—21 minutes 5 seconds.

Scientific—James (stroke,) Perkins, Thayer, Irving, Denton, Davis (bow.) Color, white. Time—21 minutes 22½ seconds.

Freshmen—Hamman (stroke,) Martin, Parsons, Patten, Harwood, Wiley (bow.) Color, white. Time—22 minutes 30½ seconds.

The judges were Messrs. T. Parsons, J. Weld and G. F. Roberts.

—The Atalanta and Gramercy Boat Clubs sent five men from their respective associations on Saturday, May 30th, to represent them for the single scull junior championship gold medal, presented by the officers of the Club. The race was three miles out from the powder-boat off the railway bridge to Morris Dock, Harlem River. J. F. Englehardt was appointed referee and starter. A good start was made at twenty-nine minutes past five, in the following order, the favorite leading: E. B. Welch, E. J. Atkinson, A. Geisman, F. Wynne, and H. R. Mills.

The men retained their position for half a mile, when Geisman shot ahead and passed Atkinson, who in a spurt ran his boat on a sandbank and was afterwards nowhere. Geisman reached the stake-boat two lengths ahead of Winne, and Welch followed half a boat's length behind Winne, Mills being fourth. The badge has to be rowed for every four weeks during the season, and whoever wins it the most times will be the owner. After the men had returned to their club-house, Charles Peverley presented the medal to the winner.

—The Atalanta and Yale College crews will row on Lake Saltonstall on the 25th of June. It will be a three mile race in six-oared gigs. The following crew has been agreed upon to represent the Atalanta Club:—

R. Withers, 155 pounds, stroke; Theodore Van Raden, 153 pounds; William Spear, 140 pounds; Oliver T. Johnson, 155 pounds; Alexander Handy, 155 pounds, and Edmund I. Blake, 138 pounds, bow. Withers, Van Raden, and Handy rowed against Yale and Harvard, and in the English race when they were beaten.

New Publications.

Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.

GERDA. A Novel. By Maria Sophia Schwartz. Philadelphia: Porter & Coates.

This is the latest novel by this popular authoress. It possesses all the requisites to make a very interesting work of what is termed a dry subject. Work is the foundation of this novel, and the true ennoblement of labor, when rightly pursued, is made conspicuous in the lives of the "Children of Work." Our lady readers can with safety peruse the character and copy the principles of Gerda, and with profit follow in the footsteps of the quiet heroine. Circumstances, as governing several lives, are well handled, and although we are kept delightfully in the dark, at the end cometh light and we are satisfied. Although the authoress makes no pretensions to a tragic story, she, in the final disposition of Stormberg and the Professor, realizes the reader's ideal of the kind of justice that should be done even in a novel. True merit, as displayed in the lives of Gustafsson and Brother, and of Richard, the Professor's pupil, inculcate to the fullest the soundness of the sentiment, "Learn to labor and to wait." We can earnestly recommend this work as one of the best by our popular authoress.

We have quite a number of other works by Harper & Bro., all of which we shall notice in due course of time.

THE PARISIANS. By Lord Lytton. New York. Harper & Bros.

Undoubtedly this work, standing as it does deservedly high in a literary point of view, will be the subject of many and very dissimilar criticisms. Every man will look from his own idealistic standpoint upon this last work of the great novelist. Were it as easy to praise as to blame, this work would be preserved in panegyric. As a mere love story it falls below the author's best standard. Philosophically noted, it may be placed about on a par with the author's previous works. The principal fault we note in the otherwise very pleasant work, is attempting to sketch too many characters. He fails in sketching his higher or gentlemanly characters; but holds a graphic pen when he writes of the varied social types of lower life. Here he is bold, true, and we love to follow him in thought and description.

AMERICAN TEXT BOOKS OF ART EDUCATION. By Prof. Walter Smith, State Director of Art Education for Massachusetts. Boston. Jas. R. Osgood & Co.

The greatly increasing demand for correct manuals upon the science of art education, as developed in the plan of Professor Smith for the use of common schools and general learners, will be highly appreciated upon examination. "Some good system, some reliable guide we much want at the present time," said a teacher to me some few weeks ago. I recommended to him, as I do to every one, Smith's series. He uses it to-day, and says "it is just the work wanted by young and old." Having had some years experience in the application of all the principles of the art of drawing, as laid down by Professor Smith, we can cordially recommend the same as the best series of drawing books for the use of common schools, academies, and for art students.

THE CIRCUIT RIDER. By E. Eggleston. New York. J. B. Ford & Co.

This is the complete work, in book form, begun in the *Christian Union*, and is entitled "A Tale of the Heroic Age." It is a forcibly written work, embodying the varying scenes which took place in the early times in the life of a Methodist Circuit Rider. The author has well depicted the many trials and curious incidents attendant upon a pioneer preacher's life years ago, among a rude and illiterate people; one will learn much of what Methodism was in Ohio in this century, and the great contest existing between the old Methodism of those times of pristine worship in the open air, and the Methodism of to-day, as discussed in its magnificent latter day temples. A good book, and one that does credit to its author and publishers.

ANNOUNCEMENTS.

Porter & Coates have in press and will shortly publish "Valentine, the Countess." Translated by M. S. from the German of "Carl Detlef." Also, "No Alternative," a novel by Annie Thomas; and an exceedingly interesting novel called "The Vicissitudes of Bessie Fairfax." By Helen Lee (Miss Harriet Parr). This last is said to be a work of great merit.

PRIZE LIST.

FOREST AND STREAM
A Weekly Journal,
DEVOTED TO
Out-Door SportsHunting, Fishing, Yachting, Boating, Practical Nat-
ural History, Fish Culture, &c. &c.

MANLY and ATHLETIC EXERCISES,

AS OF
FISHING, SHOOTING, ARCHERY, CRICKET,
FOOTBALL, and CROQUET.Offer the following prizes for clubs of three or more
Single Subscription per Annum \$5**Starting Clubs.**—Agents, and others interested, are
advised that we do not insist upon their starting with
full clubs to secure our rates. They can send three
or more at a time, and on forwarding the requisite
number within 60 days will be entitled to same premi-
ums as if all were sent together.

CRICKET.

For \$20 00 four copies, one year, with one best
spring bat, one College bat, one Dark cricket ball;
price \$7 50.For \$25 00, five copies, one year, with a complete
cricket set; one College bat, one polished bat, Clap-
shaw; one Dark cricket ball; one set of stumps; price
\$12 00.

FOOTBALL.

For \$15 00, three copies, one year, with one Rugby
football; price \$6 00.

FISHING RODS.

For \$15 00, three copies, one year, with one superior
four joint light rod, suitable for all kinds of fishing;
price \$7 00.For \$60 00, twelve copies, one elegant rod; suita-
ble for trout, black bass with fly, or for trolling bass
or pickerel; as fine a rod as can be made; German
silver tipped, with three tips; price \$25 00.

CROQUET.

For \$20 00, four copies, one year, with very hand-
some set of croquet; price \$7 00.For \$25 00, five copies, one year, with superb set of
croquet; price \$10 00.For \$30 00, six copies, one year, with the finest set
of croquet made; price \$14 00.

REMINGTON RIFLE AND SHOT GUN.

For \$75 00, fifteen copies, one year, with one Rem-
ington Deer rifle; price \$28 00.For \$100, twenty copies, one year, with one Target
rifle, 33-inch octagonal barrel, to be used for sporting,
hunting, or target shooting; price \$36 00.For \$100, twenty copies, one year, with one Rem-
ington double barreled, breech-loading shot-gun,
one of the best guns ever offered to American
sportsmen; price \$45 00.

SHARPE RIFLE.

For \$100, twenty copies, one year, with one Sharpe
porting or target rifle, best quality; price \$40 00.

WARD-BURTON RIFLE.

For \$200, forty copies, one year, with one Ward-
Burton rifle magazine gun for large game, price 80 00.
**SINGLE AND DOUBLE BARREL MUZZLE
LOADING SHOT GUNS.**For \$20 00, four copies, one year, with one American
single barrel gun, perfectly safe, blue barrels, walnut;
price \$10 00.For \$35 00, seven copies, one year, with one Ameri-
can double gun, handy and reliable gun every way;
price \$18 00.For \$50 00, ten copies, one year, with one double
boys' fine twist barrel gun, a safe gun every way for
boys; price \$26 00.For \$75 00, fifteen copies, one year, with double
gun, English laminated steel barrels, handsome fin-
ish; price \$45 00.

CASH PREMIUMS.

To those who prefer cash premiums a discount of
25 per cent. will be made on all clubs of three and up-
wards.Every article is of the finest quality and will be
sent free of expense.**Remitting Money.**—Checks on New York City
banks and bankers are best for large sums; make pay-
able to the order of FOREST AND STREAM PUBLISHING
COMPANY, 103 FULTON STREET, NEW YORK. Post
Office Money Orders for \$50 or less are cheap and safe
also. When these are not obtainable, register letters,
adding stamps for postage and registry; put in the
money and seal the letter in the presence of the post-
master, and take his receipt for it.Send the names with the money as fast as obtained,
that subscribers may get the paper at once.

Miscellaneous

Orange Sporting Powder.

ORANGE LIGHTNING POWDER,

The strongest and cleanest Powder made. Nos. 1
to 7, packed only in sealed 1 lb. canisters. The coarser
sizes especially are recommended to owners of fine
breech-loading guns, giving great penetration with
very slight recoil.

ORANGE DUCKING POWDER,

For water fowl. Very strong and clean. Nos. 1 to
5. Packed in metal kegs of 64 lbs. each, and in canis-
ters of 1 and 5 lbs.

AUDUBON POWDER,

Very quick For woodcock and quail Nos. 1 to 4.
Packed in metal kegs of 12½ lbs. and 6½ lbs., and in
pound canisters.

ORANGE RIFLE POWDER,

The best for rifles and for all ordinary purposes.
Sizes F.g, F.F.g, F.F.F.g, the last being the finest and
most used. Packed in wood and metal kegs of 25
lbs., 12½ lbs., and 6½ lbs., and in canisters of 1 lb. and
½ pound.All of the above give high velocities and less resid-
uum than any other brands made.

Ask your Dealer, or send direct to our

works for a supply of PURE Tobacco

VIENNA, AUSTRIA, Nov. 30, 1873.

Messrs. Wm. S. Kimball & Co.:

Sirs—A friend of mine sent me, with a transport

of Indian Skulls, two pounds "Vanity Fair," which I declare

to be the best Tobacco I ever smoked. We have very good

tobacco in Vienna—Turkish and Hungarian, but "Vanity Fair"

is the King of all, by its aromatic flavor and the right sort of

strength. My friend in New York got an appointment in

California, by that reason. I apply immediately to you, begging

you to send me for the enclosed ten dollars, a supply of "Vanity

Fair," and send with the next steamer to Germany. If there

is a German firm that sells your excellent "Vanity Fair," I

beg you to enclose me the address.

The above rifle was the winner of all the prizes for accurate shooting at Creedmoor at the last spring meeting. 103 out of 123 at the fall meeting, "Turf, Field and Farm" Badge, 3 out of 4 times. Amateur Rifle Club Badge (final). Diamond Badge, first and only time. For authentic record of above see N. R. A. First Annual Report, just out. At the match Saturday, 16th inst., 7 Remington and 7 other rifles were used, resulting in a score of 302 for Remington and 287 for the others, giving Remington's 15 gain, or two points to each man. For full particulars of these rifles address

E. REMINGTON & SONS, 281 and 283 Broadway, N. Y.,
OR ARMORY, ILION, N. Y.

This arm was submitted in competition with over one hundred different systems, American and European, to the Board of United States Officers, appointed by Act of Congress, 6th June, 1872, for the purpose of selecting the best arm for the service, and of which Brig. Gen. A. H. Terry was President. It successfully passed through all the tests.

The following is the report of the Board:
"Resolved, That the adoption of magazine guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing breech-loading arms, and shall at the same time possess a safe and easily manipulated magazine, every consideration of public policy will require its adoption."

Resolved, further, That the experiments before the Board with the Ward-Burton Magazine System have so impressed the Board with the merits of this gun, that they consider it as more nearly fulfilling the conditions above specified than any other tried by them or of which they have any knowledge, and it does recommend that a number of magazine muskets be made on the plan for further trial in the field." (See Ordnance Report.)

We are now receiving orders for these guns, and due notice will be given in this paper when they are ready for delivery.

The following is our scale of prices: Special Magazine for large game, carrying from 3 to 8 cartridges, 70 to 85 grs. of powder, 350 to 400 grs. of lead, 8 to 10 lbs. weight, from \$60 and upwards, according to finish. Special Long-range Magazine Rifle for Creedmoor shooting, 90 grs. of powder, 480 grs. of lead, carrying 3 to 8 cartridges, weighing 10 lbs., from \$100 and upward. Magazine guns for general use, carrying 3 to 9 cartridges, 60 grs. powder, 350 grs. lead from \$40 and upward. Single Breech-Loader, Creedmoor shooting, for long range, 90 grs. powder; 480 grs. lead, from \$60 and upward. Single Breech-Loader for general use, 6 to 7 lbs., 60 grs. powder, 350 grs. lead, from \$30 and upward. The calibre of all our rifles, unless otherwise ordered, will be 45-100 in.

All communications should be addressed to

Care Ward & Co., 34 Wall St., N. Y.

FISHERIES.—MADE TO ORDER for the trade. Every variety of Net, Seine, Dredge, &c. suited to Sea, Lake, Pond or River. AMERICAN NET AND TWINE CO., Boston. *5-6m

Hall's Patent Creasers

FOR PAPER SHELLS.

THE "CLIMAX" CREASER, combining Creaser, Loader and Cap-Expeller, forming the most complete implement in the market. Is also an excellent Loader and Cap-Expeller for Berdan and other metallic shells. Price, \$2 75. Sent by mail post-paid. Extra cylinders, 75 cts. Extra needles, 15 cts.

Plain Creaser and Loader—Improved Pattern.
Works rapidly and effectively. Price \$2 25. Sent by mail post-paid. Extra cylinders 40 cts. each. In ordering either of the creasers give size of shell used. For sale by Gun Dealers. Address HALL & CO., 40 North Duke street, Lancaster, Pa.

J. C. CONROY & CO.,
65 Fulton Street, New York.

IMPORTERS AND MANUFACTURERS OF

Fish Hooks and Fishing Tackle.

Would invite the attention of amateurs to their large stock of fine goods, specially prepared for the wants of those visiting the Long Island Clubs, the Adirondacks, Lake Superior, the Maine woods, and the Black Bass regions. A full stock of their unrivalled Fly rods for Trout and Salmon, and the famed "McGinnis" Black Bass Rods constantly on hand.

Nine Silver Medals and the only Gold one ever awarded were received by them for the superiority of their goods.

D. HODGMAN & CO.,

1209 Elm st., Manchester, N. H.

Miscellaneous.

COLLINGWOOD
—AND—
Lake Superior Line.

Toronto, Collingwood, Fort William,
Duluth, Eort Garry.

Comprising the four First Class Upper-Cabin powerfu
Side-Wheel Steamers

Chicora,
Frances Smith,
Cumberland,
and Algoma,
Having Splendid Drawing Room Cabins, in connection
with the

NORTHERN RAILWAY OF CANADA,

Leaving Collingwood every Tuesday and Friday
on arrival of Steamboat Express Train, with Drawing
Room Cars attached, calling at

Owen Sound, Bruce Mines, Sault Ste. Marie,
Michipicoton, Neepigon, Silver Islet, Prince
Arthur's Landing, and Duluth.

Fort Garry and the North-West!

With direct connections at Thunder Bay with DAW-
SON'S ROAD TRANSPORTATION COMPANY for
Fort Garry, and at Duluth with Northern Pacific Rail-
way for Moorhead, and KITTSON'S RED RIVER
LINE for Fort Garry and

The Red River Country.

Pleasure Travel.

This route embraces the most enjoyable and pic-
turesque Summer Tour, by making the circuit of Lake
Superior with the sheltered and beautiful waters of
the inside channels of Lake Huron and Georgian Bay,
and thence by three hours' rail with magnificent par-
lor cars to Toronto, connecting with the Royal Mail
Daily Line of Steamers on Lake Ontario, and the
Grand Trunk Railway, for the THOUSAND ISLANDS
and the Rapids of the River St. Lawrence, for Mont-
real, Quebec, White Mountains, Portland, Boston, and
all points East and South; and with the Great West-
ern Railway and Lake Ontario Steamers, daily for
Hamilton, Niagara Falls, Suspension Bridge, Buffalo,
Detroit, and all points West and South-West.

Cheap Excursions

Will be made during the Summer Season, in the
months of June, July, August and September, afford-
ing ample opportunity for visiting the Great Mineral
Region of Lake Superior and the FISHING GROUNDS
of Lake Neepigon.

Connections throughout punctual and certain.
State Rooms can be secured at Central Passenger
Offices, Toronto, and all information given by

CHAS. PERBY, 62 King street East, Toronto.
D. MILLOY, 8 Front street East, Toronto.

THE NEW AND ELEGANT STEAMERS

Rhode Island, CAPT. WM. M. JONES,

Narragansett, CAPT. RAY ALLEN,

Stonington, CAPT. JESSE MOTT,

FORM THE FINEST FLEET OF SOUND
STEAMERS LEAVING NEW YORK.

Not a Trip Missed in Six Years!

Daily from Pier 33 N. R., foot Jay st.

AT 5 P. M.

SPECIAL NOTICE.—The new and magnifi-
cent steamer RHODE ISLAND, will on and after JUNE 22d, leave Pier 30
North River, foot Chambers street, at 12 o'clock,
noon, and Pier foot 23 street, East River, 1 P. M., ar-
riving in Boston the same evening, affording passen-
gers a sail through

Long Island Sound by Daylight.

RETURNING—Train leaves Boston at 8 P. M.,
connecting with the RHODE ISLAND at Stonington
at 10-45 P. M., and arriving in New York at 6 A. M.
EXCURSION TICKETS to Stonington and back,
same trip, \$3. L. W. FILKINS,
General Passenger Agent, Pier 33 North River.

HOME! HOME! HOME!!!
At Flushing, six miles from New York; 103
trains daily from 6 A. M. to 12 at night; a yearly com-
mutation ticket free.

(Fare 8c. by package tickets.)
For sale, a French slate roof House, filled in with
brick; gas, water, marble mantle; good closets; sewer
connections, with double plot of ground, guttered and
flagged.

Price \$4,000.
The owner intends to sell, and any party who can
invest in a home, from \$500 to \$2,500, will address Box
No. 142 Post Office, obtain a free pass to Flushing and
full particulars. Feb-2

LOOK AT THIS.—A beautiful country resi-
dence, consisting of eleven acres good land, good
dwelling, garden, barn and henney, within 20 miles
of New York city by rail; located in Westchester
county; good stream of water, with fall; three story
factory building, &c. The price is very low, and the
owner will take a mortgage for whole amount, 6pr ct.
interest, providing buyer will contract to construct
and maintain artificial trout breeding apparatus, or to
engage in approved manufacturing business, or to put
whole place in garden truck. None but respectable
parties need try to deal on this basis. Address
HICKORY, P. O. Box 3769, N. Y.

Terms, Five Dollars a Year.
Ten Cents a Copy.

NEW YORK, THURSDAY, JUNE 11, 1874.

17 Chatham St. (City Hall Sq.)

AN ANGLER'S INVITATION.

For Forest and Stream.

IF I'm a judge of jaded men,
Who need a check upon their preaching,
One Dr. B. should drop his pen,
And go where forest leaves are bleaching,
To angle and camp out.

Do not admire the springing grass,
Rejoicing in the vernal showers?
The dancing waters as they pass,
Invite to streams and woods and bowers
To angle and camp out.

The South is sending us warm gales,
And birds intent on jocund singing,
And they revisit hills and vales
To tempt us forth, our tackle bringing,
To angle and camp out.

A saw-mill dam to hang around,
Is but a place for lazy boobies!
We'll go where rocks and whirls abound;
Where tempting eddies glow like rubies,
To angle and camp out.

A wild and lonely forest night,
With bower built and fire before it,
Is truly a romantic sight.
A place to rest and chat and snore it—
To angle and camp out.

Forsooth the rain and lightning's gleam,
And thunder's crash may dash our trouting
As once they did on Pleasant Stream,
But we'll submit, disdaining pouting,
To angle and camp out.

Lift up your eyes and snuff the breeze,
And hail the fog and bless the morning;
Then feel your pulse and trembling knees,
And own you need no further warning,
To angle and camp out.

Yon soaring hawk, yon staring owl,
Yon crow his caws eternal pleading,
(Mosquitoes! whack! and with a scowl!)
Yon country boys and country girls,
Yon cat-birds, jays and nutting squirrels—
All stare at us two gents proceeding
To angle and camp out.

MONTPELIER.

Sports in California.

For Forest and Stream.

NO. II.—TROUT FISHING AT HUMBOLDT BAY.

IN my first number, although I alluded to outfit, and stated that all necessary information could be obtained in San Francisco, as clothing was not intended to be included in that term, and as the climate of California is peculiar—varying with each locality—I will add a few words on this subject.

For the Humboldt Bay country heavy clothing is indispensable at all times. Linen clothing, or, rather, the usual summer wear of "the east," is never needed. Whatever be the style, quality, or color of the outer dress, the material should be wool, and the goods should be strong, for the undergrowth is heavy, and will try the capabilities of the garb to the utmost. As to color and pattern, every sportsman has his own opinion, and the general principles of the harmony of colors are so accurately laid down and well known that little need be added, save that from the coast to the eastern side of the belt of redwood forest the foliage is evergreen. East of this redwood belt, in summer, the bare hills become the color of dead leaves—not the russet of our autumns, but a pale yellowish or whitish brown. The foliage generally is, however, still evergreen. A sportsman of no mean celebrity considers the color of "withered fern" the best, and when well worn and soiled with the vicissitudes of a month's tramp this color is certainly remarkably invisible at a short distance, as it blends so harmoniously with any and all surroundings. The famed Indian smoke-tanned buckskin, which is a rich russet brown, and is so generally used by Indians and hunt-

ers, cannot compare with it. At 500 yards this buckskin can be picked out at once; but take a well-worn and travel stained suit of the withered fern, and it will be a remarkably correct eye that can detect the wearer if he does not move, and this, too, if he be lying on the bare and open ground.

The climate of this favored region varies but little. The extremes generally are from seventy-two to seventy-six degrees Fahrenheit. During the two years I was stationed at Fort Humboldt, on two occasions ice formed nearly as thick as a pane of ordinary window glass, and was a matter of wonder to "the oldest inhabitant." A snow squall also once struck us, leaving a feathery impression on our parade about half an inch in thickness. All these instances happened during the night, the thermometer returning to its accustomed level by breakfast time next morning. The highest rise of the thermometer during my sojourn was eighty-two degrees, which occurred on one 4th of July. But the regulation temperature is, as stated, seventy-four degrees.

"The four seasons" do not obtain in the Humboldt Bay country. There are but two—the wet and the dry. In this respect the climate is remarkable; not in that a wet and dry season are unusual, but that at Humboldt it almost never rains during the day, even in the rainy season. During the dry season there may be an occasional shower, but very seldom. During the rainy season it rains regularly once every twenty-four hours, with but few exceptions; but the rain commences about ten P. M. and ceases about four A. M., and this with such regularity that one might almost set his watch by it. This is owing to the interchange of the land and sea breezes, and as these are regular in their rise and fall so is the rain in its commencement and cessation. It will rain tremendously every night, and all night, but the mornings will be as soft and balmy as May—bright, clear, and slightly hazy—an Indian summer day with the freshness of spring. They are absolute perfection. During my two years residence at Humboldt Bay it did not rain during the day more than ten times. The advantage of this peculiarity cannot be better appreciated than by the sportsman, and if he cannot guard against the nocturnal inundation, and make himself snug and keep dry, he must be helpless indeed.

As a result of this division of the seasons, and the uniformity of the temperature, vegetation is almost tropical in its luxuriance. The hills, ravines, and woods are covered and filled with a heavy undergrowth, which is bespangled with lovely flowers, and teems with berries of various kinds. The oleander and rhododendron are there in profusion, with a hundred others unknown to me by name. I have ridden through miles of the waxberry, once a great favorite in our eastern gardens. It is a wild shrub there. Of the edible berries I remember the salmon berry, which is like a large raspberry, but straw colored and tinted with red; the thimbleberry, the strawberry, the raspberry, the blackberry, the dewberry, the whortleberry, the bilberry, the partridge berry, the mulberry, the salal berry, the service berry, the redberry, and many others. The redberry is remarkable in that the tree which bears it grows to the height of twenty feet. It has a trunk of six feet, and a head like that of the osier willow, and these berries, which are of a brilliant crimson, semi-transparent, and about the size of the cranberry, are strung along the branches like currants on their stem. Their taste is slightly acid, and much like that of a currant, but more delicate. The leaves of the tree are small, and, I think, lanceolate; of rather a lightish green, like the willow, but darker. The tree has an open head, and in the sunlight the berries seem like little balls of transparent red candy, and present a very beautiful appearance. They make a fine jelly, highly prized by the ladies for its beautiful color and delicate flavor. When I left Humboldt I brought several jars of this jelly with me, but during my varied journeyings I found a warmer climate, and the jelly, fermenting, burst the jars, upon which my wife facetiously christened it "blew up jelly."

The lover of ferns would be enchanted with this coun-

try. The hillsides are covered with a profusion and wealth of variety seen nowhere else save in the tropics. From the tiniest and almost invisible form to the gigantic "tree ferns," their feathery fronds wave in every breeze, and their delicate tracery adorns alike the sequestered nook among the hills, the open forest, and the broad and undulating savanna.

Flowers grow with a luxuriance unusual in these latitudes. At the close of the rainy season the hills and forests are abloom with every variety of form and color, while in the gardens the rarer varieties are cultivated with a success that would make a New York florist gape with wonder. One lady in the little town of Arcata had eighty varieties of roses in her garden—not puny shrubs, but many of them large trees, with trunks as thick as the arm of a large and fleshy man. These were crowned with hundreds of flowers, in all stages of perfection and development. The beautiful "Géant du Bataille" was in very truth a giant. The tree—for it is folly to call it a bush—was fully fifteen feet high, and many of the flowers were as large as ordinary saucers. The tea roses—those most lovely and fragrant of all the rose tribe—were there in all their glory, with a daintiness of tint and exquisiteness of perfume that realized the fabled glories of the gardens of "Gul" and "Iarnistan." The climbers, too, were in unrivalled masses of beauty and bloom. Pinks and carnations, dahlias and lilies, hyacinths and tuberoses, with hundreds of others, lent their brilliance and perfume to adorn this most exquisite of gardens.

The graceful Fuchsia, the "ladies-ear-drop," here attains a luxuriance I never before even dreamed of. At Trinidad, some thirty miles north of Humboldt, on the brink of the mighty Pacific, I saw a vision of beauty that will remain with me forever. I had arrived at this deserted town during the night, after a hard ride and a hairbreadth escape from Indians, and slept in an old barn on the hill. In the morning I came out just as the sun was rising over the mountain back of the town. I had crossed this mountain in the darkness of the night. The deserted farmhouse at the foot of the hill on which I stood—a long, low building of one story—was covered, top, gable, and sides, with the scarlet fuchsia in full bloom. The dew had been heavy during the night, and the rays of the rising sun had just reached the house. Every dew drop sparkled in its beams like a diamond. It was an immense scarlet mantle bespangled with gems. Its magnificence was unequalled. I had seen many houses over which the fuchsia clambered in rich profusion, but never anything like this. It was grand. Ah, how magnificent the glorious handiwork of the great Creator! Who is like unto Him?

Speaking of the beautiful flowers recalls a rather annoying incident which occurred to your correspondent. My quarters at the post were in a one story house, with a frontage of some sixty or more feet, along which ran a veranda. During the dry season our parade became as brown as a berry. Being fond of flowers, and knowing what irrigation would do in that climate, I lined the entire front of the veranda with a row of boxes, which, through the kindness of some lady friends, I had been able to fill with roses, pinks, and many other varieties of flowering plants, and I had carefully tended them. They were in full bloom, and at once the envy and the delight of the ladies of the garrison, whose tables were decorated with many a fragrant bouquet from my charming *parterre*. Everything else on and around the parade wore its summer livery of brown. One morning I got up to find my cherished plants shorn close to the earth—not a stem or blade was left. Through the negligence of the sentinel, the gate at the entrance of the garden had been left open during the night, and a couple of cows entering soon discovered my treasures, and despoiled my garden of its beauties. Was it not atrocious? Those horrid cows! as our fair friends would say. Well, I tried again. Once more my plants put on their robes of lovely hue, and the delighted eyes of one and all were feasted with beauty, when again the same negligence produced a

similar result, and I gave up in disgust, sent away all my plants, and have not indulged in floriculture since.

But this is not "trout," and I started with the intention of telling about the trout fishing, but like an inveterate gossip have talked about everything save the real subject of this article.

If the salmon are abundant in their season, the streams absolutely swarm with trout the year round in uncounted multitudes. Every stream seems filled, and you cannot make a mistake. Throw your fly in any pool and you will "rise a trout." In travelling through the country, which I did a great deal during my frequent tours of inspection, as we camped every night near some brook or pool, and as I always carried hook and line in my pocket, even though we travelled in the lightest of "light marching order," with no superfluities whatever, by cutting a light rod from the bushes on the edge of the stream I was soon rigged out, and in a few minutes our larder was supplied. Fine, big, fat fellows they were, too, and so anxious to be caught. By the time camp was made and fire kindled, my fish were ready for the pan, and afforded no mean addition to our travelling fare. A half hour's fishing would supply fish for the whole detachment of fifteen or twenty men, and I often caught them of two or three pounds weight. The largest trout killed while I was in Humboldt was taken by Captain F. It measured twenty-seven inches in length, and the captain, who is learned in such matters, assured me it was a genuine *salmo fontinalis*. He was returning from his rancho one evening, and as he crossed a little stream about half a mile from his home stopped his horse to let him drink. As he did so a heavy swirl at the upper end of the pool attracted his attention. Early the next morning he strolled over to the brook, and at the first cast struck the fine fellow. After a brief struggle he became the spoil of the gallant captain, on whose hospitable board he shortly after smoked, crisp and brown, a most delicious morsel. I regret he did not ascertain its weight.

On one of my trips we encamped on the "Yuqua Rancho," a fine cattle range, but which had been deserted for years on account of Indian incursions. Our camp was beneath the spreading branches of a clump of large trees on the hill. At the bottom of the ravine a little brook fretted along, though then but a tiny rivulet, it being the dry season, with here and there a pool of some size. The detail sent to bring water reported to me a pool just alive with trout. So, though pretty thoroughly tired out, and not wishing to disappoint the men, for I knew what they meant, I clambered down the steep declivity. I found the pool to be about five yards in diameter, and apparently some six or eight feet deep, the water clear as crystal, and not a trout in the pool less than half a pound in weight. The little ones had all been eaten up. As to their number, the best idea one can give would be to take a gallon of huckleberries and empty them into a tub of water. The trout were about as thick as they would seem when stirred around briskly. I never saw anything like it. I cut a rod some six feet long, and with a short, stout line, sat on the edge of the pool, with my feet hanging over the bank, and literally "yanked" out forty or fifty in almost as many minutes. Many of them would have weighed over two pounds each. Having secured enough for our supper and breakfast—for we started before daybreak the next morning—I ceased fishing; but there was no perceptible diminution in their numbers. The Yuqua Rancho (pronounced I-u-quay) is also a most excellent hunting ground. Elk, deer, bear, and California lions are abundant; also, the numbers of quail and grouse are unlimited. It was then a famous, though a dangerous hunting ground.

A rather unusual case of voracity on the part of the trout was exemplified one day during one of our fishing excursions from the Post. We had ridden out to a little stream following through a mountain ravine, and one of the party came to me for a hook. At the same time he told me there was a trout in a hole under the roots of a tree near by—a pool left by the water—that had carried away his hook, and also that of another of the party. Hastening over I tried for the fellow, and soon had him out on the sand. He was not very heavy, say a pound and a half, but very active, and had fought hard. After taking my hook from his lips, there were left five other pieces of gut protruding from his mouth, to each of which was attached a hook, imbedded in his throat. Some of the gut lengths protruded fully six inches beyond his mouth. We dissected the fellow and extracted the hooks. My friend recognized and claimed his, as did the other. The remaining three came from where or whom we knew not. Evidently some one had been fishing there before us. How this trout, with these five hooks in his mouth, could have an appetite for mine, and take it, making the sixth, passes my powers of comprehension. A similar thing happened to me in Virginia a few years ago. I caught a fine black bass, or, as they call them there, a "King William" (not Kaiser Wilhelm; he would not be caught) in the river Dan one bright afternoon, and a friend who was with me recognized the hook and piece of line protruding from its mouth as his own. The bass had broken his line that morning—*mais, reverons a nos moutons*.

On another occasion, in the same stream, one of the party told me of a fine pool below, where there were three or four tremendous trout, which would take neither bait nor fly. Thinking he had been incautious, and let them see him—for these big fellows are wary, although trout were so plenty and so tame, shall I say, that usually it made little difference how incautious one ordinarily was—yet I always found the "choice specimens" wary and shy. So I went down the stream with my friend for about a mile, and carefully approaching a large pool of perfectly transparent water, peeped through the bushes, and there, far down in its glassy depths, were some magnificent fellows. The smallest could not have weighed less than three pounds. They had the pool to themselves; a little chap would have had no chance there. Light as a feather, my fly drifted down on the gentle breeze drawing through the ravine, alighting on the water as delicately as a tired moth. But the trout would not look at it. Seeing they seemed to be aldermanic looking, full fed fellows, I thought I would try my friend Prime's plan, and appeal to their grosser natures. So I slipped a piece of worm on the bend of the hook, and letting it drop as if from one of the overhanging branches, it gradually sank in the clear water. A monstrous fellow paddled lazily up, seemingly bumped his nose against it, and then, contemptuously turning tail, as lazily sculled away. I felt disappointed, and determined to have that trout if it took me a week to circumvent him. Sitting down at a little distance from the pool, and lighting my pipe—the "supreme solace" of the Arabs—I racked my

brain for some device by which to overreach or seduce the fellow. A bright idea struck me suddenly. Thinks I to myself, the fellow is disgusted at my parsimony; why did I not present him a dish that would satisfy a lordly, obese old fellow like him? Why tantalize him with a morsel delicate and dainty enough, certainly, but only fit for some simpering young lady trout? So I acted on it. Going to my friend, who also was enjoying his "*opium cum digitalis*" (Latin idiom for "pipe"), and reflecting gravely, I again borrowed his bait box. From this I selected a large, fat, active worm about six inches in length. Quietly stealing to the edge of the stream above the pool, I let my line gradually float down with the current until the bait was swept into the pool. A moment of breathless suspense, then a fierce tug, and behold! Mr. Alderman had been captivated. I had him. He could not resist the green turtle soup (fat worm crawling over the bottom of the pool) so lavishly set before him. I will not weary you with details of the contest. In short, some fifteen minutes later the gentleman paraded his glistening sides upon the bank, a wiser and a sadder trout. He weighed nearly four pounds. After another pipe, I thought I would try again, but his friends were too wary, and would not be persuaded; so contenting myself with my single prize, as the evening was growing apace, I left for home. We had "the alderman" for supper. Some weeks later I made a special visit to this pool, arriving just at dusk. I used a large white moth, and before I left the pool was tenantless. I caught but five, but they were "whales." They weighed from two and three quarters to four and one half pounds each.

I afterwards killed a five pound grilse in a pool of the same stream, two or three miles farther up. He was landlocked, caught by the fall of the water, like my friend "the big trout," in the last number. There was nothing remarkable about his capture, for I saw him before he struck my fly, and knew what I had to deal with.

In all such cases the fish has not a fair chance, but it is, notwithstanding, grand sport to get a fine fellow on a seven or nine ounce rod, with delicate tackle. And yet it seems rather inhuman, too, for the invariable verdict is, "worried to death." If the fish had a fair chance, to kill him would be a feat worthy of our venerable father Izaak. But to catch him penned up in a small pool, and have him rush frantically from side to side, like a wild bird beating its life out against its prison bars, until, wearied out, he gives up, and yields himself (he is not captured) to his vanquisher, although very exciting and fascinating at the time, yet it always leaves a tinge of regret. But after all, I must frankly say that, like the tippler who, on being told it was a sin to drink, replied that he had always heard that sin was very fascinating, and that if drinking whiskey was a sin he liked to sin whenever he had a chance. So I like to catch salmon, even at such a disadvantage, and console myself and ease my conscience with the thought that perhaps the fineness of the tackle almost or quite counterbalances the odds.

But I will cease, for fear lest some of your readers should accuse me of "romance," though there are many more "yarns" of this kind in my budget. But what lover of the gentle craft has not hosts of such reminiscences? Nor shall I discuss the point as to whether the trout of the Pacific slope is the same, or a different variety from its eastern brother. I have caught them both, with and without the red spots, and both light and dark in color, and always attributed these differences to the peculiarities of their habitat. They take both bait and fly readily, but brighter flies than those used east are the most killing. The red ibis, in these dark glens, was sure for a three pounder, if there was one in the pool.

One of your correspondents speaks of the trout of California as being dull and heavy, and not to be compared with those of Maine for pluck and endurance. The salmon ditto. With all due respect for the "amor patriæ" of the New Englander, I must differ with him. He certainly never fished in the Humboldt Bay country. If he will try the icy mountain streams and lakes of northern California and southern Oregon—*foi de chevalier*—he will have no lack of vigor on the part of the trout to complain of, and will need all his science. That he may have the opportunity of testing it is all the harm I will wish him.

MONMOUTH.

For Forest and Stream.

TROUTING IN NOVA SCOTIA.

[Two weeks ago we alluded briefly to a recent trip made by some gentlemen to Yarmouth, Nova Scotia, in which they did some "tall" trout fishing. Herewith we give a full account of the trip by one of their number. We notice that we erred in stating that the steamer Linda sailed on Thursdays; we should have said *Tuesdays*.—ED.]

ON the 12th of May I started on my annual trouting trip to the "Bluenose country." My friend G. was again with me; friend L., from Vermont, accompanied us, making his first trip. The route is by the sea-going steamer Linda, leaving Boston every Tuesday at twelve o'clock noon, or to St. John by boat or cars, and taking the same steamer Linda on Friday night at six o'clock. The steamer has good accommodations for about fifty passengers, and is an excellent sea boat, commanded at present by her owner, Capt. Clements.

The destination is Yarmouth, a cozy little town on the bay side of the Cape, and is only 240 miles from Boston; somewhat nearer than St. John, N. B. The population of the town is about 5,000, which is one of the nicest and most comfortable towns for early summer visitors that I know of—no hot broiling days, nor cold, damp nights, but a quite even temperature. The inhabitants are social and hospitable to visitors and strangers. I predict that should pleasure seekers but once turn their course that way it would soon become a very popular resort. After one has looked the town through, and made some very pleasant acquaintances, many of whom will give you proper directions, you can select your route (mine was determined before leaving Boston)—one route up the bay coast, as far as Digby, with numerous salmon and trout streams, the other the Tusket, with its three branches, all of which are good.

By consulting the county map, you will observe that Yarmouth county is nearly one fourth water; every lake and river contain in their season salmon and trout. The land lies comparatively level, and on the borders of the rivers are many acres of meadow, overflowed by high water. The Tusket, with its branches, feed and supply the lakes. The best fishing is in the rapid portions of the rivers, between the lakes, and in the large pools at the foot

of the rapids. After selecting the route, and if you are to camp out, purchase all your stores at Yarmouth, and depend upon your boatman up river to furnish all the cooking utensils, and to make camp and do the cooking. Boating is indispensable if you desire the best sport. May and June are the best months for trout; June and July for salmon. Boatmen are in demand during the month of May, on account of the "run of herring," called there *gaspereaux*, which are taken in great numbers, and constitute one of the principal articles of food for the inhabitants. The main river is good fishing if at sufficiently "low pitch," and holds out for late fishing, and the only portion where one might expect to kill salmon. The western branch affords nice sport; the trout, however, are of a smaller size, generally from two to four to the pound, with an occasional "pounder." In a large pool above John Ranard's mill, at the foot of the rapids, salmon might be taken if one was not too early in the season. I choose the southeastern if it is free from anglers. The trout are of a larger size, and one is sure of getting a boat at the Forks by writing a week beforehand to Capt. S. Gardiner, or to Cyrille Doucette (the only place to put up at the forks), for either the southeastern or the main river, up or down. The boatmen you cannot rely upon to point out the choice spots in the falls or pools. They are no anglers. You must exercise your own best judgment. They will put the boat where you wish, and are quite expert in holding it in the rapids with a single pole.

I found it greatly to my advantage to take a small rope seventy-five yards long to anchor the boat at the head of the falls, and fish slowly down, letting out the rope as occasion demanded. By this system one can carefully fish over the whole territory, and greatly relieve his boatman. The larger fish we found at the head of the falls and at the head of the pools. The falls, with two or three exceptions, can be passed in the boat by hard poleing by the boatman, with your assistance.

Robert, one of our boatmen, was constantly getting wet or drinking hot tea, either of which would bring a sudden rise of his right leg, a French yell, and a close gripping of his jaw—sure symptoms of a jumping toothache. We administered (free of charge) cayenne pepper, salt and alum, pulverized, tar and oil, Parr's liniment, and kilex—the three last being black fly poison—in regular order, but the thing wouldn't let up on Robert, so he promised himself faithfully that if God spared his life another week he would walk to Tusket, fifteen miles from the forks, and "upturn some of them roots." I told him the story of the tooth carpenter in the Adirondacks, related in the FOREST AND STREAM of April 9th, when a happy thought struck him that old Lapstone, the cobbler, might give him "ease and comfort." So as soon as we landed at the forks, the boat unloaded and hauled out, Robert was missing, and nothing was heard from him until the morning, when he appeared very cheery on the right side, and with a bandage over his head. Upon inquiry after the offending molar, he said, "he stop dat ache last night, but had a wusser one now." Said "he thought if a city chap could stand a pair of Adirondack bullet moulds, he, an Acadian, would not flinch at a pair of cobbler's pincers." So he went to Lappy's shanty and made known his trouble, when Lappy sat him on the floor between his legs, back to him, and putting his left hand on Robert's head, and his right knee against his cheek, to serve as a chock (fulcrum I think he meant), he then applied the shoe pincers, braced up all around, then yanked and twisted, "and something come, I tell ye."

"Well, Robert, did he get the tooth?"

"No, not 'zactly, but he got all the ache, and more than half the tooth."

I recommended a charge of powder to complete the job.

The inland fishery laws are generally well observed, or have been for the past three years, and the people now see and receive the benefits. During the month of May the herring run up the rivers to spawn; the salmon May, June, and July. There is no legal obstruction to any river. Weirs, traps, and nets are to be set *only on sides* of rivers, and at considerable distance from the falls. On Friday night, and until Monday night, every fishing device must be removed, and dipping suspended, giving the fish uninterrupted course and right to their spawning grounds.

Muskats are very abundant. One is hardly out of sight of them in still water. Beaver signs were plenty in the neighborhood of Gull Lake and the English Mill. I saw two houses, and took several sticks of freshly cut poplar from them. Partridges and ducks are very numerous. Moose signs were fresh and plenty at Gull Lake.

We had such excellent trouting on the southeastern that my friend L. went back on the return trip of the Linda, having but one day's sport. He however has promised to take another trip the coming season, and take the "wimmin folks" along and stay a month.

The next day my friend Mack, of Yarmouth, who accompanied us on the trip, returned home, taking a nice lot, among them many two pounders, which were exhibited in the hotel there a short time, and our credit (angling) fully established. This display brought up to us Rev. Mr. Campbell and Capt. H., at night, and a very pleasant evening was spent relating fishing stories and passing free jokes upon the cloth. Next day the parson and the captain went up lake Mispah, and were completely drenched by the frequent showers; yet they enjoyed it to the fullest extent, and apparently with great satisfaction. The parson was very near sighted; so much so that he could not always see his fly. His "best hold" seemed to be when the trout was fast. They returned home with a basket well filled.

We caught somewhat over 500 during our stay of a week, which were as many as we could eat, supply the family table, give to our immediate friends, and take home. The flies mostly used were, this year, the large Montreal, and a small salmon* fly with blue jay wings: last year, in addition, the yellow fly; the larger the fly the better.

After the herring spawn they return to the sea, the young following late in the fall, which are followed down river by a hungry shoal of silver eels. The inhabitants make calculations to secure one barrel of herrings, salted, and one barrel of silver eels, salted, for each member of the family, which, with what potatoes they raise, give them an air of independence. Asking Robert which of the two was best he said:—"When you eat *gaspereaux* you don't eat much, but when you eat silver eels you have something."

Salmon fishing is free in all the rivers in the county. Taking everything into consideration, I prefer Yarmouth county for trouting to any place I know of, and shall try it yearly.

*In the paragraph referred to in top note as being printed two weeks, since, we printed *Salem* fly.—ED.

For Forest and Stream.

HAIL TO THE ADIRONDACKS!

"Give me mine angle, we'll to the river, there
My music playing far off, I will betray
Tawney-finned fishes; my bended hook shall pierce
Their slimy jaws; and, as I draw them up
I'll think them every one an Antony,
And say: Ah! ha! you're caught."

ANTONY AND CLEOPATRA.

ABOUT two years ago a party of us were rowing up the Beaver River in the Adirondacks, guided by that well-known and remarkable guide, Edwards. I can say for this sun-burned, sinewy man that he can paddle up to the wildest buck, glide alongside the liveliest spring-hole, turn the best-browned griddle cakes and make the best broiling iron of a spruce slab of all the Kit Carsons of the North Woods. Born and bred within hearing of the wild notes of this vast wilderness he was as much at home among its tangled trails as your New Yorker is on Broadway. Edwards and I were on good terms from the start, and to me he confided many secrets of the region. Get the ill will of your guide and you may as well return home, as far as the prospects of fine sport is concerned, but there is a sunny side to his rough but honest heart if you only find it. After several days of very fair fishing in Albany and Smith's Lakes, it was suggested by the party that perhaps Edwards could take them to some less-frequented spot, though we were now some seventy miles in the wilderness. Edwards didn't appear to fall in with the idea at once, but after a time acknowledged that he did know of a pond where he thought we could get some fish. It was a long carry, over a high mountain, the trail was blind and rough, with fallen trees every few rods; when we should get there it might be too cold, but if the weather looked right—and it didn't exactly—and one or two of the party wanted to take the tramp, why he would lead the way. Most of our party thought dubiously of the proposition, and it was finally agreed that one other and myself should on the morrow make the voyage of discovery. So, fitting out as lightly as possible, we were off with the first faint signs of the morning.

Who can describe the Adirondack mornings? Who can paint the mist, rising like a veil from the bright blue eyes of beauty, or the first golden gleams of the new-born sun upon the surrounding mountains?

"The grey-eyed morn smiles on the frowning night,
Checking the eastern clouds with streaks of light;
And flecked darkness like a drunkard reels
From forth day's path-way made by Titan's wheels,
Now ere the sun advance his burning eye,
The day to cheer, and night's dark dew to dry,
"Night's candles are burned out, and jocund day
Stands tip-toe on the misty mountain's top."

A fine buck was nibbling and drinking alternately by the shore where we were to land and make our first carry, and Edwards paddled us very close to him before he "raised his flag" and bounded away. We arrived at our destination about noon—a wild pond two miles in length set in the unbroken forest like a jewel. We resolved to have trout for dinner, and were soon trolling along the shore, the guide silently paddling his boat, it being too early for fly-fishing. The first trout was taken by my friend at the mouth of a brook, where the guide rested the boat, and we tossed about with lines reeled in somewhat—weight about one pound. We rowed some distance after this without striking a fish. By and by Edwards saw a deer; yes, two of them. Where were they? We searched the lake shores in vain with our eyes. But soon we could distinguish a little motion among the rocks and stumps, and after a time we could plainly see the deer feeding quietly along the shore. Just ahead of us large rocks reared their heads above the water, and near by lily pads were just beginning to appear. I secured a fine trout here, and he was no sooner in the basket than my friend's line was sawing the water and his rod springing beautifully. I tossed my line near the lily pads and was soon at work with a lively fellow who was bent on putting distance between himself and trouble. My friend's eyes fairly gleamed with delight, and his face was as bright as a new-blown morning glory as he found himself playing a large fish on one side of the boat and I at the same time doing likewise on the opposite side, as was very often the case. The guide seemed to enjoy it as much as anyone, and managed the boat to perfection. We had now a fine basket of fish, none smaller than three-fourths of a pound, when suddenly the sport ceased. We placed tempting morsels in quiet retreats, but all in vain, and the guide moved on around the rocks. After a few throws I had an ordinary strike, as far as I could judge at first, but in an instant I saw that I had hooked "an old resident." The manner in which he left the region of rocks was worthy of a lake pilot. He stood not on the order of his going, but went. My reel fairly hummed as I called to Edwards to follow quietly with the boat, so as to ease matters when I should come to the end of my line. I seldom use any other than a light Judson fly rod, and I believe I have never lost any fish for that reason alone, but as the last few feet of my line reeled off and I began to slacken the headlong career of my trout, I almost wished I held more timber in my hands. But the spring of my rod aided me in turning his course and soon I was reeling him in. After several frantic dashes the trout came in on his side, and without allowing his motion to cease, I drew him into the boat, a full three pounder, and one of the most magnificent looking fishes I have ever seen. In ten minutes from that time he was broiling on a spruce slab, his flesh as yellow as gold.

No one enjoys his dinner more than your hungry fisherman as he spreads his limbs upon the mossy carpet of the forest and rests his back against some old tamarack that has been beaten by the storms of centuries. Even now the smoke of his after-dinner cigar and the remembrance of his after-dinner story occupy a hazy position in my reveries. Eatables running in his mind, hotel stories escape therefrom. Thus the old story of the traveler in the time of our grandfathers, who, as night came on, demanded hospitality of a way-side inn. How he was provided in his knapsack with sufficient nutriment for his evening and morning meal, but of a lodging place he was needy and was amply provided for by the host. How at rise of morn he demanded to be shown his bill, which the host duly presented with satisfaction beaming in his honest face, the sum total of the same being six cents. How this the traveler paid with liberal hand and remarked, as it was then the custom that the host should stand treat, "that he would take brandy." How the traveler was compelled to acknowledge his inability to carry away inside safely all that the host had poured out

for him and the host presented him with a bottle in which to place the remainder, thus providing refreshment for his weary march. And how at the earnest request of the honest host the traveler consented to patronize the same hotel should he ever visit that part of the country again. Alas, the days of the honest host are no more!

It is always laughable to hear fishermen tell of the largest fish which they invariably lose; yet, it is not at all strange that they should often lose these fish. If I were to give a report of my fishing, I should be obliged to be not at all original in this respect. Thus on this day, after fully resting, we again set out and my friend, after securing a trout as large as my best, lost a most noble fish after a short tussle. When one has a very large fish at the end of his line he is not apt to be as composed as formerly. And still later as we were rowing along the shore with about eighty feet of my line out, not expecting a strike, and partly reclining in the bow of the boat, a despatch was conveyed to me through my rod that business required my attention. My rod doubled up like a spear of ripe timothy grass in a gale, and eighty feet behind us a big trout shot his full length out of the water, coming down in a way to make the foam fly. It was worth the expense of my trip to see that leap. Of course it was not intentional with the trout, but as he made a dart for the hook the motion of the boat partly forced him out. If Edwards had not instantly stopped the boat I should have nothing further to relate of this fish; but as it was I felt a slight yielding when the trout started off on a side line, and when headed there pointed for the opposite direction and then kindly consented to come and take a look at us; but not being pleased with the sight he struck a bee line for the most distant part of the lake at a rate of speed that would shame Dexter and which left me with little hopes that my line would stand the strain. When sixty feet of line had spun out I pressed the reel slightly at first and stopped him, but he struggled so frantically that I was obliged to let him go again, and the guide paddled the boat after him for some time, the fish taking the undignified position of a canal horse and we that of passengers or freight. When headed again the trout paid us another visit, when we could see the great fellow as plainly as though he was in the boat, but not seeming desirous of closer acquaintance he made way again with as great force as before. These maneuvers being continued for some time till the perspiration rolled off my face and my arms became quite tired, we made the attempt to raise him into the boat, despairing of ever drowning or tiring him. But this proved unsuccessful, as we had no landing net. After many vain and despairing efforts he finally broke loose and escaped, and I lay back with hardly strength enough to raise my rod.

We had in the afternoon taken nearly as many large fish as before dinner and were now satisfied to turn our prow towards camp to smoke, to sleep, perchance to dream.

C. A. GREEN.

Rochester, N. Y., May 25, 1874.

The Horse and the Course.

—The American Jockey Club held the first day of the summer meeting on the beautiful and excellently well-managed course at Jerome Park, Fordham, N. Y., on Saturday, June 6th. The drive through Central Park presented a charming scene as the four-in-hand drags, tandems, T. carts, and private equipages, swept by in one continuous file with the *élite* of the youth and beauty of the city to add to the gay pageant, which reminded one of the cup day at Goodwood. At the club house were about 800 members and their lady friends, and the grand stand and inclosure were largely occupied with spectators to witness the capital racing of the day. The track was a trifle heavy, which eventually told on all the favorites. The weather was insufferably sultry, but the showers in the early morning had laid the dust, which made it pleasant for driving. The first race was a dash of three-quarters of a mile for a purse of \$500, with allowances to maidens, according to age. Eleven horses started after several attempts; the Wizard having the best of the start, lead nearly all the distance, until they came to the lower turn, when Free Lance took the first position, but the jockey of Wizard calling on him and giving the whip landed him a winner by two full lengths. Free Lance second, Kadi third. Time—1:21. The Fordham Handicap Sweepstakes of \$50 each, half forfeit, and only \$10 if declared by the 20th May, with \$500 added, the second horse to receive \$200 out of the stakes, was the second race. Distance, one mile and a quarter. Nine horses were marched in Indian file to the three-quarter pole, and after one or two false starts, they got away pretty evenly, Survivor leading, followed closely by Artist, the favorite Mate being third. On turning the bluff, and on going out of sight, Survivor still lead. Coming in sight again Artist lead, Survivor second and Mate third. Now came the struggle for victory, which terminated in Survivor winning the race by a neck, Artist second, Mate third. Time—1:50. The Withers stakes was the third race, for three-year-olds of \$100 each, half forfeit, with \$1,000 added. Distance, one mile. Fourteen horses started after a delay of three-quarters of an hour, which was no fault of the starter, as when he did send them off they left the post together; Josie B. got away first, Persuader second, Reform third, Beatrice fourth, and the rest close together. Dublin and Culpepper caromed, both going down throwing their riders, Donohue and Palmer. Donohue had to be lifted out of the saddle and handed over to a physician, young Ponton taking his place. Neither of the colts was hurt. Dublin won by two lengths, Vandalite second, and Reform third. Time, 1:50. The Westchester cup was the fourth and last race, a sweepstake of \$50 each with \$1500 added. Distance, two miles and a quarter. The start was even, Blacksmith on the lead, Wanderer next, Abdel Koree third. The race was at evens, Lizzie Lucas on the lead for a time having passed both Blacksmith and Wanderer. Rounding the lower turn Shylock was forging ahead with rapid strides, and soon showed in front. Lucas stuck well

at her work, but the son of Lexington showed her his heels and won the race by four lengths in 4:13, with Lizzie Lucas second, Village Blacksmith third.

Saturday, June 13th, will be the third day of the Jerome Park races, when the Belmont stakes, the Juvenile stakes and a purse of \$600 will be run for.

—St. Denis is a beautiful thoroughbred horse, owned by Captain Hodges, of Kalamazoo, Mich., and has taken two gold medals, one for the best stallion of forty-three entries and one for thoroughbred stock. He is a bay, sixteen hands, was bred at the Woodburn Stud Farm, Kentucky, and is purely thoroughbred.

—The English Derby race took place, as usual, on Epsom Downs, on January 3d, which is about seventeen miles from the metropolis of England. The race is run for by three-year-old colts and fillies; colts carrying 122 pounds; fillies, 119 pounds. Distance, about one mile and a half. This race, like most all of the races in England, is run on the natural turf. The favorites were all beaten by W. S. Cartright's George Frederick, Couronne de Fer second, and Atlantic third. The next important event at this meeting is called "The Oaks," which is run for by fillies only, carrying 122 pounds. Distance, about one mile and a half. Mr. Laundo's Apology won, Miss Tolo second and Lady Patricia third. The incidents and details of both the above races we trust to publish on receiving copy from our special correspondent, "Idstone, Jr.," in London. "Prospero," the turf oracle in *Land and Water*, was, we believe, the only writer that came out boldly, predicted and printed the name of the winner of the Derby at least a week before the race took place.

—A harness kept soft and pliable with good neats' foot oil will last almost a life-time. It is stronger, because slightly elastic, and will seldom wear off the hair.

OBITUARY.—Major John Powell, for many years military editor of the *Army and Navy Journal*, died a few days ago in his thirty-first year. He was one of the incorporators of the National Rifle Association, and held the office of Treasurer in that organization for a considerable length of time. He was also an honorary member of Company C, Thirteenth Regiment, Brooklyn.

Major Powell was attached to the staff of FOREST AND STREAM for several months, and furnished the military news for this journal until we discontinued that department. His death was unexpected and a painful surprise to his numerous friends.

—We are glad to learn that Robert Bell, Esq., C. E. F. G. S., is a candidate for the chair of Natural History in the University College of Toronto. Mr. Bell's acquaintance not only theoretically but practically with the geology of Canada, and with her birds, beasts and fishes, must make him especially qualified for the position. Mr. Bell's works on the Mollusca and birds of the Lake Superior region, and the accounts of his explorations in the Nepigon and Saskatchewan regions, show him to be not only a gentleman capable of imparting information, but places him as among the leading Canadian explorers.

THE STATE SPORTSMEN'S CONVENTION.—The Leatherstocking Club have voted to hold the Annual State Shoot during the week commencing June 22d. The programme will be published in our next issue.]

—The "New York Association for the Preservation of Game and Fish," will meet at the Doolittle House, Oswego, on Monday, June 22d, at 8 o'clock P. M.

ANOTHER TESTIMONIAL.—With our usual modesty, having little regard to the pomp and vanity of this world, we print the following letter from an old friend, whose opinion we regard as worth having. It will be seen by the date that we have withheld the letter some six months. Meanwhile we have complied with the only conditions which the Doctor regarded as necessary to make our journal perfect in its component parts, namely—to partly illustrate it.

LAKE CITY, Minn., —22, 1873.

EDITOR FOREST AND STREAM:—

For nearly twenty years I have both talked and wrote in favor of a sportsmen's paper precisely of the character of the FOREST AND STREAM. A few years ago I wrote to some of the prominent publishers of New York, recommending the publication of such a journal, stating, among other things, that the natural history of the various game birds and animals should, in my opinion, be one characteristic of the paper. I also consulted and corresponded with many intelligent sportsmen upon the subject. While all desired such a paper, two objections were universal. First, it would not pay; second, sportsmen would not write for the paper sufficient to make it interesting. Neither of these objections seemed valid to me. I believe that a great circulation can be obtained for such a paper, and it consequently made to pay. Again, I think the number of correspondents in your paper thus far proves the fallacy of the second objection. I think a little encouragement and a little urging will induce sportsmen to write out their thoughts and experiences, so that there will never be any want of contributors. All over our land we have sportsmen who are reckoned among the very best educated men in the country. Among them are many naturalists, so that this department of the paper may always be well filled. I think, without a doubt, that very soon your paper will be able to show a list of contributors second to no other periodical. Now that sportsmen have a proper and able representative let them sustain it. Let a united effort be made at once in every part of the land to obtain subscriptions, so that the paper may be put beyond the possibility of a failure.

DR. D. C. ESTES

—Fan and sunshade combinations (for riding) are of black or white silk and lace with jeweled handles.

—White corduroy jackets for riding are made double breasted and trimmed with wide black velvet.

—The most fashionable bathing suits are of navy blue flannel.

—For the sea side white alpaca trimmed with black velvet is a servicable dress as it is not affected by salt air.—*Danbury News*.

—A foolish lady sent a bride a *white satin pen wiper* as a gift.

BIRDS BY MY WINDOW.

A JUNE SONG.

SWEET birds that by my window sing,
Or sail around on careless wing,
Beseech ye, lend your carolling,
While I salute my darling.

She's far from me, away, away,
Across the hills, beyond the bay,
But still my heart goes night and day
To meet and greet my darling.

Brown wren, from out whose swelling throat
Unstinted joys of music float,
Come lend to me thine own June note,
To warble to my darling.

Sweet dove, thy tender, love-lorn coo
Melts pensively the orchard through;
Grant me thy gentle voice to woo,
And I shall win my darling.

Lark, ever leal to dawn of day,
Pause ere thou wing'st thy skyward way—
Pause, and bestow one quivering lay,
One anthem for my darling.

Ab, mocker, rich as leafy June,
Thou'lt grant, I know, one little boon,
One strain of thy most matchless tune,
To solace my own darling.

Bright choir, your peerless song shall stir
The rapturous chords of love in her;
But who shall be our messenger,
When we salute my darling?

Oh, voiceless swallow, crown of spring,
Lend us awhile thy swift curved wing;
Straight as an arrow thou shalt bring
This greeting to my darling.

EDWARD SPENCE.

—Galaxy.

Fish Culture.

This Journal is the Official Organ of the Fish Culturists' Association.

WAIL OF A FISH CULTURIST.

Doubtless the task of a Fish Culturist in giving instruction to inquisitive or sincere seekers after information, is as thankless as that of some editors. (No special reference to ourselves, we are proud to say.) Some people expect a man to butter his daily bread with his brains and then give it away free of charge, and are surprised if any pay is demanded. We can appreciate and respect the state of mind that induced our correspondent to utter the following plaint:

HONEYE FALLS, N. Y., May 21, 1874.

EDITOR FOREST AND STREAM:—

The patient, long-suffering, over-bored fish culturists have at last struck. I have at least twenty letters a week, each of which, to do justice to, would take an hour to answer carefully, and not one "stamp" in them all! Now, I don't mind it from customers, but from people of whom I have never heard it is asking too much. They must think we do business for fun. They should understand that the knowledge they require has been gained by us at an almost ruinous expense of both time and money. One man in ten sends a stamp, and one man once sent a dollar and another fifty cents. I set it down to thoughtlessness, and have kept on writing, but it is not right, and I must seek relief somewhere. I honestly think I do more work for less or no pay than any other man in the country.

Can't you drop a line, a plea, or something, or organize a society for the relief of the down-trodden and over-worked FISH CULTURIST.

THE GROWTH OF SHAD.

In our issue of May 21st we replied to the queries of M. Blakeslee, of Olean, N. Y., respecting the growth of shad from year to year, giving as we supposed a correct version of a letter which we solicited from Seth Green, from whom we sought information. Mr. Norris, of Philadelphia, first called our attention to a palpable error in our statement as printed, and we wrote again to Mr. Green for a revision, and received the following courteous note:

ROCHESTER, May 19th.

Dear Sir: I find plenty of yearling shad in the Hudson river in June, and a good many two years old—males. The two-year old ones are nearly all male shad, and if they do go to sea the first year, they may drop down to the mouth of the river, and perhaps go a short distance in the bay. I have learned what I could for the chance I have had without going in and swimming down with them, which I do not intend to do if it is never found out. I am satisfied if they come back in great numbers when they are full grown. I think my old friend Norris is right about the Alleghany shad. I have made the same remark. It is an experiment, and no one knows what the result will be. I am prepared for anything. No one will know until the third or fourth year.

Yours, SETH GREEN.

—The California aquarium car left Charlestown, N. H., Thursday, June 4, at 2 P. M., to arrive at Albany at 11.10 P. M.; Rochester, N. Y., Friday, June 5th, at 1.15.; Detroit, Friday, June 5th, at 10.30 P. M.; Chicago, Saturday, June 6, at 8.30 A. M.; Omaha, Neb., by way of Chicago and Northwestern railroad, Sunday, June 7, at 10 A. M.; Cheyenne, Wyoming Monday, June 8, at 1.35 P. M.; Ogden, Utah, Tuesday, June 9, at 6.15 P. M.; Carlin, Nevada, Wednesday, June 10, at 10.20 A. M.; Truckee, Cal., Thursday, June 11, at 4.50 A. M.; Sacramento, Cal., Thursday, June 11, at 1.20 P. M.; San Francisco, Cal., Thursday, June 11, at 8.05 P. M.

The aquarium car is a large passenger-baggage car, forty feet long by nine wide, with twelve wheels, an air brake and a Miller platform. At one end of the car is a station-

ary fresh-water tank holding five tons of water, and at the other end, two salt-water tanks, holding in the aggregate the same amount of salt-water. The ice boxes are over the tanks, and there are upward of twenty portable tanks between these two. In the top of the car is an aerating machine for forcing air into the water in the tanks and cans. This is an ingenious contrivance and works finely, supplying the fish with all the air they need. It was stated that not a fish had died since the car started on its long journey. The following are the varieties of fish in the various receptacles: Lobsters and oysters from Massachusetts bay; tautogs, eels, and weak-fish from Martha's Vineyard; striped bass, black bass and wall-eyed pike from Lake Champlain, Michigan and Nebraska; horn pouts from Lake Champlain; fresh-water eels and shad from the Hudson River; cat fish from Raritan River, N. J., alewives from Mystic River, Mass. The fish are to be placed in the waters of California.

—The Massachusetts State Fish Commissioners have begun stocking Westfield River with migratory fish, and on Thursday, 2d inst., emptied 50,000 young salmon into the river on each side of Westfield.

—The Connecticut Fish Commissioners have agreed to build a fishway over the Greenville dam, this summer, and put 100,000 shad in the Quinnaug River at Putnam, about the middle of July.

CALEDONIA, June 4, 1874.

EDITOR FOREST AND STREAM:—

Dear Sir: I have hatched all but one of the grayling eggs which Seth Green brought from Michigan in water averaging 46 feet, the time of incubation is about ten days; the sac lasts about six days. When first hatched they lie on the bottom like young trout, but commence to swim on the third or fourth day.

May 5.—Eggs arrived from Michigan.

" 8.—First egg hatched.

" 11.—All eggs hatched out; one lost.

" 12.—First fish began to rise and eat.

" 15.—All swimming.

At the present date they are all doing well, and I have only lost two of the fry. The eggs are nearly as large as trout eggs, but of less specific gravity. The fry resemble the young of the whitefish.

You have said two or three times in your paper that the grayling were undoubtedly the "coming fish." I would like to have you give your reasons for the faith that is in you.

Yours truly,

A. S. COLLINS.

[See FOREST AND STREAM June 4th for "reasons of the faith."—ED.]

—The experiment of inducing the return of herrings annually to Town Brook, Plymouth, Mass., as they used to do, many years since, in great numbers, has been entirely successful. To bring this about it has been merely necessary to introduce a limited number of the fish into Billington Sea in the spawning season, and the result this year is a visitation that proves the instincts of these scaly specimens may be relied upon, no matter what obstructions are placed in their path. At the mouth of Town Brook, and for some distance of its course into the harbor, the water literally swarms with fish, all desperately bent upon getting up stream; and Ropewalk Pond is also filled with them, as they are continually ascending by the only fishway which has been constructed.

This information is most valuable, and no doubt the same method may be adopted with equal advantage to other waters, now deserted, which once swarmed with salmon, herring, or shad.

FARMING THE WATER.—Mr. George Jerome, one of the Fish Commissioners of Michigan, communicated to the *National Granger* the following data in relation to the value of fish-breeding as one of the industries connected with Agriculture:—

When the sea, the lake, and those unnumbered rivers and streams that bear their never ceasing flood seaward, shall make such returns as they are capable of making, the immense increase in cheap, abundant food will tend greatly to harmonize the relations of capital and labor. It is estimated that the yearly catch, consumption and value of fish in these countries alone is equal to \$120,000,000. Now suppose we put the fish at three cents per pound, and it will give up 4,000,000,000 pounds of food. Suppose that we estimate the weight of neat cattle at 700 pounds each, and a pound of fish to be equal to a pound of meat and we have here as much food, all the uncultivated yield of the sea, as is equal to 5,750,000 of cattle.

Now to this add yield of the whole sea, the lake, the river, the lakelet, and we have an amount of good brain, bone and muscle food almost beyond the range of calculation. If we except China, Japan and a small part of Europe, not a tithe of our great water-farm has yet been subjected to cultivation. Let it be cleared up, plowed, manured, so to speak, scientifically tilled, and the choicer varieties of stock introduced, and we will prove a given acreage of water to be equal in production and value to the same acreage of land.

STOCKING STREAMS WITH TROUT.—A Wisconsin farmer writes to the *Western Farmer* as follows, and makes a suggestion we think worth heeding:—A year ago, having more young trout than my pond would accommodate, I put a few thousand into a barren stream near me. They were then about one inch long. A few days since I thought I would see what they had done. I took my rod and a couple of my little boys and went to the branch, and in less than an hour caught thirty, all we wanted, and might have caught hundreds, as we could see them in schools of fifty or a hundred in a place, for a mile up and down the brook. They were about seven inches long, and those left by midsummer will be nine or ten inches long, or what would be called a nice catch.

As this same thing can be done by every brook of pure water, (either hard or soft), in the State, I submit if it would not pay the owners of brooks to stock them, if in nothing else, in furnishing one more attraction for the farm. If not for themselves, for the boys, for recreation is as ne-

cessary to them as meat and bread, and if they can't find it on the farm they will hunt it in the village.

YOUNG SALMON.—The boys at the Salmon Falls and Upper Mills, Maine, are catching large numbers of small salmon from four to eight inches long. These must be a portion of the "ten thousand" placed by Commissioner Stillwell in the upper waters of the St. Croix last year, and which have journeyed thus far on their way to the ocean.—*Bangor Democrat*.

—Mr. Martin Metcalf, of Baltic Creek, Michigan, is engaged in the experiment of raising grayling in his lake, or rather in the stream leading from springs into the lake. The fish are thriving, and promise complete success.

Natural History.

"DO QUAIL WITHHOLD THEIR SCENT."—It appears that the late discussion in FOREST AND STREAM, of the question "Do quail withhold their scent?" has attracted considerable attention on the other side of the Atlantic. Mr. Laverack writes us and says: "Your correspondent Mr. E. S. Wamaker of Suffern, N. Y. has written the best explanation on this subject (which appeared in your journal of April 30th) that has yet been given in any paper, and evidently the result of careful thought and practical observation in the field. I can endorse its truth in this country, as my friends and self have frequently marked partridges down, walked to the spot, run the dogs over it again and again, and then literally walked the place over. I have seen the birds sitting, and dogs spring over them, and when the birds are in that frightened palpitating state, they will allow either dog or man to trample on them."

Mr. Laverack evidently thinks so much of Mr. Wamaker's communication to our journal that he says: "You will be kind enough to return the quail article enclosed. 'Do quail withhold their scent,' was long ago agitated in the English papers, but never was it described so lucidly before."

On the steamer which left Bremen for New York on Tuesday last were shipped six giraffes, consigned to our well known animal dealer, Mr. Charles Reiche. Some time ago we announced the arrival of Mr. Reiche's caravan, consisting of twenty-six giraffes, two elephants, and ostriches, emeus, and cassowaries at Alexandria. Another caravan is expected at Alexandria in a week or so. Giraffes, Mr. Reiche informed us, were worth some years ago as much as \$5,000 apiece, but dull times have affected the wild beast market. Mr. Reiche expects, however, that his giraffes will find ready sale at \$3,000 each. The two leopards which have been for some time on hand, were sold last week to the Philadelphia zoological association. Last Saturday Mr. Reiche made a shipment of seven beavers for Germany; among them was a mother beaver with four kits. A number of horse-shoe crabs were also sent to aquaria in Europe, and to the Paris *Jardin d'Acclimatation*, were shipped some of our monster bull-frogs.

THE MANATEE AT ST. AUGUSTINE, FLORIDA.—Some time ago we mentioned that a manatee had been seen near St. Augustine. We judged it to be a manatee from the description, and now there seems little doubt of it, inasmuch as the town people have "surrounded" the "critter." The latest news, as we learn from the *St. Augustine Press*, is as follows. We quote:—

"The manatee continues her domicile in Bar Creek. Fishermen have again reported it, and citizens are anxious to go after it; but we understand that the owner of the land which encloses Bar Creek claims it as his property, and has forbid any one from meddling with it, under a prosecution for trespass. The mouths of the creek are to be stopped by strong fences and the animal kept there, for exhibition next season. The enclosed space is also to be used as a reservoir for turtle, put there during the summer. There are also vague rumors of a very large animal of the same species having been seen roaming about a place on the North River called Oleander Town. If so, the one is probably the dam and the other the calf that have become separated. It is also probable that during some of the heavy blows along the coast between here and Indian River some herd of these animals has become dispersed and these two may have wandered into our harbor. It will be remembered that two or three years ago a very large one was seen in this harbor, which came up to the water-battery of the Fort, where it remained until pelted by the boys. Fishermen report them as having been frequently seen in the harbor."

SMITHSONIAN INSTITUTION, Washington, June 3, 1874.

EDITOR FOREST AND STREAM:—

Your correspondent at New Smyrna, Florida, (Mr. S. C. Clarke), in the last issue of your paper (May 28), alludes to two fishes of the Floridian waters known there under the names Tarpum and Jew fish, which he was unable to identify. It may interest some of your readers to know what they are.

The Tarpum is a gigantic herring-like fish characterized by its large eyes, large scales, the elongated thread-like last dorsal ray and numerous bony rays in the gill membrane. The scientific name is *megalops atlanticus*. Its beauty of form is such that it is said that a fountain in one of the public places in Paris was modelled after it. The species is an occasional visitor to our coast, whence two specimens have been obtained for the Smithsonian Institution—one from Long Island.

The Jew fish is a kind of grouper (belonging to the family *Serranidae*) and is more nearly related to our Sea bass than any species in our waters, with which our anglers are familiar. The scientific name is *Promocerus guasa*. It attains an enormous size, one weighing about 700 pounds having been sent to the Smithsonian Institution, where a cast taken in the flesh exactly reproduces its form and features while the skeleton enables its more fundamental characters to be studied.

The shark alluded to by the same correspondent cannot

have been the Sleeper or *Somniosus brevipennis*, as supposed by him, since that species is a Northern form, very rarely descending even as far South as Massachusetts.

Yours truly,

THEO. GILL.

THE DERIVATION OF THE WORD SHAD:—We find in Webster the word Shad derived from the Flemish or German *shade*. Originally the shad was called *alose* in Pennsylvania. Somewhere in Watson's Annals he speaks of *alose* being caught in the Delaware River. Writing to Professor Adler, of the Cornell University, he has kindly sent us the following letter:

LIBRARY OF THE CORNELL UNIVERSITY,
ITHACA, N. Y., June 5, 1874.

EDITOR FOREST AND STREAM:—

As regards the derivation of the word Shad, there is to my knowledge no generally received opinion among scholars. That it is related to the German *schade* seems plain. If I may be permitted to hazard a conjecture on a subject which is so far removed from the general course of my studies, it would be this: *Schade*, being the same as our English *sathe*, means not only to harm, but is also frequently used to indicate loss, or loss. The ideas of loss and worthlessness go together. Now, if it be recollected that the shad, under the name of *Alosa* is called contemptuously "the fish which sings in the poor man's pan," a connection between *schade* and shad might thus be conceived of. For the above notation see Grunnes' German Dictionary, *sub. voc.*, where you will also find that the fish has been called by a play on its name—*Alosa*, or *Alausa* ausefish. Yours truly,

FELIX ADLER.

FECONDITY OF FISHES.—It is said that probably about 1,000,000 or 70,000,000 codfish are taken from the sea annually around the shores of Newfoundland. But even that quantity seems small when we consider that the cod yields something like 3,500,000 eggs each season, and that even 100,000 have been found in the roe of a single cod! The fish, though not equalling the cod, are wonderfully productive. A herring six or seven ounces in weight is provided with about 30,000 ova. After making all reasonable allowances for the destruction of eggs and of the young, it has been calculated that in three years a single pair of herrings would produce 154,000,000. Buffon said that if a pair of herring were left to breed and multiply undisturbed for a period of twenty years, they would yield fish bulk equal to the globe on which we live. The cod surpasses the herring in fecundity. Were it not that the numbers of the eggs are destroyed, fish would so multiply as to fill the waters completely.—*Scientific American*.

MOON-EYE—*Hyodon Tergisus*. (Linn.)

LAKE CITY, Minn., June 1, 1874.

FOR FOREST AND STREAM:—

Concerning this beautiful fish very little appears to be known. I have yet met with anyone that could give me any information concerning it. Here, in Lake Pepin, it is simply known as a herring or "skipper." No. 2. But it is not a herring at all, according to my knowledge of ichthyology. Its usual length is 12 inches and width 3 inches; caudal, vent-shaped; dorsal, situated far back 2½ inches from tail, and has 12 rays; ventrals, about mid-way, 7 rays; anal, extending from ventral to tail (¾ inches), and has 28 rays. The eye, situated very far forward, is unusually large, hence his common name "Moon Eye." Well developed maxillaries, vomer, palatines and tongue. Color, pearly white to middle, thence darker to back. The nose projects over the jaw, and the mouth is small—not as large as the herring's (*Clupea harengus*). Of the habits of this fish no man, as far as I know, speaks. I know that he spawns in April, is known here from April until June, when he disappears. Where he goes I know not, have never heard of one being seen or taken in the winter. In some seasons seem to be quite plenty, and at others but very few are seen. On whole I have always regarded it as a rare fish. They are vigorous swimmers, and are as gamy as the striped bass (*Morone chirocentrus*). They take the minnow or fly, and are one of the smartest of fishes. They come up, taste of a fly, let go and be gone before the angler has time to strike. Therefore, to be a "Moon Eye" fly-fisher, one must be very quick and not read a book while casting, as I once knew a man to do. As being a food fish there is not a single doubt. I ate one this very morning for my breakfast, and it was excellent, the bones being far less numerous and of larger size than in the herring. There is not a single "dile" of bones as in the *Clupea*. I have been, and am still anxious to know, if this fish is common in other waters, and if anybody knows anything about the species.

D. C. ESTES, M. D.

PORTLAND, Me., May 28, 1874.

FOR FOREST AND STREAM:—

I have noticed a good deal of discussion in your and other papers as to whether Albinos are barren. I do not profess to know, but the prevailing opinion is *not*. Now, as it is difficult to ascertain by experiment with birds or beasts, will some scientific contributor of your paper ascertain the common pet white rabbit with pink eyes is an albino, and if so, the experiment and see if they will breed. Thus failing, let them turn their attention to white rats and white mice. Query? Does Melanorhina produce unusual fecundity? M. S.

ALBINOS are fertile, as instance white rabbits, mice, ferrets, Arctic foxes, Polar bears, *et cetera*. For remark-proof of Albinism in the Cervi see FOREST AND STREAM of June 4th, "Zoology of the Northwestern Territories." Melanism is not regarded by naturalists as any specially remarkable in any characteristic.—Ed.]

WESTON, Vt., May 21, 1874.

FOR FOREST AND STREAM:—

In dressing a trout recently I found the usual minute germs of the ova, as one separate and lower in the abdomen, rather larger than the size of the mature ova, very transparent, except in the centre there is a oval spot of light cream color the size of a No. eight pellet. I have met with a like circumstance. Is it rare, and can you account for it? Evidently the ova is of last year's growth. The trout was in size seven ounces, in good condition, and taken from the famed reservoir of this town. Yours very truly,

C. L. WHITMAN.

CENTRAL PARK MENAGERIE.

DEPARTMENT OF PUBLIC PARKS,
NEW YORK, June 7, 1874.

Animals received at Central Park Menagerie for the week ending June 4, 1874:

1 Eagle, *Haliaeetus leucocephalus*. Presented by Louis Spannhaake,

2 Cassowaries, *Casuarus galeatus*. Hab. Ceram.

3 Rhea, *Rhea Americana*. Hab. South America. Bred in the

menagerie.

4 Prawn, *Caridacus Virginianus*.

5 Wild Goose, *Bernicla canadensis*.

Woodland, Lawn and Garden.

THE ROSE GARDEN IN JUNE.

"Neath cloistered boughs, each floral bell that swingeth,
And tolls its perfume on the passing air,
Makes Sabbath in the fields, and ever ringeth
A call to prayer.

"In the sweet scented pictures, heavenly artist!
With which thou paintest Nature's widespread hall,
What a delightful lesson thou impartest
Of love to all."

THE great and rapidly increasing demand for rose gardens in our cities makes almost anything relating to the culture of these beautiful flowers acceptable. In this paper we shall name some of the best roses for easy culture, and which should be planted out as soon as possible to insure a good bloom the coming season. Although the rose is of such character that it will bear planting out at almost any time, yet the spring and fall months are preferable to any other seasons of the year. In the first place, after having nicely prepared your ground, plant such only as will enhance the beauty and picturesqueness of your garden. We will suppose you have a tolerably well arranged plot—perhaps a very beautiful one. Do not ruin it by too profuse pruning and thinning. Add on the outer border such small sized evergreens, as a sort of irregular belt, as will give a lively, green background for your roses, which you will set with the tallest bushes nearest to the evergreens, and the next smallest in the front or second row, always having an eye to the harmony of colors, as heretofore instructed.

All desirous of having a good show of roses should plant largely of those kinds that are known to be hardy and vigorous growers. Let what are called the "varieties" go; they are the novelties of the trade, and are often found to be the "miserables" of the rose grower, and in nine cases out of ten are vexatious to the purchaser. Remember that the new roses often offered are propagated to sell, and are a great "sell" to every buyer.

A lady friend asks, "How shall I plant?" I would say, first, the general arrangement of the place, and second, the execution of the work, are to be considered. To give any one rule, adapted to all localities, would be an impossibility where so many and varied natural advantages and disadvantages are to be encountered. Scarcely two places are to be found alike.

When you have already in your garden a tall growth of evergreens and such trees and shrubs as give a sort of privacy to your grounds, you have a ready-made screen or background to your bouquet similar to the one before named.

In naming some of the many different kinds of roses that grow well and give satisfaction under good culture, we give such as we have planted, and can recommend as always having done well with us. In the first division we place those that are perfectly hardy, and may be relied on. These bloom only once in the season, therefore you should select their location with care, for it is very disagreeable to have to take up a fine rose bush simply for the reason that you did not place it where you should have done in the first place. In the second division we place those roses which show their blossoms at different times in the season, from June to November. These are beautiful and very valuable roses. Although some of these roses are to be ranked as half hardy, yet with a little care—of which we shall tell you by and by—you can manage them as well as the hardy ones. Botanists of skill and extensive knowledge name between eighty and one hundred species of the rose, and mark with great distinctness the peculiarities of many kinds. To enumerate all the different kinds of roses would extend our papers to greater limits than would be advisable at this time.* We note in this paper many of the older kinds, the best, and such as can easily be obtained of almost any nurseryman and florist.

Among the summer roses we name Harrison's yellow, Persian yellow, William's yellow, Austrian yellow, Prairie, Boursault, Ayrshire, Baltimore belle, Mrs. Hovey, Queen of the prairies, Aureti, blackish purple; Province, hybrid; Boule de Nantuel, fine crimson; Belle de St. Cyr, bright rose; Coupe de Hebe, pink; Chenedolle, bright crimson; Duke de Orleans, spotted with white; Duchess de Abrantus, rose color; Elizabeth Ross, pale rose, white spotted; Eugenie Beauharnais, crimson; Fabier, scarlet; Glorie des Mossense, long double blush, a very fine, hardy rose; George IV., rivers, superb crimson; Hybride Blanche, white; Heureuse surprise, carmine; Herman Kegel, crimson violet, white striped; La Rene, Leopold premier, Lord Clyde, Laura Devost, white; moss common, moss crusted, moss single, moss white, moss Adelaide.

Among the choice dwarf varieties of roses we have cultivated, and which we can recommend favorably to our readers, we name the Norsette, cluster roses; Alba, creamy white; Aimee vitant, pure white; Bengal See, blush, very fragrant; Compté de Grillon, blush; Chromotelle, large yellow, compact; Euphrosine, pale yellow.

Of the climbing varieties all these are rapid growers, and when intermingled with the Japan honeysuckle are very beautiful to behold. These require good soil, with a little sand and charcoal, finely pulverized. The finest are the Banksia Lutea, double yellow; Banksia Alba, white; Bour-

*In a work upon the "History and Culture of the Rose," now nearly completed, and soon to be published, we shall give a complete list of all the common as well as rare rose plants.

†Climbing roses for screens and pillars. These add a very important feature to the surroundings of a cottage garden, and some of them will cover a large space in the garden.

sault, purpurea; Russellinia, striped red and white. To this collection we would add the hybrid Province roses, as they are a variety that always please. They are produced by a cross between French and Province roses; in this new form of beauty they unite the well known characteristics of the long cones or shoots of the one, and the dense foliage of the other. They are generally very hardy in habit, and are quite a novelty in the garden. Standard roses, as Madam Provost, Geant des Batailles, La Rene, and La Marque make fine effects when planted in groups of six and eight upon the lawn or upon the sides of the carriage way, if not placed too near the road.

Look well to your rose plants, and apply occasionally a liquid fertilizer at evening, and you will have in due course of time a fine show of roses that will fully repay all your care.

OLLIPOD QUILL.

GRASS GARDEN WALKS.—After having been bothered for years by grass and weed grown walks, I determined to conquer the enemy by a masterly surrender. I therefore spaded up all my walks, adding enough good soil to raise them to a level with the adjoining beds; raked and rolled them till they were firm and even, and then sowed them thickly with "mixed lawn grass seed," scratching it in with a rake, and giving a final going over with the roller, and awaited the result. In a very few days (not over three weeks) I had the pleasure of walking on green velvet instead of gritty gravel; and with the help of a lawn mower, and an occasional cutting down of the edges true with a sharp spade, had no further trouble with my walks. Always green and pleasant to the foot and eye, never wet (being above the garden level), they are "a joy forever," and the perfection of garden walks.—*Country Gentlemen*.

—Rose bushes and other garden shades will be much benefitted by a top dressing of pulverized charcoal and ashes. Prune the rose bushes when the blooming season is over, cutting off the old wood that has produced the flowers, to make room for a new growth. In the herbaceous department of the flower garden weeding, transplanting, and watering are the principal operations to be performed this month. Additional planting of some annuals, however, such as balsams, zinnias, and nasturtiums may be made; and dahlia roots may still be planted.—*Farm and Fireside*.

THE FLOWER GARDEN.—Liquid manure has a wonderful effect upon garden plants, and may be used both in the vegetable and in the ornamental departments. The best time to apply it is just before a shower. For tender flowering plants it must be weak. A tablespoonful of guano, or a small handful of fowl droppings to a gallon of water, will make it strong enough. Soap suds may be used in the same way.

MICHIGAN LUMBER.—The long continued rains which have spread famine and desolation at the south, and death and destruction in Massachusetts, has enabled the Michigan lumberers to make a clean sweep of all the logs which have been cut during the last winter, as well as those hung up during preceding seasons. Notwithstanding this, the supply will be short, as last season's operations were limited.

Yachting and Boating.

All communications from Secretaries and friends should be mailed no later than Monday in each week.

HIGH WATER, FOR THE WEEK.

—The ninth annual regatta of the Atlantic yacht club, a report of which will appear in our next issue, was sailed yesterday, June 10th. The yachts divided into three classes—schooners, first class sloops, and second class sloops. The course assigned for schooners was from the starting point through the Narrows, to and around the stake boat at Southwest Spit, thence to the light ship, rounding her and returning home, passing to the south and west of Romer's Beacon. First class sloops the same course to the Southwest Spit stake boat, thence around stake boat in Gedney's channel, and home, passing to the westward of Romer's Beacon. Second class sloops over the same course to and around Southwest Spit and return. All vessels outward and homeward bound to pass between forts Lafayette and Wadsworth. Schooners a flying start. All sloops to start from their anchors, with the privilege of slipping if they desire. The following list of entries of the club undoubtedly made a fine showing, but as the race was not concluded when we went to press we can give no report:—

SCHOONERS.

Name	Owner	Mean Length	Allowance
		Feet	M S
Briton	G. A. Thayer	65	6 —
Peerless	J. R. Maxwell	65	2 —
Agnes	E. Harvey	57	9 7
Tidal Wave	William Voorhies	(probably)	40

FIRST-CLASS SLOOPS.

Orion	J. W. Cooper	48	7 —
Jennie M.	J. A. Monsell	41	3 —
Kaiser Wilhelm	Norris & Greenleaf	40	9 37
Anna	W. A. Cumming	39	7 11
Alert	Henry Vail	39	7 —
Recreation	George A. Weber	38	13 —
Kate	E. L. Lawrence	37	10 13

SECOND-CLASS SLOOPS.

Ida	W. E. Greenleaf	32	7 —
Flyaway	V. B. Livingston	32	6 —
William T. Lee	Charles F. Cheever	27	6 7
Barbara Fritchie	J. R. Rhodes	24	4 14

—The regatta of the New York yacht club takes place today, and is, of course, from the size of the club, and the tonnage and number of the vessels, one of the most important yachting events of the season. The middle of June, however, is most uncertain in point of weather.

ous have been literally ruined by absence of wind. We hope sincerely we may not have to chronicle in our next another drifting event—race is not the proper word. Four prizes, of the value of \$250 each, will be contested for—one for first class schooners, measuring 7,000 cubic feet and over, one for second class schooners, measuring less than 7,000 cubic feet, one for first class sloops, measuring 2,000 cubic feet and over, and one for second class sloops, measuring less than 2,000 cubic feet. These will be sailed for without time allowance, under the sailing regulations of the club. The Bennett challenge cup, returned to the club by the former owner of the Madgie, is also to be sailed for, with time allowance, upon this same occasion. The regatta committee for this year are Messrs. Wm. Krebs, Edward B. Chase, and Wm. B. Bend. The entries are as follows:—

FIRST-CLASS SCHOONERS.	
Tidal Wave—William Voorhis.....	Phantom—William Osgood.
Idler—S. J. Colgate.....	Eva—General E. Burd Grubb.
SECOND CLASS.	
Clio—Ashen & Bradhurst.....	Magic—W. T. Garner.
Cornelia—Dr. Vondy.....	Peerless—J. R. Maxwell.
FIRST-CLASS SLOOPS.	
Vision—J. J. Alexander.....	Vindex—Robert Center.
Gracie—Mr. Waller.....	
SECOND CLASS SLOOPS.	
Vixen—W. T. Garner.....	Alert—Henry Vail.
Kate—R. Dillon.....	Breeze—H. P. Kingsland.

—On Friday, the 12th instant, the first race of a series, arranged between the Madeleine, Commodore Jacob Voorhis, and the Tidal Wave, Ex-Commodore Wm. Voorhis, will be sailed. The course to be twenty miles to windward and return for a \$500 cup, or for a dinner for 100 guests.

—It is expected that a match between the Columbia, Mr. Lester Wallack, and the Madeleine, will follow the one mentioned above.

—Mr. Louis Lorillard has sold his beautiful schooner the Wanderer to Mr. E. Bird Grubb.

—The Vindex, Mr. Robert Center, the Kate, Mr. E. Z. Lawrence, the Albert, Mr. Henry Vail, and the Addie, Mr. Roosevelt, have all formally entered for the Flag officers prize in the Corinthian sloop race, to be sailed under the auspices of the Seawanaka Yacht Club, July 3d.

—The Oneida Boat Club, of Jersey City, held its fifth annual regatta on Saturday last. Opening race between two men in working boats over half mile course twice around, won by Mr. C. F. Okerhausen. Second, shell race, two entries, the winner, Mr. V. D. Schanck completing the course in four minutes fifty-five seconds. Third, barge race which excited considerable enthusiasm, and to complete the programme was a match between a four-oared gig and a shell; the shell was handicapped an allowance of three-quarters of a minute at the start, the gig won in eleven minutes.

—The Stapleton Yacht Club has had an addition to its fleet during the winter of three new boats, the Amelia, the Josephine and Mr. Morris' yacht, which has just been completed at Clifton, S. I. The club held a meeting last night for the election of officers, and the deciding upon a day for their summer regatta.

—Commodore Tinan has entered his yacht the Elizabeth for the Brooklyn Yacht Club regatta, confident, we suppose, that twenty-nine feet boom and twenty-six feet of bowsprit outboard will enable him to carry off the prize of his class.

SOUTH BOSTON YACHT CLUB REGATTA.—The first regatta of the South Boston yacht club of this season occurred Thursday afternoon. The weather was very undesirable for the race, and in consequence few boats participated. The judges' yacht was the Carrier Dove, Captain Barker, and she was moored off the yacht club house at City Point. There was a tolerably strong and steady wind, mainly from the east, during the whole afternoon. The first class boats sailed over No. 1 course, and the second class sailed over course No. 2, (see our issue of April 30th). All yachts were sent off with a flying start, ten minutes' time being allowed after the firing of the signal gun for yachts to cross the line. The gun for the first class was fired at 2:30, and for the second class at 2:45. The following is a tabulary statement of the result:—

FIRST-CLASS KEELS.		Length		Start		Return		Correct Time	
Yacht and Owner		ft in	h m s	h m s	h m s	h m s	h m s	h m s	h m s

Th Naiad Queen and Rover were ruled out for starting behind time. There were two prizes for each class, including keel and centre board yachts, but as in the first race there was but one keel boat, but one prize was awarded. The prizes were silver cups and vases, the first prize to keels being awarded to the Starlight. The first prize to first class centre boards was awarded to the Queen Mab, and the second to the Posey. The first prize to second class keels was awarded to the Fearless, and the second to the Uncle Moses. The first prize to second class centre boards was awarded to the Maud, and the second to the Lizzie. The judges were Messrs. Thomas Christian, W. W. Hawes, P. P. McDonald, and J. G. Chambers. Commodore Roberts handsomely entertained many guests, including the press, on board his yacht, the Mercury.

PORTLAND YACHT CLUB.—The regular monthly meeting of this club was held Wednesday evening, June 3d, at their club rooms, in Portland, Maine. The club unanimously passed the exceptional compliment of placing the name of ex-Commodore James M. Churchill upon the list of honorary members for his valuable services and unselfish interest in the welfare of the institution. The following route was decided upon for the annual cruise—to Boothbay, Wiscasset, Bath, and return, via New Meadows, the trip comprising about a week. An invitation has been extended to the South Boston Yacht Club to join in the annual cruise. A vote of thanks was passed to Messrs.

Senter & Co., of 54 Exchange street, for the present of a beautiful and valuable spy glass. Samuel E. Smith, Esq., of Wiscasset, has joined the club, and added his beautiful yacht Idlewild to the fleet. There is a growing interest among Portland people in aquatic sports.

REGATTA OF THE DORCHESTER YACHT CLUB.—The Dorchester Yacht Club sailed their first championship regatta in the thunder storm Saturday afternoon, June 6th, in Dorchester Bay off Commercial Point. The start was made at about half-past two o'clock. The yachts were divided into six classes, the fourth class centre-board sloops taking the course No. 3 of 5½ miles, and the rest course No. 2 of 9½ miles. Twenty-seven yachts started, but several did not return in season for their time to be taken. The result was as follows:—

FIRST CLASS CENTRE-BOARD SLOOPS.		Actual Time.	
Yacht.	Owner.	Hr. Min. Sec.	
Cimbus.....	E. Burgess.....	1 05 00	
Lillie.....	Babb.....	1 51 30	
Kelpie.....	Capen.....	2 03 45	
Jessie.....	Park.....	Not taken.	
SECOND CLASS CENTRE-BOARD SLOOPS.		Actual Time.	
Mabel.....	Roberts.....	2 13 00	
Firefly.....	Balch.....	2 19 20	
Alice.....	Smith.....	Not taken.	
THIRD CLASS CENTRE-BOARD SLOOPS.		Actual Time.	
Maud.....	Fuller.....	3 16 00	
Water Witch.....	Pettengill.....	2 25 40	
Ida.....	Holmes.....	2 30 50	
Peri.....	S. W. Burgess.....	Not taken.	
Misti.....	Weatherbee.....	Not taken.	
FOURTH CLASS CENTRE-BOARD SLOOPS.		Actual Time.	
Tulip.....	W. Burgess.....	1 51 25	
Virginia.....	Plimpton.....	2 03 15	
Rocket.....	Bass.....	2 04 30	
Bessie.....	Lewis.....	2 04 44	
Hecate.....	Loring.....	2 08 00	
Rob Roy.....	Perrin.....	2 08 30	
Coro.....	Patten.....	2 08 41	
Dolphin.....		Not taken.	
FIRST CLASS KEEL SLOOPS.		Actual Time.	
Sunbeam.....	Nickerson.....	2 40 15	
Johnnie Sands.....	Chapman.....	2 44 20	
Volante.....	Barnard.....	Not taken.	
Agnes.....	Adams.....	Not taken.	
SECOND CLASS KEEL SLOOPS.		Actual Time.	
Fearless.....	Woodward.....	2 33 20	
Rubie.....	Preston.....	2 38 05	
Phoenix.....	Chapman.....	Not taken.	

The winning yachts were Nimbus, Mabel, Maud, Tulip, Sunbeam and Fearless. As the championship of the different classes is best two in three, two similar regattas will be held, the next coming upon the 20th of June. The judges Saturday were Wm. A. Gilbert, Wm. H. Bangs, Jr., and Wm. T. Adams.

CITY POINT, SOUTH BOSTON.—The last week in May introduced to the briny element the schooner yacht Kittie, Capt. John M. Ward, who will ere many days take his departure for his regular summer cruise. Capt. Ward's schooner Bessie was also launched, and awaits a purchaser. Also the schooner Haze, Capt. Moody, sloops Starlight, Ex-Commodore F. S. Wright, Planchette, Capt. Johnson, Gracie, Capt. Williams, and Allie Vining, Capt. Davis.

PHILADELPHIA, June 8th, 1874.

EDITOR FOREST AND STREAM:—

The annual regatta and excursion of the Philadelphia yacht club will take place on Monday, June 15th, starting from Shackamaxon street wharf at ten o'clock, the course being up the river to round the buoy boat at Delanco, and return to the home buoy at the water work's wharf. There were eighteen first class and twenty-five second class boats entered:—First class—George Hoff, Albert Dager, Kate D. Eakins, Benjamin P. Sparks, M. L. Standiford, Tyler Hamilton, Charles A. Bush, Harry Strimmell, Albert T. Eggleston, Jonty Hillman, Charles Hillman, Henrietta, William H. Clymer, Charles S. Austin, Kate Leary, Willie Kleintz, A. Artis, and Mattie. Second class—Lilian, John Wilson, Sr., Leo Reinfried, Dollie Tilton, John B. Brewer, John D. Sidebotham, Charles Able, Richard F. Riddell, Shackamaxon, Enchantress, S. A. Standiford, S. A. Mariner, Ida May, George R. Jesson, Mary Ann, Joseph H. Leary, Edward Ebener, Annie E. Ormrod, Eliza Brode, George Lewis, William D. Wieland, Little Maggie, Mary Emma, Julia, and Correll B. Miller. The prizes offered are two for each class, and same for each. First prizes—Handsome silver swinging ice pitchers, with silver cup accompanying. Second prizes—Handsome silver castors. A large and commodious steamboat, with first class music and refreshments on board, will accompany the fleet.

DETROIT, MICH., June 5th, 1874.

EDITOR FOREST AND STREAM:—

By request I send you accounts of our two first races of the International Yacht Club. These two races passed off so pleasantly that we feel very much encouraged for the success of our club. Our account is summarized from the Detroit Post.

The races for our first and second class yachts have been postponed to accommodate the Canada yachts. The races will take place as follows: 1st, for first and second class yachts at Put-in-Bay, on Lake Erie, on June 29th; third class yachts at Grose Isle, on Detroit River, July 1st; and first and second class yachts at Detroit, on Lake St. Clair, July 4th. We shall offer cash and other handsome prizes, and are looking forward to a very pleasant time.

Yours truly,

C. B. HULL,
Rear Commodore.

—The first regatta of the International Sail Boat Club, for boats of the third class, 20 feet in length or less, took place on the river on the 2d June. The following named boats participated:—Nettie, Captain C. B. Hull; Carrie, Captain K. C. Barker; Fannie, Captain Henry Whiting; Allie Burk, Captain W. H. Burk; Stranger, Captain H. H. Smith; Lulu West, Captain A. H. West; Lillie, Captain William Wright.

At the signal gun, fired from Commodore K. C. Barker's large sail yacht anchored off the Detroit boat-house, the boats at that time headed up the river, swung around as if on pivots, and went off like gulls, a very fresh wind being then almost directly aft. They made the run to the lower stake boat in 11 minutes, rounding it all in a bunch. This brought the wind dead ahead, and the boats then had to beat five miles to windward. After a time the wind fell, promising a tedious race, but soon freshened again to a stiff breeze from the South. At 1:23 o'clock, 2 hours and 25 minutes after the start, the Lulu West went round the upper stake-boat. The time of rounding of each boat was as follows, the start having been made at 10:58 o'clock:

H. M. S.	
Lulu West.....	1 23
Nettie.....	1 26
Allie Burk.....	1 36
Henrietta.....	1 55 30
Carrie.....	1 57 30
Lillie.....	2 06

The Fannie and Stranger, finding themselves getting left in beating up against winds, withdrew.

At half-past six o'clock the Lulu West shot past the home buoy, followed, three minutes later, by the Nettie, the Allie Burk being third, 10½ minutes behind the West. This apparently gave the race to the Lulu West, but the Nettie was allowed the prize on account of time allowance for the West's excess of canvas.

Upon the result being announced by the judges, S. R. Kirby, Mr. Hull and Mr. West, the owners of the winning boats, were escorted on board Commodore Barker's yacht and presented with the prizes, that won by Mr. Hull being a massive piece of plate known as the "Barker Cup," and that won by Mr. West being a miniature compass, presented by Mr. J. P. Donaldson.

On the following day there was a race for yachts of the second class, the boats starting from off the foot of McDougall avenue, sailing up to Lake St. Clair by way of the American channel, and about six miles into the lake, round Cunningham's steam yacht, anchored as a stake-boat, and return by the same course. As on Tuesday, the steamer Dove, the steam and the sailing yacht of Commodore Barker following the race throughout, a large number of spectators thus being afforded an excellent view of the contending boats from the start to the finish, a period of four hours.

They passed the line in the following order, the difference being taken into account at the close of the race:

H. M. S.	
Adelaide.....	10 36 4
Adele, George S. Davis.....	10 36 20
Whistlewing, H. Hunter.....	10 36 44
Fleetwing, James Craig.....	10 36 55
Lalla Rookh, C. B. James.....	10 37 28

The wind was south, a fair breeze blowing, and the yachts went off before it in handsome style. After reaching the lake the wind was variable, sometimes nearly dying out) and then coming in a strong gust. The stake-boat had been placed far to leeward, but the yachts ran down with the wind a-beam in good style, passing the stake-boat in the following order:

H. M. S.	
Fleetwing.....	12 19
Adele.....	12 29 20
Lalla Rookh.....	12 30
Adelaide.....	12 30 30
Whistlewing.....	12 49

Soon after commencing to beat back toward the head of Belle Isle the wind blew fresh, but afterwards fell light, and the Fleetwing, with her immense spread of canvas came in first by one minute and thirty-nine seconds. The allowance in time the Fleetwing had to give the smaller yachts gave the first prize, a marine glass and case, presented by M. S. Smith & Co., to the Adelaide, and the Fleetwing won the silver goblet and cup, presented by the same firm. The time when the boats reached the home stake, excepting the Whistlewing, which did not put in an appearance, was as follows:—

H. M. S.	
Fleetwing.....	2 30 21
Adelaide.....	2 32
Adele.....	2 52 30
Lalla Rookh.....	2 56 55

PORTLAND, Me., June 1, 1874.

EDITOR FOREST AND STREAM:—

At a meeting of the Maine Boating Association, held at the Preble House on the evening of May 29, the resignation of the Glean Club, of Bath, was accepted. It was voted to hold a regatta in Portland Harbor on July 4, number and class of races to be decided by the Regatta Committee of the Association, which meets June 5. The new boat-house of the Emerald Club, on Maine Wharf, is nearly completed, and will be occupied the latter part of this week. The "Longshore" four are availing themselves of the hospitality of the Orient for the present, and have just begun work for the season. They intend to put in an appearance at the principal regattas in New England and the Provinces.

The Bowdoin Freshmen have lately purchased a six-oared, out-rigged lapstreak (Elliott build) of the Emeralds for a "breaking-in" boat, but as the three lower classes are at present enjoying (?) a vacation, until the differences of opinion existing between them and the Faculty are overcome, it is not likely that much pulling will be done there until the fall term. Our single scull men are commencing work, and some matches are expected to be forthcoming ere long.

VIDI.

NEW YORK, June 4, 1874.

EDITOR FOREST AND STREAM:—

Lately there has been organized a yacht club at Far Rockaway, L. I., called the Rockaway Yacht Club. This club has but few boats, but it must be excused, for those to whom they belong are the gentlemen that dwell there only in summer, and many of them do not like yachting or have not time to attend to it. The club consists of from 75 to 100 members, and among them there are only twelve yachts. The officers are as follows: Commodore, Nathaniel Jarvis, Jr.; Vice-Commodore, Fred Nelson; Treasurer, Charles A. Cheever; Secretary, Daniel Lord, Jr.; Measurer, Mr. Lord.

Name.	Rig.	Dimensions.	Owner.
Peerless.....	Sloop	33 feet	Joseph Donohue.
Halcyon.....	Sloop	32 feet	Charles Cheever.
Marlyon.....	Sloop	27 feet	Nathaniel Jarvis, Jr.
Marlyon.....	Sloop	38 feet	Charles Cheever.
Stella.....	Cat	22 feet	John Cheever.
Gariota.....	Cat	25 feet	Daniel Lord, Jr.
Uncas.....	Cat	20 feet	Ed. La Montagne.
Bumpo.....	Cat	19 feet	Nathaniel Jarvis, Jr.
Nat.....	Cat	11 feet	H. Langdon.
Mosquito.....	Cat	15 feet	D. D. Lord.
Eureka.....	Cat	18 feet	Frank Lord.
			Louis Donohue.

The regattas last summer were all of a very brilliant character. The Uncas, owned by Ed. La Montagne, carried off many of the laurels last year. She won the challenge cup of her class, and probably she will have a great many boats to contest with. She is not at all a good-looking boat. She is plain, open cat-rigged. The Halcyon, the fastest yacht of her class, has been changed this year, and is expected to beat the Blossom, of the New Jersey Yacht Club. The Peerless, built for Mr. Maxwell, Commodore of the Atlantic Yacht Club, is also a very clever boat. During the coming season we hope that these boats will have a chance to show their speed. The annual regatta will take place on the 4th of July for all classes.

J. L.

June 6, 1874.

EDITOR FOREST AND STREAM:—

I noticed an inquiry by one of your correspondents about the Barnegat sneak-boxes, and enclose a sketch showing the form and dimensions of one that was purchased for Bloomingrove Park. The best are made by Jesse Terrine, of Barnegat, and cost about \$40. They are built of cedar, and copper fastened, carry a sprit sail, and are safe in a moderately heavy sea; steered with an oar, though sometimes fitted with a rudder.

The rowlocks are of wood, hinged and lay on the deck when not in use. The gunner lies on the bottom with head resting against the bow combing and eyes level with the hatch, the entire boat being covered with sea weed or grass; the sneak-box is hauled on shore into a depression in the sedge, if possible. It requires two persons to haul them on mud flats. They are the best ducking boats I have seen, and are quite convenient for fishing. In rough water a breakwater of canvas is raised on a stick to keep off the spray. The Barnegat gunners furnish an extra sneak-box for each sportsman, although at the head of the bay I have been out with three persons in one sneak-box. Sail, oars, centre-board and frame for holding stools are laid under the decks. The keel extends about half the length from the stern. The centre-board is narrow and curved.

JOHN AVERY.

CANOEING.

NUMBER FIVE.

THE handling of a Nautilus or sailing canoe differs so materially from the manner of working other small sailing boats that a few hints on the subject may be useful to some of our readers. Paddling is a subject upon which we have little to say; it will come naturally to beginners, and in learning we should advise from the very first the use of the jointed paddle described by our correspondent, C. M. D., with the planes of the blades set at right angles to each other, so that when one blade is in the water the other feathers in the air. Keep the paddle as near the side of the canoe as possible during the whole stroke. It is advisable to have small grommets worked, or india rubber rings fitted on the looms of the paddle, well out towards the blades, to prevent the drip of water into the well or upon the lap should the apron be off. We prefer a nine foot paddle to one eight feet in length when it is jointed in the middle and will consequently stow.

Before getting our canoe under way some form of steering gear must be adopted, and we would advise a yoke on the deck forward of well coaming, to which the lines from the yoke on the rudder head should be led after passing through the necessary fair leaders on the deck of the canoe. This makes a continuous gearing, and the rudder may be moved either way by the use of the line on one side alone. It is very convenient to have a yoke under the forward deck, and secured to the same spindle as the one above for the use of the feet, for although the steering of a canoe is entirely too delicate a matter to be entrusted to the feet as a rule, it is still a great assistance to be able to keep the helm where it is wanted, and have the use of the hands in "working ship."

Ballast in a canoe intended for travelling, even though she be a sailing canoe, is utterly out of place. A canoe should be so designed and rigged that the stores and traps, which are necessities, together with the weight of the canoeist, should give her all the requisite stability. Nor is this at all difficult. We know of canoes carrying, on cruises, eighty square feet of sail, without a pound of ballast other than such as is mentioned above. Of course, when out for a short sail, thirty or forty pounds of sand in a bag will make the canoe handle better than when light.

The trim of the canoe is most important, and will affect her steering at once. Supposing her to have been well designed, and the sails calculated for a certain centre of lateral resistance, as was the case in the sail drawings published in the FOREST AND STREAM recently, it is perfectly evident that if in stowing the weights she is put down by the head or by the stern, she will when under way pivot to a certain extent on the end too much immersed, and luff, or pay off, as the case may be, requiring rudder to keep her straight on her course, and the drag of the rudder is death to speed, particularly in a boat so light as a canoe. In sailing, always bear this in mind, and give the canoe just as little helm as is possible. If the boat is properly hung, an inch or two of yoke line, either one way or the other, will be all sufficient.

Having gotten into the canoe, and seen by her water line that she is properly trimmed, we proceed to make sail. Step the masts, bend on the dandy sheets and jib out haul, which always keep rove, owing to the impossibility of getting out to either end to reeve them when once aloft. If there is plenty of sea room, hoist away your dandy and trim aft the sheet, which will keep the canoe head on to the wind; then man the jib out-haul, and when out and fast the jib halliards keep the jib sheets flowed; let go the brails to the mainsail, which will drop the boom down to its proper position, then man the mast rope, hoist away, make fast, and the mainsail is set.

Ease off the dandy sheet and catch the jib to windward to pay her off on the tack desired. If she makes stern way shift the helm accordingly, trim aft the main sheet, and as she gathers way let go and haul the jib. When once under control of the rudder trim the dandy by the mainsail. If the course is to windward give her a "good full" and let her go. Never jam a canoe too close on a wind, for although she may point up well, if she is not going fast through the water she will make lee-way.

In putting a canoe about, don't stop her way with the rudder. First of all, flatten aft the dandy sheet, then give her a little helm, keeping fast the jib sheet, which, as she comes head to wind, will presently catch to windward, then let go the dandy sheet, and the canoe will be in the same position as we described when getting under way, and should be handled in the same manner.

Wearing a canoe is simple, and there will be no opportunity for missing stays. Put the helm up, easing off the dandy sheet at the same time. Keep the main sheet properly trimmed, according to the way the wind bears upon the canoe as she pays off. Swing the dandy boom over first, and see that the main sheet does not foul anything when that sail swings, or there will be a mess indeed if there is any breeze at the time. Trim the jib last. In running off the wind, if it is blowing at all, and particularly when there is any sea, take the dandy in, as it will make her yaw about, and possibly broach to.

Never use a paddle when under sail, unless in cases of extreme necessity, for paddling a canoe around is so simple an operation that working her properly with sail will never be learned and the canoe will always be unsafe under sail. Always steer with the yoke rope, which is on the weather side.

—On Tuesday, June 2, a very close and exciting game of ball came off on the Union grounds at Melrose, between the Athletic of New York vs. Baltie of Harlem, both amateur clubs, in which the Baltie came off victorious, by the score of 9 to 6, in one hour and 40 minutes.

Rational Pastimes.

—The Manhattan club have, by the efforts of Messrs. Bowman and Satterthate of the St. George Club been enabled to use their old field every Tuesday during the three months vacation of the Stevens Institute, and they will have their opening game at Hoboken on June 16th.

—The Yale College "blues" have been showing more skill as an amateur base ball nine this season than ever before and thus far they rank at the head of the class. The record of their practice games with professional nines, alone proves how capably they play on the field. Their games thus far have been as follows:—

April 18—Yale vs. Hartford at Hartford.....	2 to 12
May 6—Yale vs. Hartford at New Haven.....	4 to 6
May 27—Yale vs. Atlantic at New Haven.....	3 to 8

9 26

Their contest with amateur nines thus far simply proves the statement made in this paper, before, viz:—That it is to the college nines that we must eventually look for the best display in the amateur arena. Their amateur record so far, is as follows:—

May 15—Yale vs. Flyaway at New Haven.....	15 to 5
May 30—Yale vs. Nameless at New Haven.....	19 to 6
June 6—Yale vs. Knickerbocker at New Haven.....	9 to 5

They have thus far defeated the strongest of the New York and Brooklyn nines without difficulty. Their last game was played without the services of their regular pitcher and hence the close contest. All are looking forward to their first meeting with the Princetons, which game if the Yales play up to the mark, will result in another victory for the "blues." After June 26, the blues will have some practice games with the Hartfords prior to their matches at Saratoga in the college tourney to be held there.

—The second elevens of the St. George and Staten Island clubs played a four innings match together on the afternoon of June 3d and 4th at Hoboken, which proved to be an amusing contest. The Staten Island party did not muster in force, only ten being on hand on Wednesday and but eight on Thursday. The St. George had out a full eleven. The fun of the contest was in seeing the St. George batsmen retire in succession for small scores before the ten-pin style of bowling of the Islanders, Clarke taking the wickets of Talbot, Perryman, Blake, Green and others by balls, which did not leave the ground from the bowler's hand to the stump. But for some wide bowling by a novice and other extras, the Islanders would have won, as they made the best score off the bat. The score of the first innings was 51 to 29 in favor of St. George, and of the second 33 to 32 in favor of the Islanders, the former winning the match. Old Tawny Smith's bowling was effective on the St. George side, and young Shippen bore off the palm in the field; the brothers Eyre played well. On the other side, Marsh and Irving showed good wicket and Davridge and Watson the best defense, Gardiner batting for double figures in base ball style.

The record of games in the professional arena since our last issue is as follows:

June 2—Philadelphia vs. Mutual at Brooklyn.....	8 to 7
June 2—Athletic vs. Atlantic at Philadelphia.....	17 to 3
June 3—Boston vs. Chicago at Chicago.....	11 to 10
June 4—Philadelphia vs. Mutual at Philadelphia.....	2 to 0
June 4—Baltimore vs. Atlantic at Baltimore.....	7 to 5
June 5—Hartford vs. Atlantic at Brooklyn.....	8 to 1
June 5—Athletic vs. Mutual at Philadelphia.....	13 to 2
June 6—Mutual vs. Hartford at Brooklyn.....	5 to 2
June 6—Boston vs. Chicago at Chicago.....	9 to 2
June 8—Chicago vs. Boston at Chicago.....	8 to 3
June 8—Athletic vs. Philadelphia at Philadelphia.....	12 to 4
June 8—Mutual vs. Baltimore at Baltimore.....	8 to 1

The championship record to June 9th is as follows:

Club.	Athletic.	Atlantic.	Baltimore.	Boston.	Chicago.	Hartford.	Mutual.	Philadelphia.	Games Won.
Athletic.....	0	2	2	0	1	1	1	4	11
Atlantic.....	2	0	2	0	0	0	0	0	4
Baltimore.....	2	1	0	0	0	1	0	0	4
Boston.....	2	2	3	0	2	2	4	3	18
Chicago.....	1	0	0	1	0	2	0	0	4
Hartford.....	1	1	2	0	0	1	1	0	5
Mutual.....	1	1	2	0	2	1	0	0	8
Philadelphia.....	0	1	2	0	0	1	2	0	6
Games lost.....	7	8	14	3	5	8	8	7	60

The best games in the amateur arena since our last have been the following:

June 2—Champion vs. Essex at Newark.....	13 to 7
June 2—Amity vs. Chelsea at Prospect Park.....	16 to 10
June 4—Chatham vs. Jasper at Manhattanville.....	17 to 11
June 4—Hartford vs. Princeton at Princeton.....	14 to 6
June 6—Zephyr vs. Star at Hartford.....	13 to 8
June 6—Yale vs. Knickerbocker at New Haven.....	9 to 5
June 6—Zeno vs. Dalton at Prospect Park.....	10 to 7
June 6—Manhattan vs. Powhattan at Hoboken.....	13 to 8
June 6—Phoenix vs. Union at Central Park.....	14 to 11
June 6—Leader vs. Nassau at Central Park.....	8 to 3
June 6—Glastenbury vs. High School at Hartford.....	15 to 7
June 6—High vs. Normal School at New Britain.....	17 to 13

—Mr. William Borst on Saturday last accomplished the feat of walking and running 21½ miles in 3 hours, 11 min. 3 sec. The distance was from Broadway and Twenty-ninth street to Jerome Park and back. The weather was in every way against the accomplishment of the feat, being thick, sultry and oppressive, and the ground in bad condition. The feat is a clever one, and very few professionals can beat the time.

SYRACUSE, June 5th, 1874.

EDITOR FOREST AND STREAM:—

I have been reading your paper for the last three months, and wish to add my humble opinion to the widespread appreciation of its excellence. I am particularly pleased with the deserved prominence you give to cricket. This, I think will do very much to foster the game. I beg to send you for publication the names of the officers of one of the most thriving cricket clubs in the State, to wit:—The Syracuse Cricket Club—President, Henry Pearson; Vice President, Alfred Tily; Treasurer, Reuben Ford; Secretary, Wm. Cowie; Captain, Charles Barnes; Committee—James Barnes, Edward Kent, Charles H. Filkins, J. J. Town.

The club had a very successful season last year, not suffering a single defeat. This spring extensive improvements have been made upon the ground, which, barring a rather uneven outfield, is now in capital condition. A club match, the first of the season, will come off on Thursday, 11th instant. We expect to be stronger this year than ever before. To conclude, Mr. Editor, we would have it known that there is a good live cricket club in Syracuse, willing to maintain its laurels against all comers, and zealous in all things tending to promote the true interests of the noble game.

Truly yours,

WM. COWIE.

Answers To Correspondents.

We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfit, implements, routes, distances, seasons, expenses, remedies, trails, species, governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous Communications not Noticed.

Pistol.—Reply in our next.

Saxon.—Your exception is well taken. Will adopt your suggestion.

J. V. D. Walker, Newark.—Write to Dr. Slack, Bloomsbury, N. Y.

R. V. S.—We should be much gratified to hear from you at your convenience.

W. WESTCOTT, New York.—Yes; it would meet with success if it can be done. Please write more definitely.

D. C. Read, New York.—Are snipe and woodcock shooting allowed in New Jersey, Long Island and Connecticut during July and August? Ans. Woodcock only. See table close seasons.

H. HERBERT.—Please tell me how to raise young partridges, as I have some just hatching? Ans. See FOREST AND STREAM, page 4, vol. 2.

D. W. G.—Will you please inform me if there is good fishing (trout) near Delaware Water Gap; if so, how far from it? Ans. At Broadhead Creeks, near Stroudsburg, about twenty miles.

CIRCLE, New York.—Will you please inform me where there is a reliable gunsmith in this city, as I wish to have my gun—an expensive one—thoroughly cleaned and put in order? Ans. E. H. Madison, 546 Fulton street, Brooklyn. He is a practical gun expert.

S. B., Albany.—Is there anything which will keep fleas away from a person in the woods? I am greatly troubled by them in my annual hunting excursions, and have found nothing effectual in driving them away? Ans. Nothing better than the Persian insect powder (*pyrethrum roseum*) recommended by British Medical Gazette, and for sale at druggists and rat poison stores.

R. T. M., Nassau.—What is the price of Fowler's hard rubber reel sold by Andrew Clerk & Co., size suitable for black bass of from one to six pounds weight? Do you recommend the reel? Ans. Price \$4.50. We prefer a nickel reel ourselves, but we never fish with less than a two ounce reel, and Fowler's weighs only an ounce. Different anglers have different opinions.

NASSAU, New York.—I see upland plover on some of our restaurant bills of fare and would like to know if such game birds can be shot this month. Your paper says "June close month for game." Where can these birds be found? Ans. Send in report of restaurant to the New York Sportsmen's Association. They are most likely shot in Virginia sitting on their eggs. Where is the best place to find woodcock within a reasonable distance of this city, and are there any good places in Connecticut? Ans. Warwick, Orange county; the drowned lands, Bain's Station on the Harlem Railroad. Note italics at the head of this column.

SUSAN MARY.—Please state how far it is in miles from Collingwood to Sault St. Marie by the steamship line advertised in your journal? Ans. Herewith find table of distances for the whole route: From Collingwood to Owen Sound, 45; Owen Sound to Killarney, 125; Killarney to Little Current, 26; Little Current to Bruce Mines, 111; Bruce Mines to Sault St. Marie, 40; Sault St. Marie to Michipicoton, 119; Michipicoton to Pic River, 103; Pic River to Neevigon, 107; Neevigon to Silver Islet, 74; Silver Islet to Prince Arthur's Landing, 22; Prince Arthur's Landing to Duluth, 198; total distance, 970 miles.

C. L. THUBER, Brooklyn.—Will you kindly inform me through the medium of your query column, first, if a boat can be hired without a guide in the Adirondacks; second, the probable charge per month; third, the address of a person keeping them? Ans. A man who is known to be peculiarly responsible and familiar with the woods can hire a boat without a guide at Paul Smith's, St. Regis; Bartlett's or Martin's, Saranac; Palmer's or Sabbatis', Long Lake; but these men are too careful to let a "greenhorn" go into the woods alone. Both man and boat might be lost. Suppose at least \$1 per day would be required at height of season, when all boats are in demand.

CIRCLE.—Which is the best route to the Thousand Islands? 2d. When is the best time to go there for fishing and shooting; what game and fish are in season? 3d. Where is the best place to stop? 4th. What would be the probable expense of a week's trip? 5th. Do you know of any party there with whom we could make arrangements? Ans. 1st. Take steamboat or cars to Albany, and Central Road from there to Rome. From Rome, Rome, Watertown and Ogdensburg Road to Cape Vincent, where you take steamboat direct to Alexandria Bay. 2d. No shooting, except in September, at ducks. Best masgkalonge and bass fishing in July, but good bass fishing in August. If very lucky may get a maskalonge, but doubtful. 3d. Thousand Island House, Alexandria Bay. 4th. Hotel, \$3 a day; guide, \$3 a day. Fare about \$20 to go. 5th. Write proprietors Thousand Islands House, Alexandria Bay, N. Y.

J. S., New York.—You pay no respect to our standing notice over Correspondent's columns. Were your long note not anonymous, we should be inclined to answer you by letter; however, the best advice we can give you as to any of the rivers you mention, or any other river, is to employ a good boatman familiar with the same; one who has been a river driver preferred by all means, who will make a capital pilot, and be able to assist and instruct you in many ways. An excellent point on the Delaware, to fit out with guide, provisions, &c., is Lackawaxen. You can try the shad there with fly, and take trout along down at brooks emptying into main river. No game in July except woodcock. Next to Delaware River, we should advise the Housatonic. Good stopping places all along, either for hotel fare or camping out. Your plan is the same that is advocated by our Canoe Club, and affords the most varied and enjoyable of pleasures. Read the cruise of the "Rob Roy."

FISHERMAN.—Having noticed a law that has recently been passed by the New Jersey State Legislature, prohibiting fishing in the Hackensack River, am compelled to ask you for more light on the subject. I have resided in Hudson county for many years, and enjoy the white perch and striped bass fishing hugely, and am told that my sport has ceased for the next three years to come. Knowing that you are posted on all fish laws in the States, think you can enlighten hundreds whether we can catch perch and bass as heretofore? Ans. As we read the law it applies only to salmon, salmon trout and black bass; for it says: it is not the intention to stop shad fishing, but when any of the above fish are caught in the nets, they must be put back or the penalty will be imposed. So also with regard to striped bass and white perch. The methods of fishing for these varieties are so different from those in vogue for the other fish, that we should suppose it to be a pure accident if any salmon, salmon trout or black bass were hooked, and if so hooked he should be thrown back. To perfectly assure yourself, write to Dr. Slack, Fish Commissioner, Bloomsbury.

READER, New Haven.—What would be the expense of a month's fishing in the vicinity of Youngwomanstown, Pa., four in party? 2d. Is a guide necessary; if so, what additional expense? 3d. Any flies particularly adapted to the streams of that section? 4th. Any book besides "Fishing in American Waters" that gives instruction in camp cooking? 5th. Would a gun be of any use from 15th June to 1st July? 6th. Do you know of any better place than the one referred to? Ans. Norris' "American Angler," and both of Roosevelt's books contain several pages on camp cooking, but you will have to borrow the latter, as they are out of print. Take your fly-book and use those flies the trout take best. Take a good gun, as "bars" and "cats" are about, and moreover you might get hungry and tired of fish. You must take the risk of violating the law, though the law don't require a man to starve, or rather a jury would acquit the offender. Expenses not more than \$2 per head each day. Would advise you to write to F. A. Maxwell, of Lovelton, Wyoming county, Pa., who is a first-rate hunter and guide. Guides are necessary in both sections.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

17 CHATHAM STREET, (CITY HALL SQUARE) NEW YORK,
[Post Office Box 2832.]
and 125 SOUTH THIRD STREET, PHILADELPHIA.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, JUNE 11, 1874.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal or private letters of course excepted.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.
CHARLES HALLOCK, Managing Editor.

WILLIAM C. HARRIS, Business Manager.

CALENDAR OF EVENTS FOR THE CURRENT WEEK.

FRIDAY, June 12th.—Goshen Park Association, N. Y.—Howard county Agricultural Society, Kokomo, Ind.—Valley City Association, Grand Rapids, Mich.—Yacht race, Tidal Wave vs. Madeleine—Chicago B. B. C. vs. Baltimore at Brooklyn.

SATURDAY, June 13th.—Harlem Boat Club's practice day, Harlem, N. Y.—Jerome Park races—Mutual B. B. C. vs. Boston at Brooklyn—Chicago B. B. C. vs. Baltimore at Baltimore.

MONDAY, June 15th.—Columbia Yacht Club regatta—Atlantic vs. Boston B. B. C. at Brooklyn.

TUESDAY, June 16th.—Brooklyn Yacht Club regatta—American Jockey Club races at Jerome Park—Syracuse Driving Park Association, Syracuse, N. Y.—Peru Trotting Park, Peru, Ind.

WEDNESDAY, June 17th.—Match day at Hoboken Cricket Grounds—Syracuse Driving Association, Syracuse, N. Y.—Horse Breeder's Association, Jackson, Mich.—Peru Trotting Park, Peru, Ind.—Schuylkill Navy regatta at Philadelphia.

THURSDAY, June 18th.—Long Island Yacht Club regatta—American Jockey Club races at Jerome Park—Schuylkill Navy regatta at Philadelphia—Syracuse Driving Park Association, Syracuse, N. Y.—Peru Trotting Park, Peru, Ind.—Horse Breeder's Association, Jackson, Mich.

TO THE PUBLIC.

EDWARD MOORE, who was formerly connected with the FOREST AND STREAM as canvassing agent, is no longer in the employ of this Company, his connection having ceased on the first day of May last.

ACTION OF PROJECTILES ON ANIMAL BODIES.

FROM a late number of the *British Medical Journal* we learn the results of some most interesting experiments made by the German Surgical Congress in regard to the action of bullets in the animal body. It seems that these studies were instigated by the Prussian Minister of War and an officer with arms, ammunition and soldiers, not to be shot at, but to shoot at animals, were placed at the disposition of the doctors. To us, having, thank God, nothing to do with the use of arms as a method of human destruction, the results of the labors of this commission as having to do with the effects of projectiles on animals will be undoubtedly instructive to our readers. Last year Professor Busch, of Bonn, drew attention to the fact that the Chassepot bullet when shot at a short distance into the human body made a simple aperture of entrance, but that its aperture of exit was larger than the fist, and that there was extensive fissuring and crushing of the bones. Dr. Busch supposed that the ball became melted and broken up by the forcible contact with a hard substance, and acted like a mass of shot on the parts lying behind. In the experiments made, animals were taken and behind them was placed a target, so that the condition of the bullet could be determined after passage through the animal. The distances of firing were from point blank to 800 paces. Sporting rifles, the needle gun, the Chassepot, Mauser, and Henry Martini rifles were used. The commission arrived at the conclusion that the action of a projectile on the living or dead animal was almost precisely the same as to disintegration of parts. As to the extent of the destruction it was in inverse ratio to the distance, and in direct relation with the initial velocity of the bullet. At 800 paces, although the peculiarities of the wound were the same, they were reduced in intensity. With small sporting rifles the bullets, though out of shape, remained in the body, though the military arms produced fearful destruction of the bones and soft parts. The most curious portion of the report is that relating to the change in the form, or cohesiveness of the ball, owing to the sudden changes of the temperature, caused by friction in the barrel, resistance to the air, and the heat caused by collision against a solid substance. It is well known that the bullet is broken up and mechanically divided. The particles of lead were found in the recesses of the wound, while fragments of various sizes passed out with pieces of the shattered bone.

To discover whether the heat was appreciable, a small bag of gunpowder was placed before the target. The bag was repeatedly torn by splinters of the balls, but no ignition of the powder took place. The question of the cohesion of lead was then experimented on, by taking two leaden balls, one cold the other hot, and dropping them at the same elevation on a stone, when the warmer ball was distinctly flattened. That a ball then must heat when it strikes the body of an animal, is but following the simplest of physical laws. Having this fact perfectly established, the peculiar injury produced in the animal body is perfectly explained. The bullet strikes against the bony structure, develops heat, and is disintegrated. The experiment showed that most of the bullets, after passing through the animal, made on the targets an irregular impression, surrounded by an aureole of smaller pieces of lead.

A very nice point comes in just here, and that is in regard to the relative action of hard and soft bullets on animals. When the Russians were fighting the Circassians, Schamyl's followers, for want of lead used copper balls. If we remember rightly, when we fought with Mexico, the Mexicans used occasionally the same metal. We use today, in almost all our arms of precision, leaden balls, which are swedged and considerably hardened. The Martini Henry, we think, uses a ball made of twelve of lead and one of tin. Hardened balls, then, when fired into animals, crush or radiate but very little. Dr. Künster states that in such cases splinters of hardened lead, or of the mixture of metals were rarely found. "If the edge of a rib was struck the loss of bone formed the segment of a circle corresponding to the circumference of a ball. Of two balls, one fired at 100 paces at a horse, and passing through the greater diameter of the animal, the Martini ball went clean through, while the Mauser ball remained in the carcass. The explanation was the greater resistance which the latter had to overcome by the misshapement of the ball, it being of a softer material." Now here the question arises as to the use of hard or soft metal, as projectiles for killing animals. It is difficult to form a very clear opinion of their positive action on the animal economy. If the harder ball goes clean through the animal the shock must be immense, but hardly less so is that of the softer bullet, which must inflict fearful internal injuries. In fact the softer ball seems to play the part of an explosive bullet, and at a close range, with such bullets, the effect must be almost the same, as if filled with a fulminate. Of course, in practical military surgery, questions of this character are of vital importance.

Sportsmen on the plains, when in pursuit of our large game, by noting the action of projectiles on animals, following, as it were, the track of the rifle ball, might add immensely to our stock of knowledge in regard to this subject, and army surgeons and the world at large might be benefitted with the information thus acquired.

AMERICA'S FUTURE FISHING GROUND.

OUR readers know how rapidly Michigan has grown into notice and favor of late as a superb angling region. All that rich and unexplored territory which sweeps from the Strait of Mackinaw to Saginaw Bay and from Thunder Bay to Grand Traverse, in whose primeval mazes even the lumberman is sometimes bewildered, has been found to abound in trout and to swarm with grayling, sometimes separate, sometimes occupying harmoniously the same stream. To these we add the rich stores of the great lakes Huron and Michigan, and of the upper peninsula with its grand fisheries, the waters of Marquette, and the south shore of Lake Superior, and where in any country can be found such an illimitable and inexhaustible field for the angler? To the four points of the compass from one grand focal point flow its great rivers, the Muskegon to the south, the Manistee to the west, the Cheboygan to the north, and the Au Sable to the east, with a dozen lesser streams like the Hersey, already famous for its grayling, the Au Gres, the Boardman, Rifle, Marquette and Jordan; and from these principal waters radiate countless ramifications of trout brooks and sparkling streams to where sunlight or

man have never entered. All of these secret places and intricate recesses are being gradually brought to light and knowledge by the construction of the Flint and Marquette railroad which traverses the interior of the State and has already reached Lake Houghton, itself swarming with monster fish. We are by no means skeptical of the future, and we venture to predict that within ten years Michigan will become and be known as the grand fishing ground of America, and be patronized by people from all parts of the world. Its streams are now crossed by fallen timber and choked with driftwood and brush, but those who shall hereafter enter its penetralia will clear these away and leave the water courses unobstructed and pleasant for the adventurous tourist. Then the birch and the dug-out can thread their sinuosities at will, and when the midday sun is hot, be grateful for the primeval shade that overshadows and shuts them in. There is no section where the people are waking up to their own advantages more than in Michigan, and the men who are leading the van of improvement are educated men, brawny pioneers in intellect as well as in muscle, with hard cash as well as hard fists, men who are going in to win. Now, for the north and east we have the Adirondacks; for the great west, the Yellowstone, and for the interior this new hunting and angling ground of Michigan, which is central to all. Hail Michigan!

THE HORSE, ARTISTICALLY AND DYNAMICALLY.

AN hippic rather than an artistic controversy is now raging in England, in regard to the exact way in which a horse walks. A Miss Thompson, heretofore unknown to fame, possibly the Rosa Bonheur of English animal life, from the realms of the unknown, has suddenly merged into a most notable personage. A picture by this lady called "The Roll Call," now exhibiting in the Royal Academy, has attracted immense attention, and in it is a horse which with three feet on the ground, has the fourth foot poised in the air. The all important question, (the general artistic merits of the picture being accorded) is, is this the proper position for a walking horse? The *London Times*, greatest of thunderers, has given columns to this discussion, and *The Field* and *Land and Water* devote no inconsiderable portion of their space to different authorities, who advance various facts and theories.

It has taken fully three hundred years to get entirely rid of the conventionally painted horse. It is wonderful how long the Archaic type has remained in permanence. After the noble frieze on the Parthenon, it seems as if man's conception of the horse had arrived at its apogee. Then the highest conception attained, art retrograded, just as statues of a certain date, all stone personifications of the human form, dwindled or became absurd after the glorious creation of a Venus of Milo. All the great Italian masters, even Julio Romano, drew fearful horses, and his traditional steeds, impossible as to anatomy and every thing else, with goggle eyes like those of human beings, rolling in a fine frenzy, were copied with Chinese accuracy almost to the close of the last century. Even to-day glaring inaccuracies in horse portraiture may be seen. In fact the beau ideal of the horse, as a model for the artist, may be said to have passed away. Phillip Gilbert Hammerton says in his most fascinating book, "Chapters on Animals," "The influence of the turf upon the physical perfection of the horse has not been favorable to his beauty. The race horse has lost the beauty of nature in one direction, as the prize pig has departed from it in another. The race horse has the charms of a tail-coat of a trained pear tree, of all such superfine results of human ingenuity, but he has lost the glory of nature. . . . No real artist would ever paint race horses from choice. . . . The meagre limbs, straight lines, and shiny coat, have slight charms for an artist, who generally chooses either what is beautiful or picturesque, and the race horse is neither picturesque nor beautiful." Here only the particular type of model chosen is criticised, but when one comes to what may be called the dynamic question in drawing a horse, the subject is a much more difficult one. Take half a dozen gentlemen, well known equestrians, and start the subject, to wit, how does a horse walk, trot or gallop, and in an instant a most lively discussion arises, in which not one will agree with the other, and their efforts to describe in plain language what they may have seen every day in their lives, is almost impossible to understand. The walking man was wonderfully studied by Dr. Oliver Wendell Holmes, and he illustrated his theory by a series of most clever sketches. The problem of walking resolved itself according to Dr. Holmes, into these two facts, that a man in walking divided his efforts into certain distinct acts, one was that he was trying to tumble down all the time, and the other was the continued effort on his part to pick himself up again. If the action of a man in walking is not easy to describe, the movement of the horse being more complex, is even then more difficult.

M. E. J. Marey of Paris, has perhaps devoted more attention to the subject of animal dynamics than any one else, and has invented a most ingenious instrument, which marks with absolute accuracy certain movements of animals. It must be steadily kept in the mind, that there are two series of observations to be noted in studying the action of a horse. At one period some of his feet are on the ground, at others in the air, and under peculiar circumstances, all his feet are clear of the earth. The track a horse makes is a positive picture, which can be seen on any road, but it is another thing to analyze the actual lifting in the air of each foot, and the time occupied when one foot is put down, and another lifted. M. Marey's ap-

paratus marks synchronously these movements, and represents as in the following diagrams the time of contact of the right foot by a continuous line, and of the left foot by a dotted line, and the exact period in the interval between the raising and lowering of either foot, by the gap between the succeeding lines.

Mr. A. H. Garrod in an article in *Nature* referring to M. Marey's book on the movement of a man or of a horse, describes them as follows:—

"Man in walking on level ground gives sufficient impulse to the body at each step to enable him to lift the one foot at the instant that the other touches the earth. Representing the time of contact of the right foot by a continuous line, that of the left by a superposed dotted line, and the period of the interval between the raising and lowering of either foot by the gap between the succeeding lines, the human walk on level ground would be drawn thus:—

.....

Whilst going uphill, however, there is a period during which both feet are on the ground together, which may be indicated thus:—

.....

Whilst, again, in running, there are periods, as we all know, during which both feet are off the ground together thus:—

.....

Turning to the case of the horse, and using the same method of illustration, it may be shown that any of its different steps may be imitated by two men, one behind the other. Now suppose these men, the hinder one with his hands on the shoulders of the one in front, to walk "in step," that is, with the right and left feet moving simultaneously; then, if their movements be recorded as above, with the steps of the hind man placed below those of him in front, the following would represent them:—

.....

.....

both would have their similar feet off and on the ground at the same time; and reverting to the horse, this formula as it may be termed, which represents the legs of the same side off the ground together, is that of the "amble," a method of progression natural to the giraffe, but only acquired by special training in the horse.

Again, suppose that two men, instead of walking "in step," do exactly the opposite, that is, place the *opposite* feet forward simultaneously; we then have the following formula:—

.....

.....

All will recognize this as the "trot" in the horse; although, as M. Marey has proved, there is always, in the true "trot," an interval between each of its two elements, during which all the feet are off the ground at once, thus:—

.....

.....

the upper of the last two formulæ, however, represents the walk of the elephant exactly.

In the amble and the trot, therefore, each complete series of steps is formed of two parts which never overlap; it follows that the sounds produced by them are double also.

The walk of the horse is a phenomenon a little more difficult to realize at first sight. Again referring to the two men, suppose that they walk quite out of step, as it may be termed, in such a way that the front one has raised his right leg at the same moment that the hind one is just raising his, although they keep to the same number of steps. Such being the case the sequence of the steps would be *right front, left hind, left front, and right hind*, which is the order of succession in the horse, and may be represented thus:—

.....

.....

In this formula it is seen that at no time are there more than two feet on the ground at the same moment, and M. Marey states that in his numerous experiments such is always the case, except when a load is being taken down an incline in a wheeled vehicle, on which occasion three feet may be on the ground simultaneously. In the walk of the horse there are therefore four sounds produced in each complete series of steps, and these four are at equal or nearly equal intervals of time.

In referring to Miss Thomson's picture, we are pleased to note that the highest authorities state that the position of her horse, in walking, three feet on the ground and one in the air is a correct one, though some little fault is found in the uplifted foot, which is stated to be too much in advance.

—Will some of our readers give us the names in English, French or German of any books they may be acquainted with on the trapping and treatment of birds, and in regard to the best methods of caring for aviaries?

THE EXODUS TO THE WOODS.—Summer heat and vacation days have come! Like the flight of the locusts and grasshoppers to green fields and pastures new, so do our angling friends "take to the woods." By daily receipt of numerous letters, we are constantly reminded of their departure. With a radiant smile of joyous anticipation, they waive us a graceful adieu and are off, while phantoms of huge fish flit before their expectant eyes, and the sprites of the cascades and fountains woo them on. Scores of them are indebted to us for directing their faces towards new fields of pleasure, and to the same persons do we and our readers owe much of the extended information of attractive resorts that we have printed the past year. We shall miss their weekly contributions for a while, but are consoled that during their absence they are gathering fresh material for the delectation and instruction of our readers in the winter days. There is the usual brigade for the Adirondacks with details for the White Mountains, Umbagog, and the salmon rivers of Gaspé, in Canada. Small delegations go to the Schoodic and the Sebec lakes, in Maine, to Michigan for grayling, and to the Nepigon, now famous. Scattering parties of two and three investigate the wilds of Pennsylvania and West Virginia, the clear lakes of Minnesota, the wilderness streams of Wisconsin, and the back lakes of Canada. A few have even gone to the river Margaree in Cape Breton, to the distant streams of Labrador, and to the head waters of the Saguenay, in Lower Canada. While a large body of unambitious, contented, well-to-do lovers of "mine angle" are well satisfied to stow themselves away in quiet nooks with their families, and to divide their time between casual recreation and siestas.

But there is a field still more remote than any of these, where only stout hearts and rough and ready natures go, where the vicissitudes of a single day are pregnant with hairbreadth escapes, and the game is as abundant and noble as the scenery is widespread and magnificent. Thither one-half of our most valued corps of writers have gone—Hayden, Coues, Batty, Henshaw, Yarrow, Marsh, Grinnell, Wheeler, Murphy, and scores of others well known to our readers by real name or *nom de plume*—and from the rich stores of Arizona, San Luis, and the Northern Boundary Survey, which they will collect, they have promised some modicum for FOREST AND STREAM.

But if there are those who "flee to the mountains," there is perhaps a larger proportion who go to the sea-side; and all summer long the placid blue waters of the sounds and bays are flecked with the white canvas of cruising and competing yachts, and the sail boats of the fishermen; the surf is dotted with the bathers, and the long beaches are odorous with clam bakes. From these seaside resorts our columns are supplied weekly with no niggardly hand or stinted measure, and until the advent of September gales we shall be the fortunate recipients of their favors. Then, from the mountains the sojourners there can exchange notes with those who dwell by the sea, and a sniff of the salt sea-breeze shall reach the dwellers in this rarified atmosphere of the hills; and the FOREST AND STREAM shall be the winged messenger to serve as the medium of the interchange.

Ah! the charms and the glories of the hills and the sea! They are not the portion of poor editors, always, or often. In vain they sigh for cool retreats, the gurgling brooks and breezy wildwoods, the seaward cruises, and the trolling along shore.

ILLINOIS STATE SPORTSMAN'S CONVENTION.—We are pleased to congratulate the field sportsmen of the great State of Illinois on the eminent success attending their first annual convention and tournament held near Chicago. The special novelty and the greatest attraction of the occasion was the show of pointers and setters owned by gentlemen, members and delegates from the different clubs in the State. It appears from our reports furnished us by our special correspondent that the judging of the animals was anything but satisfactory, and that the judges were unable to come to any direct conclusion as to which dog should be awarded the first premium. However, the showing of dogs in public has now been fairly started in the State of Illinois, and we trust to see next year, not only a dog show held at the annual convention, but a field trial over game, which is by far the best and in fact the only way to judge properly of the characteristics of a field sportsman's dog. We thought that the gentlemen connected with this association were perfectly conversant and had been furnished with all necessary information regarding the judging of dogs on the show bench, or else we should have been only too pleased to send them the latest rules and regulations on awarding prizes for pointers and setters.

In noticing the speech of President Le Moyne, before the assembled delegates, if words and emphatic language are of any avail as regards the protection of game and fish in his State, he plainly said that he believed he had the co-operation of over two hundred true sportsmen who intended by act and deed to put an end to this wholesale slaughter of game and fish, and that this killing of birds in large numbers in and out of season had been so destructive of late that shooting parties are now being made up in the State to go West.

We kindly return our thanks to the gentlemen sportsmen of the Illinois State Convention for the many courtesies extended by them to our special correspondent who sent us an immense amount of manuscript, which, owing to want of space, has been, we think, judiciously condensed by us.

—Don Platt seems destined to make Capital out of everything he handles.
